TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Seeds.

In the spring of the year, when the sowing of seeds is one of the many interesting operations of the garden lover, it probably seldom occurs to the sower what wonderful little bodies he is dealing with. When we consider that in the minutest seed, as in the largest, we have an inconceivably complex organisation embodying all the potencies of the particular species to which it belongs, and, possibly, more species than one, it becomes clear that its apparent simplicity of husk, germ, and associated nutrition covers a multitude of wonders. Its origin, to begin with, is wonderful. The parent plant which bears the seed has at first no sex, it is a structure consisting of stems and foliage, built up by a multitude of cells which have inherited the power of shaping themselves in diverse ways so as to produce the ancestral form. Presently, when the flowering period approaches, these discard the process of building up leaves proper, and create modified ones, which take the shape of petals, stamens, and stigmas. In doing so, the hitherto asexual plant splits its component cells up, as it were, into two sexes, one of which we see embodied in the pollen grains, while the other asserts itself either in the heart of the flower or beneath it in the ovary or future seed vessel. Here a very wonderful differentiation occurs in the cells, and not merely a sexual one. The ordinary cell multiplies itself by having what is termed a nucleus capable of splitting up into two, each division of which then becomes the centre of a new cell, which repeats the operation. Thus constituted, the cell is complete, and multiplies itself practically ad infinitum without external aid. When, however, the pollen and ovary cells are formed, their nuclei divide, and half is extruded or thrown out, by which operation the cells in each case lose the power of dividing again, and so multiplying in the usual way. Now, however, the plant, by innumerable contrivances, according to its kind, makes arrangements to bring these two half cells together, and so enable them by combination of the divided nuclei to resume the process of splitting up and multiplying. How this is done is very wonderful. One set of half cells may be very distant from the other; in fact, they may be on independent plants. A bee or moth seeking honey, gets its body powdered over with the one kind, the male, each pollen grain having within it the half cell in question. The insect flies away, and, visiting another flower of the same kind, leaves some of these pollen grains on the viscid stigma, and, lo! presently each one protrudes a tiny tube, in the tip of which is the half cell, and penetrating between the cells of the stigma, it traverses it, and eventually reaches the other half cell at its base in the ovary. At once the two half nuclei unite, the now complete cell splits up and multiplies, and, aided by the mother plant, forms one or two compact leaves, tightly packed into a shell, and bearing at their base the germ or bud, which eventually develops into another generation. Here we perceive that the seed begins with a single fertilised cell, and yet, when the seed is completed, and germinates, the cells then existent divide into two different classes, one set seeking the light and pushing upward, in order to expand its one or two primary leaves to its vital influence, while the other set, of precisely similar origin, plunges into darkness in the soil below to form the root system, and so supply the foliage above with the needful sap and earthy salts. Another wonder in connection with seeds is their diversity. Every species has its characteristic form of seed, ranging from the almost microscopically minute, up to the large seeds of the nut tribe. Another wonder is lost to us if we purchase seed by the packet, and do not collect it ourselves, and that is the diversity of the pods or other vessels which contain them. Then, again, there is the diversity of the contrivances plants have adopted to scatter their seeds abroad; some, like the poppies, sprinkling them around, as it were, from pepper castors, while others are winged, and wafted afar on the pinions of the zephyr. Obviously, as a little thought will show, we have but crossed the threshold of an infinite museum of wonders by taking seed as the text of our present note.

G M 760

MR. J. W. MOORMAN,
Superintendent of Victoria Park.

Mr. J. W. Moorman, whose portrait we have the pleasure of giving herewith, has obtained considerable prominence among horticulturists in the Metropolis as the result of the excellent work he has accomplished during the period he has occupied the important position of superintendent of the Victoria Park, which, by the way, is the largest of the parks belonging to the London County Council. A native of Devonshire, Mr. Moorman commenced his gardening career at Teignmouth, where he had charge of the garden of Miss Baring Gould, who was an ardent lover of Nature and a good botanist. Subsequently, he occupied positions in various private establishments, among them being Poltimore Park, Devonshire; Poyton Towers, Cheshire; and Sulby Hall, Northamptonshire. While at the last-named seat, Mr. Moorman was offered the charge of the gardens of Coombe Bank, Kingston-on-Thames; this offer he accepted, and remained in charge seventeen years. During his occupancy of this position, Mr. Moorman was a constant exhibitor at the principal London shows, and was especially successful with spring-flowering bulbs, roses in pots, and chrysanthemums. Two gold Banksian medals were awarded him by the Royal Horticultural Society for collections of hyacinths, tulips, and other bulbs, one in 1879, and the other in 1881. Mr. Moorman took part in the formation of the once famous Kingston Chrysanthemum Society, and was a member of committee until he left the neighbourhood. After leaving Coombe Bank, Mr. Moorman entered into an engagement with the Metropolitan Public Gardens Association, and was entrusted with the laying out of Myatt's Fields, the transformation of burial grounds into beauty spots, and other work of a kindred nature. On the transference of Myatt's Fields to the London County Council, in April, 1899, Mr. Moorman was appointed the first superintendent of this open space. The authorities were not slow to recognise his remarkable administrative abilities, and two years later he was promoted to Brockwell Park, and, after a stay there of about two and a-half years, was advanced to the position of superintendent of Victoria Park. Here Mr. Moorman has accomplished such splendid work that, although he has reached the age limit, he has, in the public interest, received an extension until June, 1910.

Opening of Kensington Palace Gardens.—The gardens of Kensington Palace were, for the first time, opened to the public on Saturday, the 8th inst. The alterations that have been made complete the improvements in the Palace and its environment originated by Queen Victoria, when the State apartments were opened to the public. The gardens have been completely transformed, and the old glasshouses, the frames, and potting sheds, in which the large stocks of bedding plants required for Hyde Park, Kensington Gardens, and the other open spaces associated therewith, have been removed. A new entrance has been made to the gardens near the statue of Queen Victoria, and this is connected with the Broad Walk by a gravel walk. Especially interesting is the sunk garden, which is enclosed by four low brick walls, with openings in the middle of each, flanked by stone-capped brick piers, and closed by small gates of wrought iron. Within the sunk garden is a lily pond containing the finest of the hybrid water lilies. The improvements that have been effected in these historic gardens testify in no uncertain manner to the taste and judgment of Mr. J. Gardiner, the superintendent of Hyde Park, Kensington Gardens, and St. James's Park.

Fruits of Foreign Growth were less plentiful in British markets during April than for several years past, the most important decrease being in the imports of apples. The total imports of these fruits was 158,090 cwt., of the value of £125,607, against 261,976 cwt., of the value of £180,042. The imports of apricots and peaches, 2 cwt., of the value of £9, as compared with 1 cwt., of the value of £2, in April of last year. Bananas were imported in increased quantities, the total having been 568,720 bunches, of the value of £156,057, these figures representing an increase in numbers of 92,985 bunches and in value of £23,272. There were decreases in the imports of lemons and in oranges, and an increase in the imports of nuts. The imports of grapes dropped from 5,536 cwt., of the value of £21,192, in April, 1908, to 3,428 cwt., of the value of £15,080 last month. Pears, on the other hand, were received in larger quantities, the aggregate having been 3,019 cwt., of the value of £4,544, or an increase in quantity of 1,153 cwt., and in value of £1,207. Relatively, the imports of plums show a large increase, the total imports having been 107 cwt., of the value of £526, against 8 cwt., of the value of £18, in the corresponding month last year. Gooseberries and strawberries, of which small quantities were imported in April, 1908, have no place in the returns for last month. Unenumerated fruits are of more than the usual interest from the fact that, while there was a decrease in quantity of 5 cwt., there was an increase in value of £1,028, the total imports having been 3,755 cwt., of the value of £6,110. The value of the fruits imported during April aggregated £747,660, or a decrease of £50,800.

Norfolk Park, Sheffield.—This fine open space has been presented to the Sheffield City Council by the Duke of Norfolk, and a notification was made at the meeting of that body on Monday last. Norfolk Park, which, according to the "Gardening Year Book," has an area of 61 acres, is the largest and most beautiful of the open spaces at Sheffield. It was laid out by the grandfather of the present Duke in 1841, and it has throughout this period been open to the public, and maintained entirely at the expense of the present Duke of Norfolk, his father, and grandfather. The value of the park is said to be about £60,006.

Economic Botany and Horticulture.—At the monthly meeting of the Scottish Horticultural Association, Dr. W. G. Smith gave a lecture on economic botany in its relation to horticulture. In his opening remarks Dr. Smith directed attention to the fact that the association had taken an active part in the early development of economic botany in Edinburgh about twelve years ago. Since that time economic botany had made great strides in Edinburgh, where there was now a number of lectureships upon it, and there was the same sort of advance to be found in other parts of the country. Under the heading of economic botany he included everything pertaining to the growth of plants and their diseases, etc. The agriculturist, he observed, seemed to have received better treatment than the horticulturist, as far as assistance from the authorities was concerned, for while these authorities provided for much instruction in agriculture, they did very little to help on horticulture. Dr. Smith then referred to recent progress in the study of inheritance, plant diseases, and other allied subjects. The lecture was illustrated by lantern slides, and was fully appreciated by the large audience.

Spring-flowering Bulbs at Birmingham. During the past eight or nine weeks the Birmingham parks have been aglow with the rich colours of the flowers of bulbous plants flowering early in the year, and those who have made several visits to these fine open spaces have had opportunities for the enjoyment of a succession of floral displays of great beauty. Snowdrops, scillas, and other bulbs that bloom at an early period were sufficiently numerous to produce a pleasing display, and they were quickly followed by the richly-coloured crocuses of Dutch origin, which produced, in the several parks, colour effects of surprising beauty. About 30,000 crocuses are annually planted, and of this large number about 10,000 have a place in the Cannon Hill Park. Later on hyacinths in their thousands yielded freely of their floral wealth, and flowering in association with, or in succession to them, daffodils and tulips contributed liberally to the floral attractions of the parks. The daffodils have been especially attractive, for of these 125,000 bulbs were planted in the beds and borders, the numbers in the several parks being Cannon Hill Park, 50,000; Summerfield Park, 18,000; Victoria Park, 16,000; Aston Park, 16,000; Ward End Park, 15,000; Highgate Park, 6,000; Calthorpe Park, 2,000; and Queen's Park, 2,000. Prominent among the varieties were Emperor, Empress, Horsfieldi, Sir Watkin, Barri conspicuus, Golden Spur, Mrs. Langtry and Cynosure. Of the tulips upwards of 50,000 bulbs were planted, and the most noteworthy of the varieties include Keizerskroon, Proserpine, Joost Van Vondel, La Reine, Cottage Maid, Prince of Austria, and Yellow Prince. Mr. W. H Morter, in thus providing for the entertainment of Birmingham's citizens, must be heartily congratulated on the splendid success he has achieved.

Daylight Saving Bill.—At a recent meeting of the Select Committee on this Bill, Mr. Walter Berry, a large fruit grower at Faversham, expressed the opinion that the Bill would have a highly beneficial effect upon the Kentish fruit industry. Large quantities of fruit were, he said, sent from Kent to the North of England, and strawberries gathered in the morning were delivered in Manchester and Liverpool at 2 p.m. on the same day, and the extra hour of daylight would enable shopkeepers and costermongers to dispose of them while they were fresh and saleable. The change would, he said, sometimes mean the saving of tons of fruit which would otherwise be wasted.

Vegetable Imports. — The increases and decreases in the imports of foreign vegetables were equally balanced last month. The most noteworthy of the decreases was that in the imports of potatoes, which aggregated 217,847 cwt., of the value of £96,669, as compared with 997,392 cwt., of the value of £256,386, in April, 1908. Of onions the imports amounted to 636,789 bushels, of the value of £122,378, these figures representing a decrease in quantity of 111,170 bushels, and an increase in value of £25,324. Tomatoes were received in increased quantities, the total having been 91,975 cwt., of the value of £73,721, and of unenumerated vegetables the value was £72,024, or an increase of £25,669.

Plants for the Leeds Children.—A sum of £75 has been granted by the Leeds Education Committee for the provision of plants for the children in the elementary schools. Aspidistras, ivies, fuchsias, pelargoniums, marguerites, and violas seem to be the favourite subjects. Over ten thousand bulbs were distributed last season, and six hundred packets of seeds this spring.

Curious Effect of Cross Pollination.—The following comes to us from America: Mr. Howard S. Hill, a cucumber grower, of Gardner, Mass., found an orange tree in blossom in his cucumber hot house some time ago. He transferred the pollen from the orange blossom to a cucumber blossom. As the cucumber grew it remained round, like an orange, but it had the skin of a cucumber. When ripe it assumed a bright orange colour, and was pleasant to the taste.

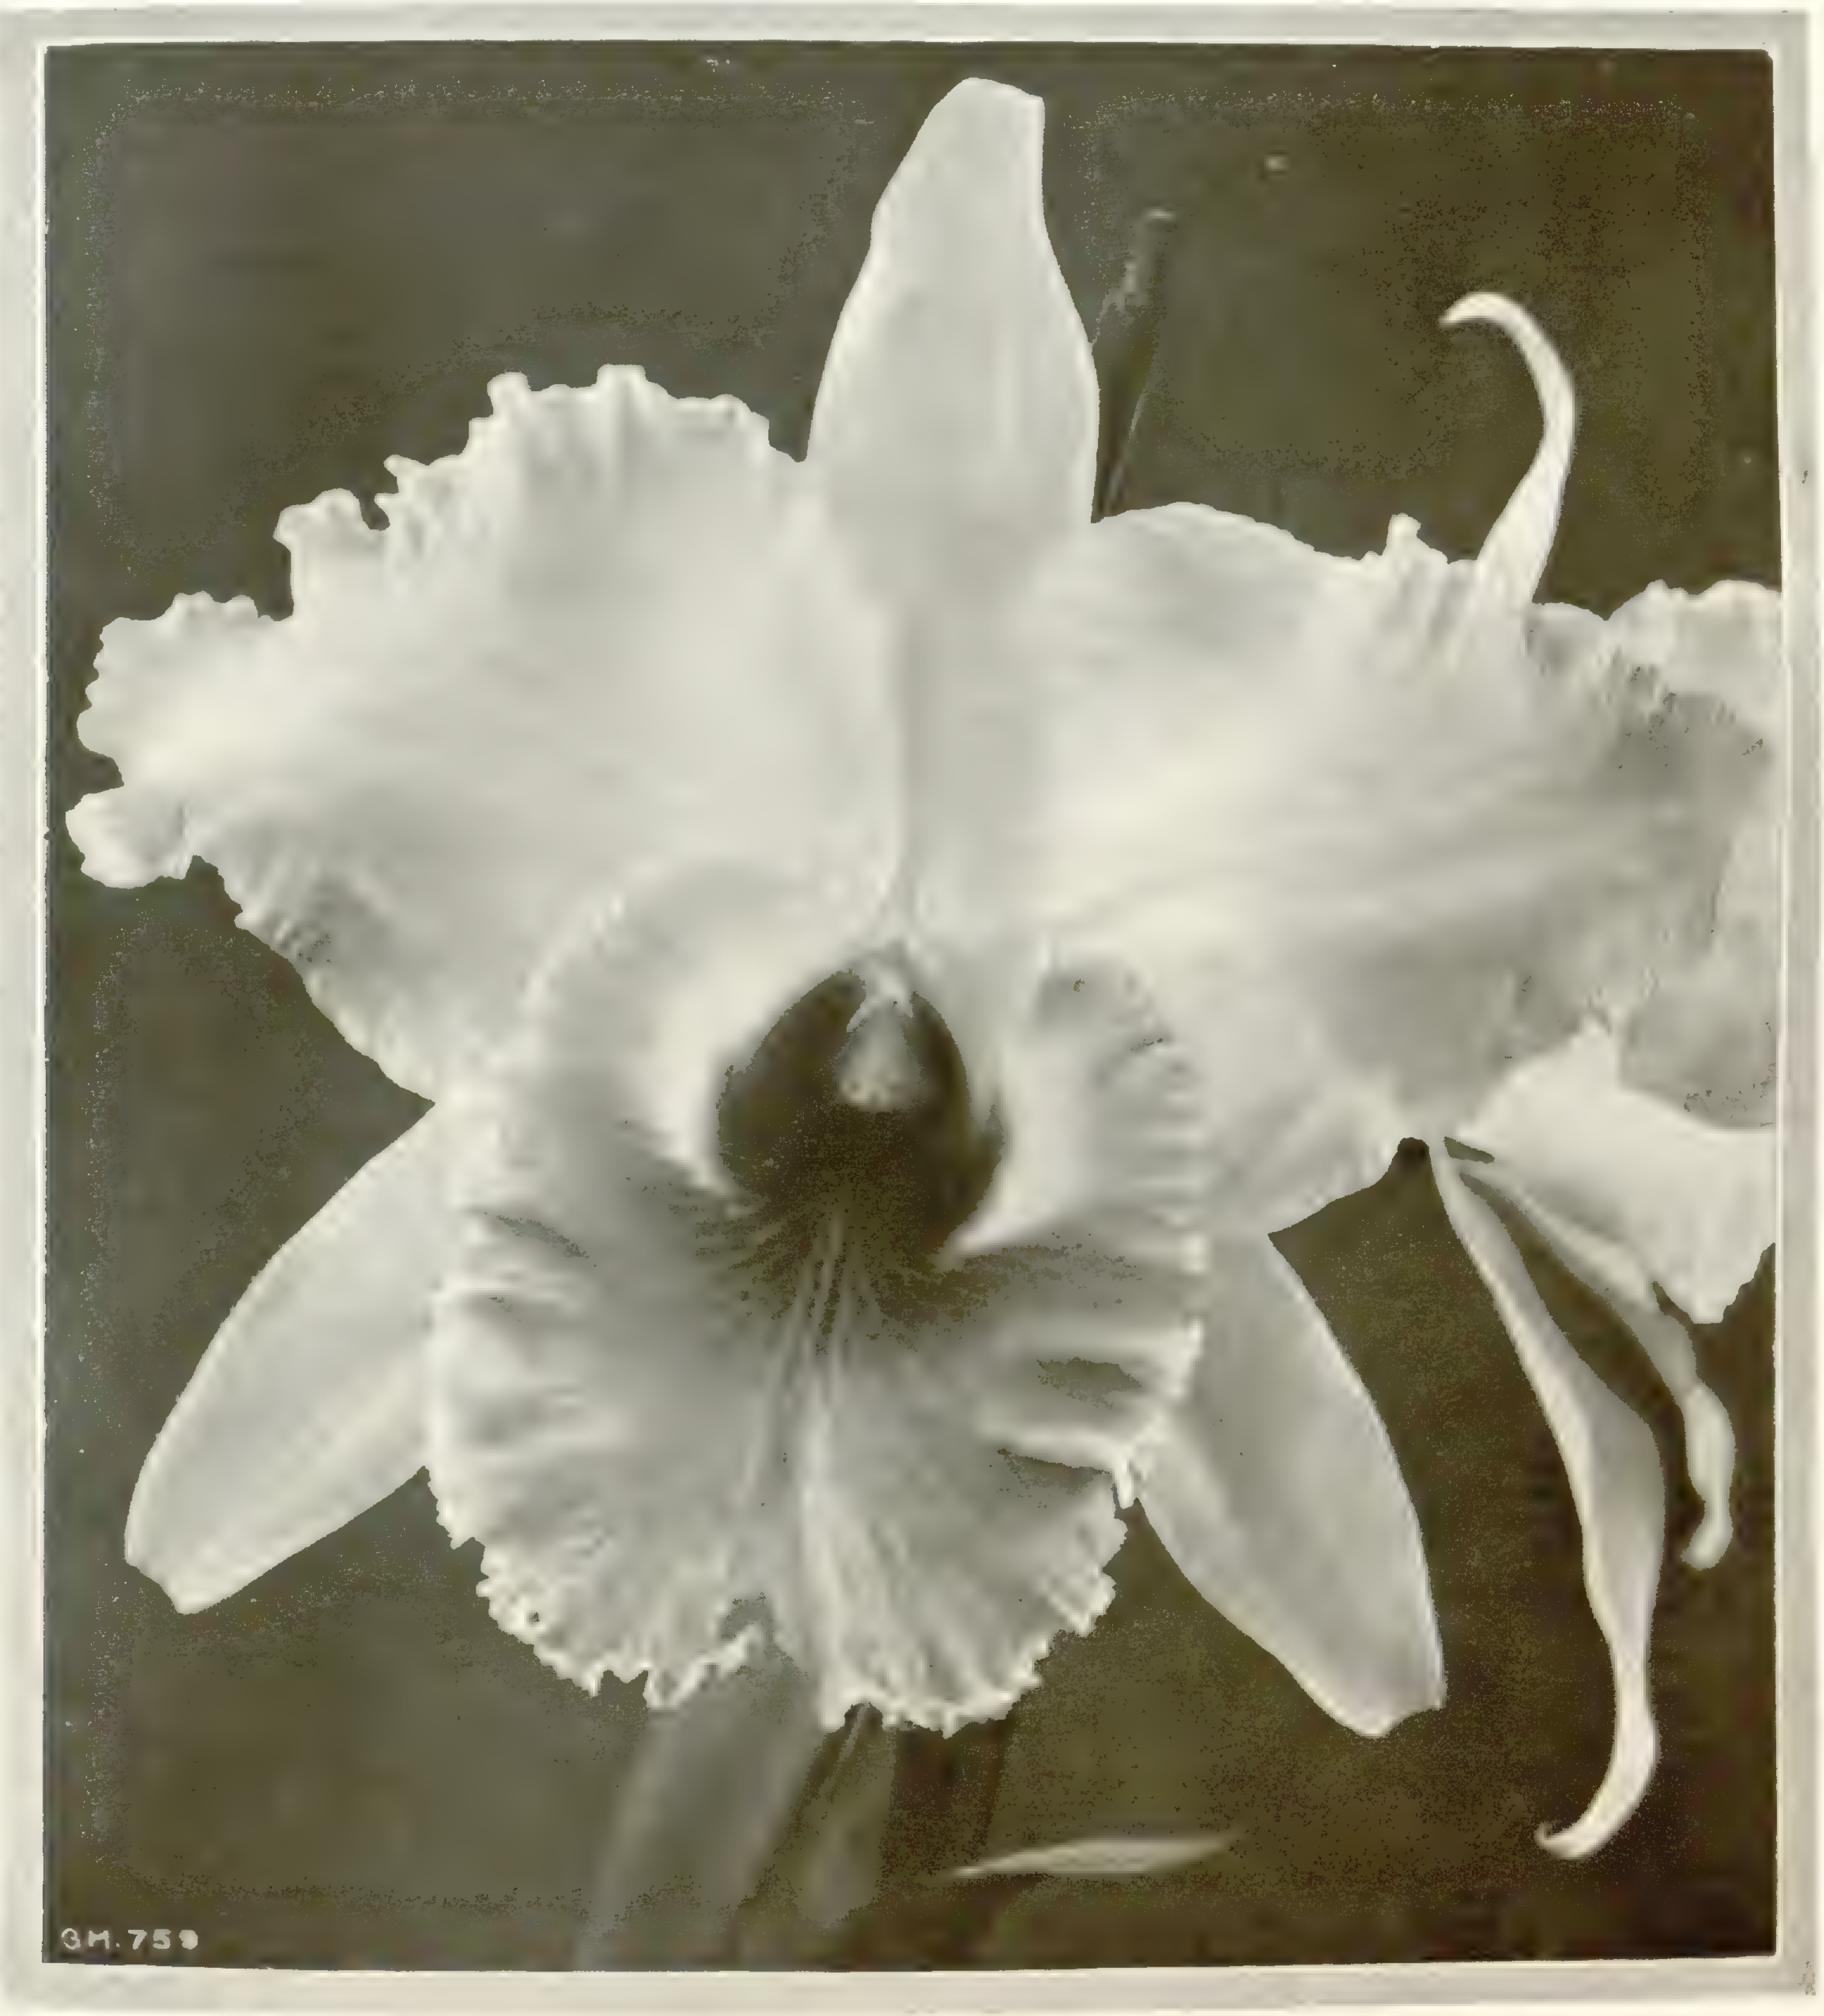
Kew Guild.—The annual meeting and dinner of the Kew Guild will be held at the Holborn Restaurant on May 25. The meeting will commence at 7.30 p.m., and the dinner will follow at the close of the usual business. It is requested that the members of the Guild who intend being present at the dinner, will at once communicate with Mr. Winn, the hon. secretary, Royal Gardens, Kew.

NEW PLANTS, ETC.

◆

LÆLIO-CATTLEYA DR. R. SCHIFFMAN WESTONBIRT VAR.

This marvellously beautiful orchid, obtained by crossing C. Mendeli with L.-c. Callistoglossa, has every attribute of a fine flower. It is large, substantial, of finest shape, and brilliant colouring. The fine sepals and petals are pale rosy-blush, and the large, broadly expanded lip is beautifully frilled, deep crimson purple, with gold lines and a yellow throat. It is one of the finest of orchids exhibited recently. F.C.C., R.H.S., May 4. Mr. H. G. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Tetbury, Gloucester.



LÆLIO-CATTLEYA DR. R. SCHIFFMAN WESTONBIRT VAR.

F.C.C., R.H.S., May 4. Lieut.-Colonel Holford, Westonbirt. Flowers soft pale rosy blush, deep crimson purple, and yellow.

VIBURNUM CARLESI.

This early-flowering, sweet-scented species of viburnum is quite hardy, and has proved its merit by standing all through the recent winter unharmed. It produces neat heads of white flowers, and makes a very attractive and useful shrub. We saw a plant flowering out of doors at Kew, near the pagoda, at the end of last week, and the specimen shown last Tuesday week was lifted from the open ground the previous day. An Award of Merit was granted to V. Carlesi on April 14, 1908, and the plant was figured in the Gardeners' Magazine of April 25, 1908, p. 323. It now gains the higher award. F.C.C., R.H.S., May 4. Mr. Bain, gardener to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking.

SAXIFRAGA CLIBRANI.

A strong-growing mossy saxifrage, bearing an abundance of deep red flowers on fairly stout stems. A.M., R.H.S., May 4. Messrs. Clibrans, Altrincham.

SAXIFRAGA DECIPIENS ARKWRIGHTI.

A large-flowered and very free mossy saxifrage, the flowers pure white. Some of the blooms are about three-quarters of an inch across. A.M., R.H.S., May 4. Messrs. Bakers, Codsall, Wolverhampton.

NEPHROLEPIS LYCOPODIOIDES.

This is a very beautiful form of the popular nephrolepises, and one in which the fronds are very finely and freely divided. The plumose character is so greatly developed that the fronds are like dense and beautiful moss. A.M., R.H.S., May 4. Messrs. T. Rochford and Sons, Broxbourne.

PRIMULA UNIQUE IMPROVED.

The plants shown under the above name are stronger than those originally shown as P. Unique at the Temple Show of 1908. The parents are P. Cockburniana and P. pulverulenta. We understand that P. Cockburniana was the seed parent of the first batch, and P. pulverulenta of the present batch of seedlings. The stems and leaves show in marked manner the influence of the latter species, while the flowers, with their orange and red colouring, show the influence of the brilliant P. Cockburniana. A.M., R.H.S., May 4. Messrs. Jas. Veitch and Sons, Chelsea.

HYDRANGEA HORTENSIS ALBA.

This pure white variety of a very popular plant should itself become popular. It carries large heads of pure white bracts. A.M., R.H.S., May 4. Messrs. Hugh Low and Co., Bush Hill Park, Enfield.

CINERARIA FLAVESCENS.

This elegant cineraria is a useful plant, but it is of chief interest because of its parentage and possibilities; indeed, it suggests that ere long we may have a yellow cineraria. The parents are Cineraria Feltham Beauty, and the golden-flowered Senecio auriculatissima. It is very free flowering, with comparatively small leaves, and heads of pale yellow flowers that quickly pale to cream and then to white. A.M., R.H.S., May 4. Messrs. Jas. Veitch and Sons, Chelsea.

GARDENS FOR GATHERING.

There are sentimentalists who hold that flowers should not be picked, that to pluck them is almost as cruel as caging some foreign bird and removing it to an atmosphere in which it is bound to die. The folly of this idea regarding blossoms may be realised when it is remembered that all shrubs need pruning, and that perennial and annual plants thrive best when often relieved of their blooms before fruiting and seed bearing. A row of sweet peas will soon become a mass of yellow stems and leaves alone unless treated in this fashion, for example. The truth is that gathering flowers is no more cruel or injurious than shearing a sheep. Yet, again and again have lady blossom lovers said to me, "Oh, flowers should be left growing, not be torn off and taken indoors to die." In summer heat, or in winter frosts, by the bye, gathered blooms last far longer in water indoors than when left to endure the effects of the weather.

To despoil the lawn flower beds is undoubtedly a mistake in policy, however, for the beautiful floral display should be guarded by all possible means, and blooms only be removed when past their best. It is useful, therefore, to plant portions of the garden for the supply of flowers for gathering, in order that the dwelling-rooms may be constantly adorned by the fairest, most perfect flowers. There is no better way to show these off to visitors during the intervals between public exhibitions.

Gardens for gathering ought to be comparatively large, so that space for full development may be given the different plants; when they are bound to be small only a few kinds of plants should be chosen, each year seeing some special subject chiefly represented. The salpiglossis is an excellent choice, so, too, are scabiouses, centaureas, and poppies. Perhaps the most useful family of perennials, after early chrysanthemums, is that of Chrysanthemum maximum, now that the named varieties show such wondrous variety of form. Hybrid pyrethrums are admirable, if cultivated so that there is a succession of bloom. Sunflowers are more monotonous. Michaelmas daisies, also, though of varied colours and sizes, have a sameness of effect. Where many large vases are to be constantly replenished a fine collection of lupins of all sorts, from the giant tree, in yellow or white, to the small blue or white annual, can be confidently recommended.

The position of the garden for gathering is immaterial, so long as it is in the open; a portion of the kitchen garden can form it if necessary, a section of a meadow be fenced in, dug up, and used for the purpose, or the appearance will be sufficiently good for it to consist of a series of borders and beds in the ornamental grounds, though not of the chief lawn beds.

Sweet peas need not be grown here, since wherever they are cultivated picking must be one of the rules for their welfare. Carpeting by dwarf plants is a mistake, since hoeing around and mulching will keep the chief subjects in better condition, and the number of dwarfs that yield satisfactory blossoms for vases is somewhat limited. Iceland poppies, pinks, and dianthuses, polyanthuses, cowslips, and primroses are indispensable in large quantities.

The best edging for the beds and borders will be tiles, because turf, box, or stones form hiding places for vermin; if slugs or snails are suspected of crossing the paths and entering borders it is a good plan to lay a continuous line of sharp cinders on the soil, exactly behind the tiles, which, if tall enough, will hide this.

Annuals that can be sown out of doors afford quick returns, but it should be recollected that transplanted asters, Phlox Drummondi, snapdragons, cornflowers, etc., come into blossom necessarily sooner. Single asters begin to flower in perfection in late summer, and should be largely represented.

Climbers for gathering are precious, yet often neglected; the Belgian and Dutch honeysuckles, various white and yellow jasmines, clematises, Solanum jasminoides, cobæas, tropæolums, Pyrus japonica, passion flowers are appreciated indoors in addition to roses. Only by generous plantings and sowings can a sufficient supply of foliage subjects, grasses, and myriad-blossomed small flowers, such as the gypsophilas, be kept up to accompany cut blossoms at all seasons. Ivies and hartstongue ferns, euonymus, laurustinus, golden privet, and Berberis aquifolium will prove best during winter; spring may have the fresh young foliage of the snowberry, columbines, etc., and summer and autumn must provide a wealth of waving grasses, together with the tinted leaves of amaranthuses, beets, and perillas.

M. H.

THE GARDEN LILACS.

Lilac-time is perhaps the period of the year that nine persons out of every ten would select as being the one when the outdoor garden is most enjoyable. The days are long, the sun is warm without being overpoweringly hot, young leaves on all sides present their most delicate shades, grass is rich in colour, and flowers abound on all hands. In the midst of this beautiful period it is difficult to imagine any particular plant forcing its presence on us without it is planted in quantity, yet wheresoever lilacs are flowering they are bound to attract attention, for, should their noble inflorescences escape notice, the delicate perfume of the blossoms is sufficient to recall our wandering senses.

The lilacs which attract most notice are the numerous single and double-flowered varieties, and hybrids which have originated from the two well-known species Syringa persica and S. vulgaris. Although lilacs will often grow and flower well year after year without attention, they sometimes become weak, and thickets of spindly growths. In such cases pruning is necessary, and what pruning is done should be done with care. As much as possible of the weak sucker wood ought to be thinned out, then the branches ought to be attended to, and the side growths thinned out. This should be done in early spring in order to obtain a lengthy season of growth. As soon as the shoots are a few inches long they should be thinned, leaving those only that are necessary for the proper development of the plant. This pruning and thinning may be persisted in for two or three years until the plants become strong again, but it must not be carried out too severely, or the bushes may be thrown into excessive flowering, which will do as much harm as would occur if the plants were left untouched.

As soon as the flowers are over it is a good plan to examine the bushes and remove the flower heads, for if seeds are left to develop the plants are seriously impoverished. This is more evident in the garden varieties, which produce immense trusses of flowers, than in the type plants.

The soil most suitable for lilacs is that of a good loamy character, though they are not very fastidious, providing that when growing in poor ground liberal surface dressings of good manure are given. Watering occasionally with liquid manure is attended with good results, especially when the buds are swelling up and young growth is being made.

The propagation of lilacs may be effected in a variety of ways. Cuttings can be rooted, branches may be layered, or the good varieties may be grafted on to stocks of the typical S. vulgaris.

S. vulgaris, the common lilac, is a native of Eastern Europe, and is a widely cultivated plant. Some considerable difference can be detected in type specimens when in flower, particularly in the size and shape of the inflorescence and the colour. A difference in habit occurs also, the wood of some forms being much sturdier than that of others. As a rule, examples are met with in which several main stems spring from a common root-stock, but occasionally a single trunk occurs, with a good-sized head. Such an example may be seen near the Palace, at Kew. This particular specimen is historically interesting, as having been brought originally from the ancestral home of the Hesse family, Rumpenheim-on-the-Main, near Frankfort. For many years this and a fellow plant grew in the garden attached to Cambridge Cottage, the residence of the late Duke of Cambridge. A year or two ago, however, they were transplanted, one being sent to Windsor and the other placed in its present position at Kew. An account of the introduction and history of these specimens may be read in the "Kew Bulletin" for 1908, No. 2, p. 82.

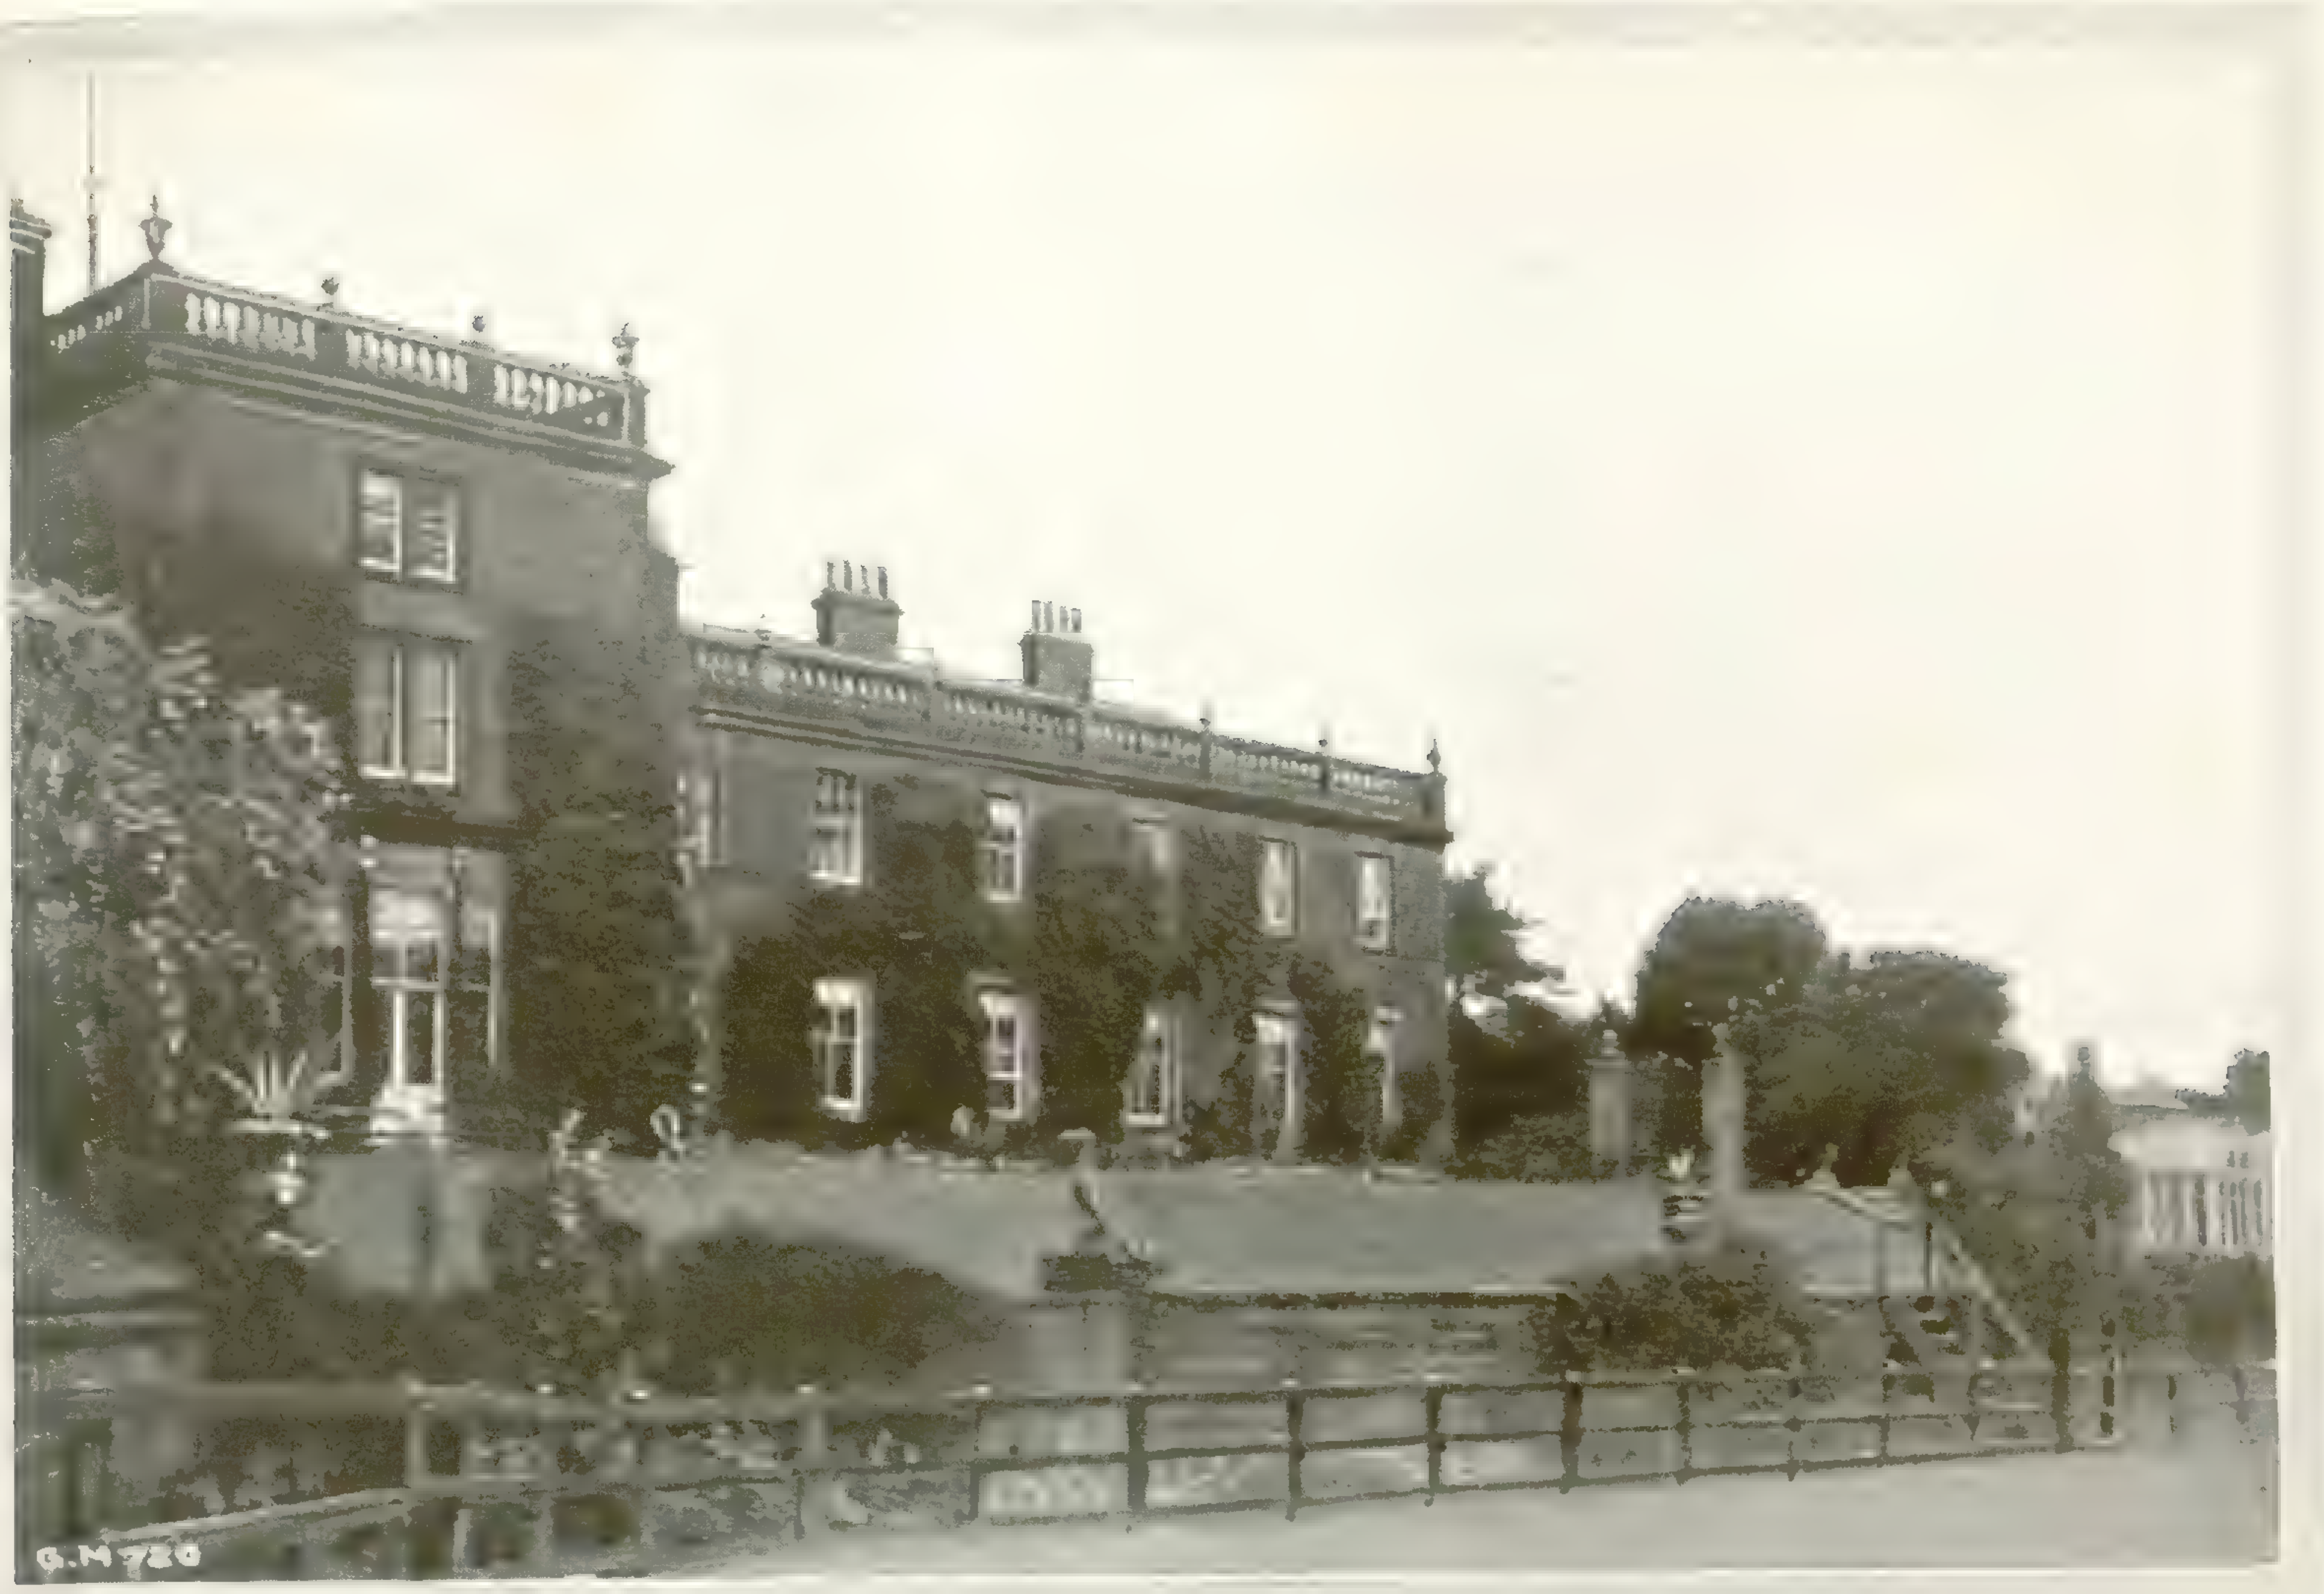
S. vulgaris varies considerably in height, and may be met with varying from 10 to 18 or 20 feet in height. The varieties are many, and present a wide range of colour, some being white, others pale lilac, others again deep lilac, some almost red, others purplish, and one or two with quite a bluish tinge. The flowers vary in size considerably, whilst a large number have double flowers. Of the many varieties, the following are distinct and worthy representatives:

Varieties with single white flowers.—Alba grandiflora, Marie Legraye, Virginalis, Frau Bertha Dammann, Noisettiana. Of other colours, single, Charles X., rose-purple; Dr. Lindley, rosy-purple; La Ville de Troyés, purplish-red; Philemon, dark red; Delphine, bluish-lilac; Souvenir de L. Späth, dark red; and Toussaint Louvretre, dark red. Double varieties.—Alphonse Lavallée, bluish-violet; Doyen Keteleer, pale rose; Dr. Masters, lilac; Emile Lemoine, rose; Grand Duc Constantine, lilac; Madame Casimir Perier, white; President Carnot, lilac; Madame Lemoine, white.

S. persica, the Persian lilac, is a native of Persia and Afghanistan. It forms a rather dense bush, four to six feet high and as far through, with rather small ovate-lanceolate leaves and elegant inflorescences of lilac-coloured flowers. It is an extremely free-flowering plant, and is excellent alike for masses or for isolated specimens. Several varieties are known, the most distinct being alba, with white flowers, and laciniata, with deeply cut leaves. It has been crossed with the common lilac, and a very good hybrid has resulted in S. chinensis, the Rouen lilac. This grows 12 or 14 feet high and as far through. The inflorescences, though larger, resemble those of S. persica rather than those of S. vulgaris, and they are borne with the greatest freedom. It is in every respect an excellent shrub, and ought to be represented in every garden. It is quite probable that some of the so-called varieties of S. vulgaris have a trace of S. persica blood in them.

W. Dallimore

Kew.



HOLEYN HALL, WYLAM-ON-TYNE: THE GARDEN FRONT.

SOME GARDENS ROUND NEWCASTLE—II.

Holeyn Hall.

A near neighbour of Mr. Cookson's is the Hon. C. A. Parsons, whose residence, Holeyn Hall, is half a mile further along the road that leads past Oakwood. The Hall stands on high ground, and commands numerous pretty views across the Tyne valley. It is a substantial stone house, built on a long terrace. The walls are amply furnished with big roses, jasmines, cotoneasters, ornamental vines, and ivies. All these grow in a narrow border that is also well furnished in summer with a combination of hardy perennial and tender plants. The broad terrace walk terminates towards the front entrance in a magnificent pair of iron gates brought home from Italy by Mrs. Parsons. Very beautiful is the design of vine growth, leaves, fruit, and tendrils, and it is exquisitely worked, the whole forming a fine finish to the terrace, and making a garden ornament at once interesting, novel, and handsome.

The terrace is held up by a low wall, and there is a grassy slope between it and the terrace walk. Stone storks and handsome vases surmount the wall, and the latter is being covered with roses and jasmine, while in the border, at its foot, are large breadths of alpine phloxes, veronicas, and other dwarf alpine and hardy herbaceous plants. Near the vine gates, and surrounded by roses and choice flowering trees and shrubs, is a pretty glasshouse that serves the double purpose of conservatory and smoking-room. Easy chairs and rugs invite one to stay awhile; overhead are roses and a fine old Tacsonia Van Volxemi, with its bright pendent blooms; at the back are great masses of Streptosolen Jamesoni, and all around are bright and fragrant flowers, lilies always occupying a prominent position.

Beyond the Hall and its terrace front the broad walk is continued for a considerable distance, but the continuation is masked by a very big arched laburnum, and tall trees on either side, and it provides a bold stretch of garden quite distinct from the other part. Fine deodars, Atlantic cedars, beeches, limes, and English and Irish yews make a grand and graceful background for sweeping borders of hardy flowers, for the bold beds, and the lawns. Hardy perennials are a great feature, and many of the beds are filled with them. Montbretias, Galtonia candicans, campanulas, delphiniums, liliums, and pyrethrums grow finely and bloom profusely. A few beds are devoted to Lobelia cardinalis and begonias, while others are filled with H.P. and H.T. roses, and there is a rose pavilion where the robust climbers display themselves to great advantage. Celosias, stocks, nicotianas, and calceolarias are also used, but the tender subjects are not obtrusive, and the big agaves in the tall vases serve to mark certain points of view.

This broad extension of the terrace is a fine feature, and is quite a surprise to anyone coming from the Hall front. Another surprise is the rock garden, also screened by the tall trees, near the rose pavilion. No attempt has been made to provide a big collection of alpines, but the aim has been to afford ample room for the finest and most attractive subjects. There are splendid masses of the more popular saxifrages, alpine phloxes, and alpine and shrubby veronicas, the latter including a very large V. cupressoides; Acæna microphylla, thickly studded with its red burrs is also a great success. The claims of aquatic plants have not been overlooked, and within the rock garden there is a little pool of water lilies and Aponogeton distachyon.

Further along still one enters the kitchen and fruit departments, these consisting of a series of terraced and walled-in gardens. Hardy fruits are not a success everywhere in the district, owing to the force of the biting winds that sometimes rage with great fury down the Tyne valley. At Holeyn Hall, however, hardy fruits are a good feature, and Mr. Dixon takes full advantage of the walls for the purpose of growing plums, pears, cherries, apples, etc. Even the gooseberries and currants appreciate the shelter these walls afford, and the considerable breadths of these fruits are in fine condition. In the lower part of the garden the young standard apples promise well, and some old trees continue to give good crops. Apricots, on a wall facing south, are particularly successful, and the trees are by no means young. Fan-trained plums carry excellent crops, Denniston's Superb deserving special mention. The most popular wall pears are Williams' Bon Chretien, Jargonelle, Marie Louise, Durondeau, Pitmaston Duchess, Emile d'Heyst, and Doyenne du Comice.

Under glass, too, fruits are well managed, and one might go a long way south to find better Humboldt, Pitmaston Orange, and Pineapple nectarines, and Violet Hative and Royal George peaches. Some serviceable vineries supply excellent fruits, but Mr. Dixon has to wage constant warfare against rats, or these pests would quickly rob the vines of their grapes. Stout zinc discs are placed around the lower part of each rod to prevent the rats from climbing, should they get into the house. One interesting house is filled with roses, trained peach tree fashion on wires near the glass, while against the back wall sweet peas are grown to give early blooms. The kitchen and fruit gardens are not given over entirely to vegetables and fruits, though these have chief place. Toward one side of the garden a broad walk descends parallel with the wall; it is bordered by robust hardy herbaceous plants that supply the Hall with cut flowers; and at intervals there are arches of Dorothy Perkins rose, a variety as popular as ever Crimson Rambler was, and one that is far more beautiful, even if it lacks the brilliancy of the older favourite.

Willow Wood.

A few miles farther up the river than Wylam is the village of Riding-Mill-on-Tyne, and here, on the south bank of the river, is the residence of Drewett O. Drewett, Esq., a gentleman well known among orchid lovers for his fine collection of cypripediums and for the pains he has taken to improve the popular C. insigne by crossing, re-crossing and selection, but still keeping the species pure. It is just possible that there are finer views up the Tyne valley than are to be obtained from Mr. Drewett's study, or from the drawing-room windows of his fine house, but I think they would be difficult to find. Anyway, the scenery is beautiful, and the views extensive, and if there were not any other attractions, it would have been well worth while to build a house and set up a home here for the sake of the views.

The river, often flowing with great speed, comes down from among the far distant hills and curves round to take up a position in the middle of the picture. On either side of the river the banks slope easily upward to fairly high ground. Trees of many kinds abound, and add very materially to the beauty of the scene, while the different kinds of soils, and the varied hues of cultivated land and pasture all add their meed of colour. Mr. Drewett can hardly decide when the picture is at its best. In the spring, when shine and shower chase each other across the valley, and when the trees are breaking into new life, the scene has an exquisite charm. In the golden summer time the colouring is deeper, and there is a wonderful play of light upon the shallows. In autumn a new and brilliant scene is made by the change of colouring among the oaks and beeches and birches. And in the winter, with the trees bare, there is a majestic beauty in the picture when the swollen river is in full flood.

There is as great, or greater variety of scene and colour in the garden around, as the procession of months advances, as in the wonderful view up Tyneside. A goodly collection of choice and beautiful flowering trees and shrubs has been brought together, and many of these are grouped within view of the house. The rock garden is almost at the front door, and so the exquisite beauty of the early alpine flowers can be enjoyed from inside the windows if the weather is unkind. Sedums and saxifragas spread themselves lovingly over the stones, and such beautiful flowers as Androsace sarmentosa, Gentiana acaulis, and Cyclamen europæum, thrive in a whole-hearted manner, the gentian being particularly fine. Romneya Coulteri grows well near by, and a tall Cordyline australis, raised by Mr. Drewett, and planted out, shows that the garden is sheltered from the bleakest winds.

Coniferous trees are plentiful, and there are numerous handsome specimens, including a fine Sequoia gigantea. Several of the bamboos are a success near the little lily pool. B. Metake and B. fastuosa do well here. In the middle of the pool, on a rock, is a large clump of Hemerocallis aurantiaca major, that proves the suitability of the Day lilies for association with water gardening. The stream that feeds the pool comes along a very rocky channel; it appears to come from out a group of rhododendrons, and it murmurs along among a variety of hardy ferns. Mr. Drewett is a great lo hardy ferns, and he has a great bel in the coming popularity of the finer varieties of these elegant plants. He has a goodly collection of the choicer forms, and i steadily adding to it.

In quite another part of the garden, and at some distance from the house, are th neat glass-houses, and the admirably-k fruit and vegetable quarters, and the l ders filled with early chrysanthemums grandly grown—asters, dahlias, roses, other useful subjects that serve to fill flower vases. It sounds rather strange but it is nevertheless a fact, that the kitchen garden is hedged with roses. Everything is beautifully kept by Mr. Ja Renwick, the energetic head gardener, who was formerly at Oakwood, as foreman, under Mr. H. J. Chapman.

Very much might be written about Mr. Drewett's garden, but I must leave a great deal to the reader's imagination, because the orchids demand their share of attention, whatever else is left out. The glass-houses consist of a range of very well-built span-roofed houses; there are stove and greenhouse plants in variety, and in passing, I may mention that tuberous begonias lapagerias, anthuriums, amaryllis, and Begonia Gloire de Lorraine are subjects concerning which Mr. Renwick concedes a few points to the majority of growers.

Orchids there are in abundance, but cattleyas, oncidiums, phaius, dendrobiums, and odontoglossums must all be passed with a mere mention of their existence. This is the home of a cypripedium specialist, and as the genus cypripedium is itself a tall order nowadays, Mr. Drewett has devoted his attention chiefly to C. insigne. Having decided to try and improve this popular old orchid, Mr. Drewett commenced by fertilising C. i. punctatum violaceum, with C. i. Chantini, these being the only varietal forms at that time, and they were al indistinguishable. The result was a two hundred seedlings, none inferior to th

VIEW IN THE FLOWER GARDEN AT HOLEYN HALL.

seed parent, and some much finer, while one, subsequently named C. i. Antares, was far in advance. It has a large, rounded and flat dorsal sepal, almost as large as C. i. Aberdeen, and covered with dark spots.

The fine C. i. Monarch was crossed on to C. i. punctatum violaceum, and three of the seedlings had flowers that were of good size, and with the dorsal sepal less reflexed at the base than in the parents, and had the broad part nearer the apex; one of the three had an almost round dorsal sepal. These varieties were named Monarch II., Monarch III., and Northumbria. Personally, I like the latter best. All the seedlings were finely spotted, and one, Grand Monarch, has a much flatter flower than the rest, while the colouring of the dorsal sepal is like that of C. i. punctatum violaceum. The lip and petals are deep rich chocolate-red, thus forming a very striking, distinct, and beautiful flower. From C. i. Wallacei, crossed with a richly coloured unnamed seedling, came one plant that showed a marked difference in its leaves at an early stage, and consequently it was carefully watched. This gave a flower with very large, bold spots, and the colouring of C. i. punctatum violaceum, and it was named C. i. Gwynedd. It is a grand cypripedium. Another fine seedling, named James Renwick, has resulted from crossing C. Berryanum with C. i. Harefield Hall, and it received a F.C.C. at Manchester in December last.

ARCH OF DOROTHY PERKINS ROSE IN THE KITCHEN GARDEN AT HOLEYN HALL.

All this improvement (and much more) has been effected within about ten years, and nothing but the very best seedlings in form and colour have been retained. The vigour of the plants is surprising, and it is an easy matter to believe that in the C. insigne houses from 400 to 600 flowers could be counted any day during a period of about four months. Twenty years ago the mere suggestion that one could take an orchid species, and, by intercrossing and selection, improve it as a florist improves his carnations and chrysanthemums, would have been scoffed at, but the thing has been done, and the work is being continued, as seedlings can be seen in all stages of growth.

There are other fine cypripediums here, such as C. Germaine Opoix, C. i. Harefield Hall, C. Euryades, C. Actæus Drewett's var., C. Gaston Bultel, C. Minos Youngi, C. Æson giganteum, etc., and a batch of C. Fairieanum crosses that looks very promising. But I must conclude, only stopping to notice that Mr. Drewett uses triangular pieces of glass for orchid labels, and writes the name, number, or parentage with a diamond.

Heaton Park.

Very few cities are blessed with such a fine series of public parks as is Newcastle. When we think of this northern city, we think of coal and its attendant dirt and dust, of great foundries and engine works, and of the clang and clatter of shipbuilding, but we rarely associate the idea of beautiful parks and gardens with Newcastle. Nevertheless, the parks, commencing with Heaton Park and finishing up with Jesmond Dene, form a series probably unequalled in the United Kingdom for natural beauty.

Heaton Park is readily reached by tram from the centre of the city. It is largely used as a playground. Close to the entrance gates are several bowling greens that are well kept and thoroughly well patronised. Steep winding walks, all asphalted to keep them from being washed out by heavy rains, lead down among useful evergreen and flowering shrubs, under deciduous trees of many kinds, to the lower level, where there are other fine bowling greens.

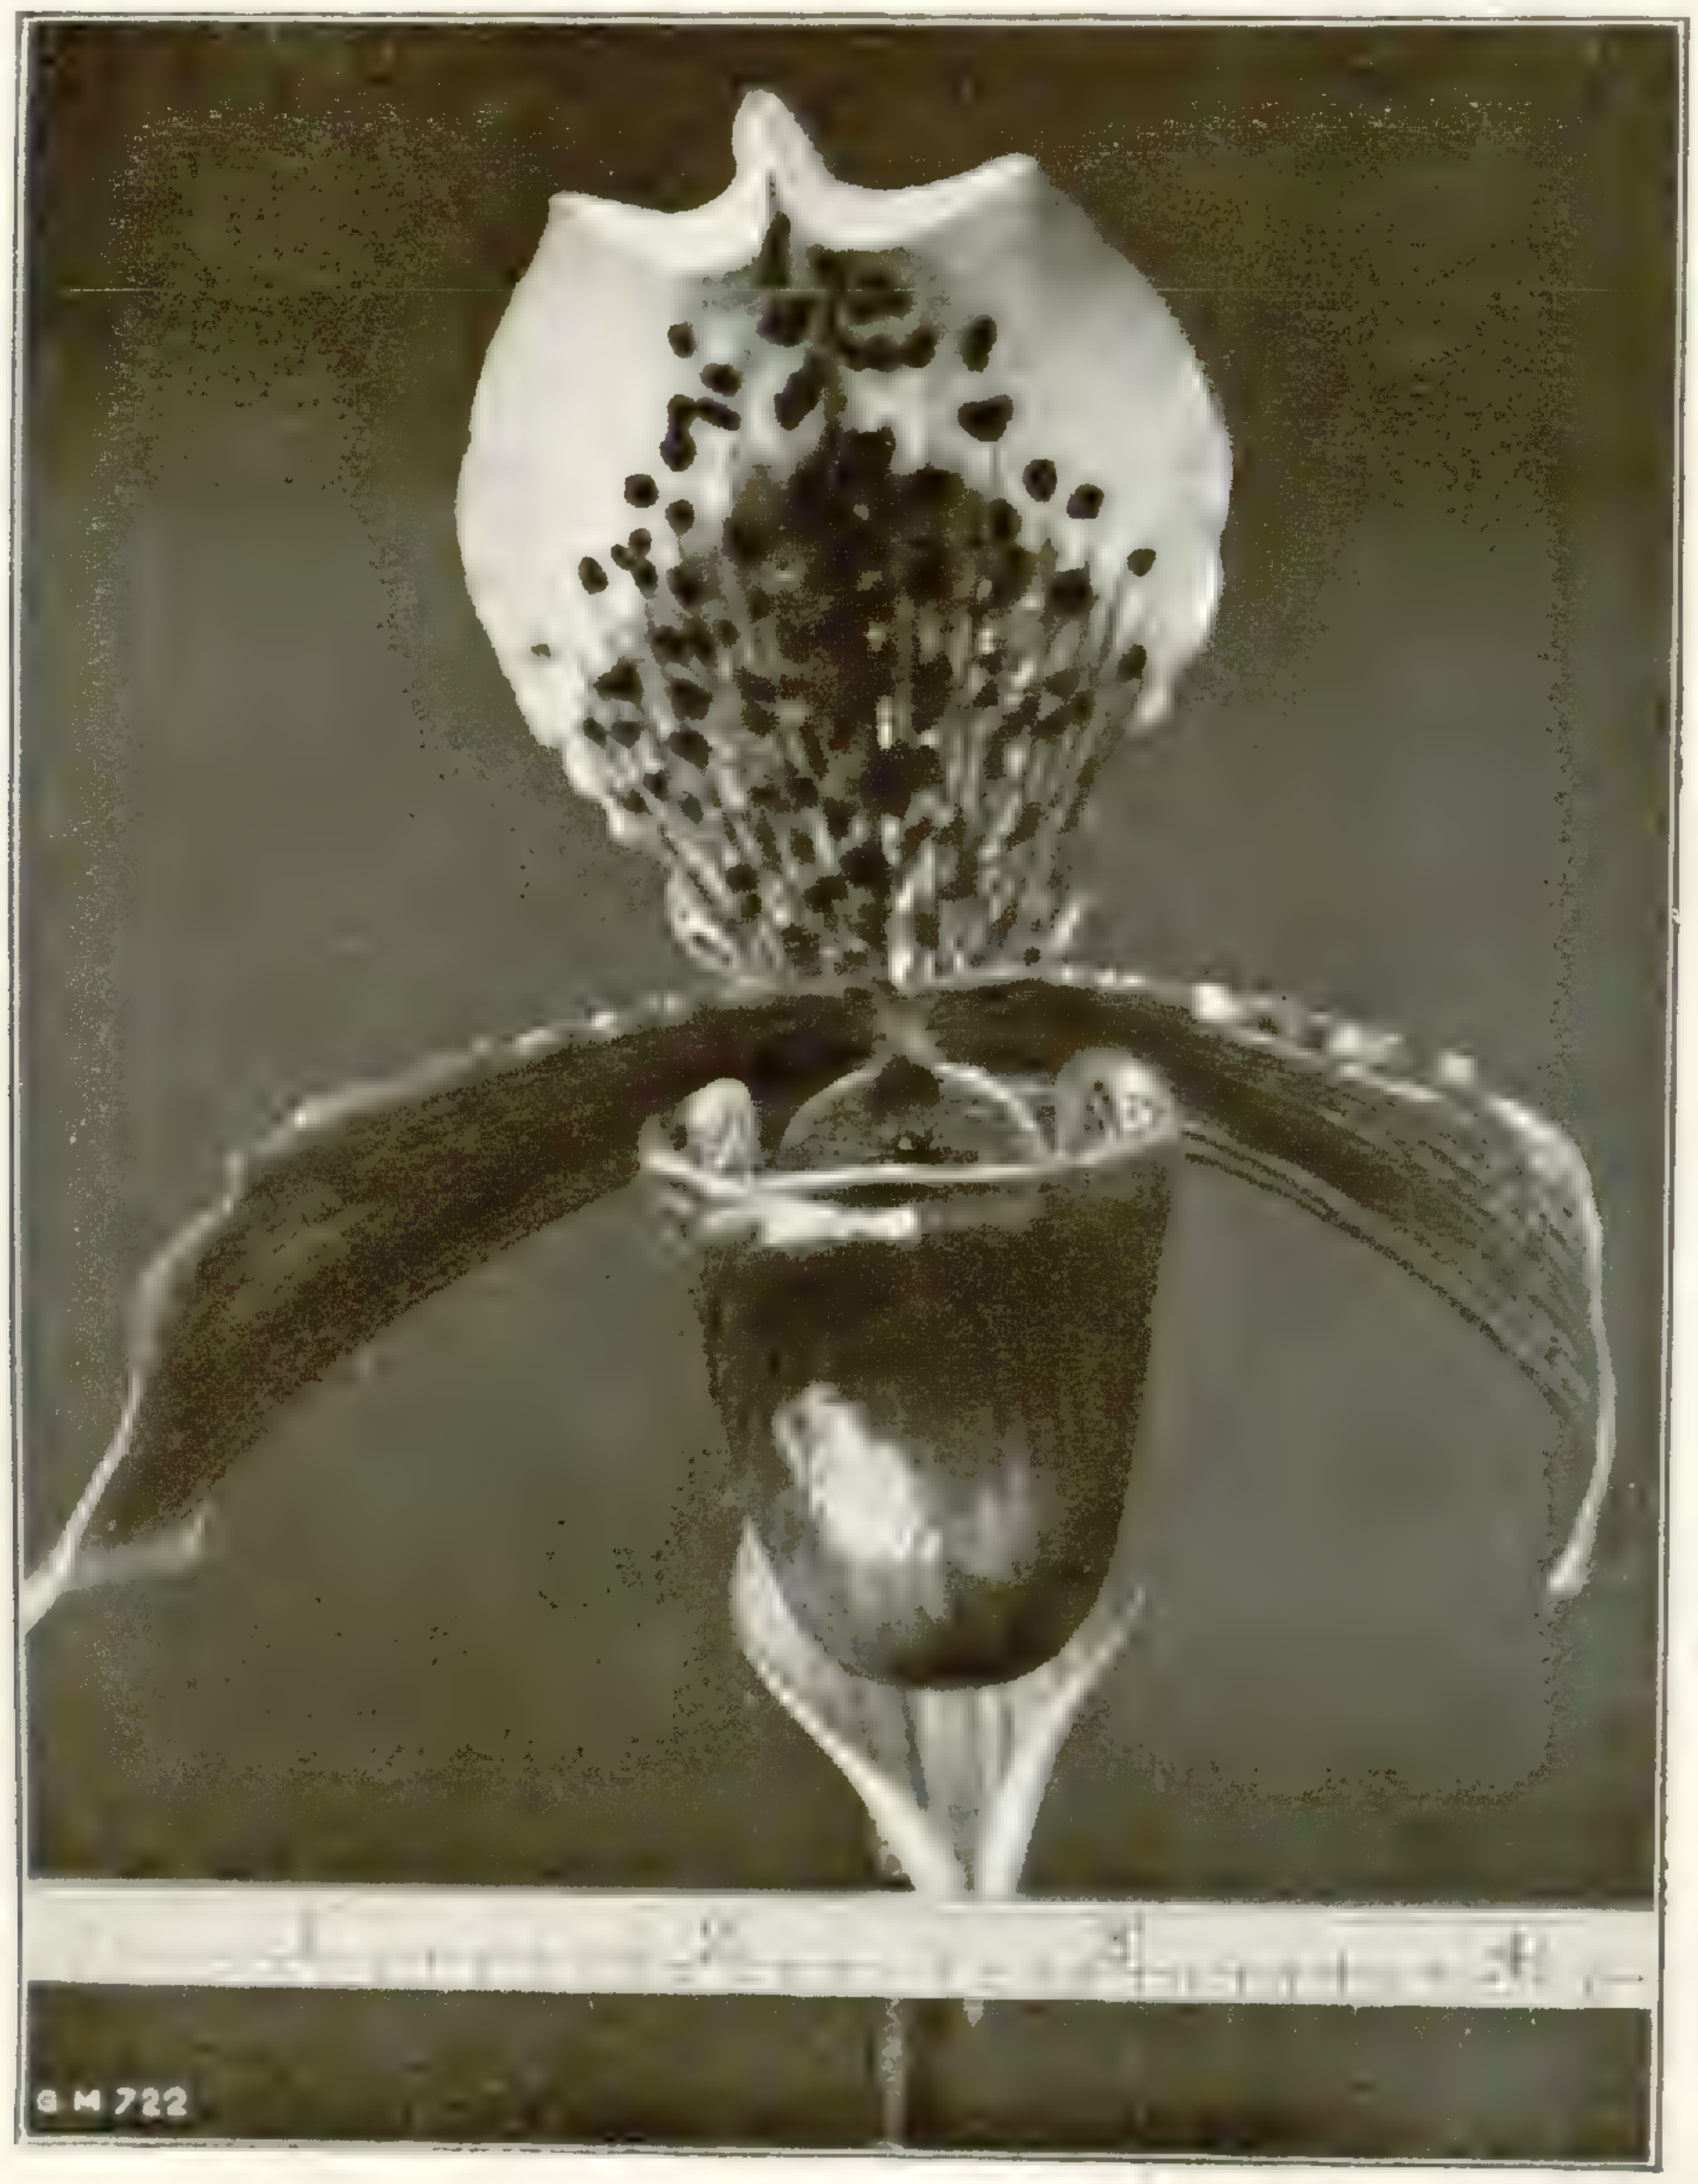
At one end, on a fairly high terrace, which is handsomely balustraded, and has a fine set of steps down to the greens, there is a big glass shelter, a handsome clock, a large aviary, and a small range of plant houses. The greens are almost surrounded by herbaceous borders, but along the terrace side summer bedding is made a great feature. Pelargoniums, early chrysanthemums, dahlias, fuchsias, abutilons, marguerites, and many other subjects are pressed into service for the embellishment of this long sloping border.

The bowling greens are sunk below the general level, and on the paths around there is an abundance of garden seats, from which the games may be watched in comfort. At right angles to the terrace, skirting the green, is a broad walk, grass bordered, and backed by hollies, with tall trees behind. Here, on the grass, are beds of pelargoniums, one variety in a bed; beds of succulent plants that appear to create a great deal of interest, and there are roses of various kinds, and in various forms. All this goes to show that a great deal of time and money are spent upon beautifying even the surroundings of this playground, and no doubt many who come merely for play, or to watch others play the ancient game of bowls, go away impressed by the beauty of the flowers, and with a desire to have flowers and plants in and around their own homes.

Armstrong Park.

Only a road divides Heaton Park from Armstrong Park, a park $52\frac{1}{2}$ acres in extent, that was presented to the city by Lord Armstrong, who made many princely gifts to Newcastle.

Here the ravine, that was scarcely obvious in Heaton Park, opens out so that the park becomes a beautiful deep dene, with hanging woods, and a stream running briskly along the bottom. Nearly all the trees, and they are many, are deciduous



CYPRIPEDIUM INSIGNE GRAND MONARCH.
Raised by Mr. Drewett O. Drewett, at Willow Wood.

hardwoods, such as oak and beech, but there is an abundance of rhododendrons to provide continuous greenery and beautiful flowers as well. A broad, well-kept, and altogether fine promenade road is carried along the top of the park, and paths turn off from it in many places, leading down the banks to the water below. Magnificent groups of rhododendrons and hollies, and pernettyas, and a collection of heaths, attract attention, while in the wider grass margins along the roadside there are beds of perennials and also of tender summer bedding plants. With the exception of these beds, and a few near either entrance, the park is left as natural as possible. Fortunately, the powers that be have seen the necessity of aiding Nature, and are keeping in view the fact that trees grow old, and old trees decay, and so new planting is being done here and there.

The introduction of groups of flowering trees and shrubs is an excellent feature, but there is a possibility of overdoing this in such a place, for Armstrong Park, like Jesmond Dene, owes its great charm entirely to its natural formation and sylvan beauty, and it is sincerely to be hoped that these will be maintained unimpaired for long generations to come. A word of caution may not be necessary to such canny people as those of Newcastle, but, having seen natural beauty spoiled by "improvements," I venture to make it. One suggestion I would make is that, as soon as possible, the hideous notices to "Keep off the grass" should be consigned to the scrap-iron heap, and be replaced, if necessary, by neater and less ugly ones.

Jesmond Dene.

Those who visit the great and wonderful centres of industry at Newcastle, and are duly impressed with the immensity of the business of this old Northumbrian capital, and yet fail to visit Jesmond Dene, lose a great deal of the interest that attaches to the city, and also the greater part of its beauty. I cannot hope to adequately convey to readers the exquisite natural and romantic beauty of this far-famed dene. In the course of many wanderings among the parks and gardens of many cities, counties, and countries, I have never seen anything like Jesmond Dene. It is the gift of the late Lord Armstrong, and an inheritance the city should be intensely proud of. The Corporation will, one hopes, always regard it as a part of their duty to the city to preserve the natural beauties of Jesmond Dene intact for all time.

From Armstrong Park the connection with Jesmond Dene is by means of a broad bridge that spans the intervening lane. The dene covers about 62 acres, and Mr. W. Wilson is the superintendent. Jesmond Dene cannot be viewed wholly from any one point, because it is long and winding, but this is a great advantage, as innumerable delightful views are presented as one proceeds to explore its charms. I wandered for a long time in the dene, up and down, back and forward, and at every turn new beauties appeared. The deep valley, with its continuous woodlands on the steep slopes, and its stream murmuring along their foot, amid a wealth of rhododendrons and hartstongue ferns, provides a natural garden that many a rich man would give thousands of pounds to possess, and but few, possessing it, would give away to their fellow men. The geography of Jesmond Dene I shall not attempt to describe. I remember a magnificent collection of hardy herbaceous plants near the upper roadway, great breadths of phloxes and violas, big groups of chrysanthemums, masses of dahlias, belts of rhododendrons, beautiful clusters of berberis, an extensive and interesting collection of heaths, a carpet of Gaultheria procumbens, and bold plantings of delphiniums. I remember a broad, sweeping road, with fine planes and maples, oaks and beeches, giving shade and shelter for those who desired to take advantage of the seats beneath. I remember the fine yews and

THE WATERFALL AND OLD BRIDGE IN JESMOND DENE, NEWCASTLE-ON-TYNE.

hollies, and the abundance of hardy ferns, the murmur of the breezes, the singing of birds, and the ripple of the water.

Lower down I crossed a small ivy-clad bridge over a stream, and, still further down, passed by the main stream, where the rhododendrons clothed the bank and dipped even into the water itself, and, by divers ways, came back to the outfall of the higher streamlet. Here is one of the most striking scenes in the dene. The stream comes down among natural rock boulders, and old tree stems and roots, the latter partly in the water and partly in the bank. Up above is an old mill, with the old water wheel still remaining, the whole forming a picture, in a setting of trees, that has been copied by artists and reproduced by photographers times without number. The water has been dammed back above the wheel, and falls swiftly and prettily over into the channel below, under the picturesque bridge.

A CHARMING WOODLAND WALK IN JESMOND DENE.

Other things that come back to mind are the new plantations of undergrowth in the woods, the young trees that are to carry on the succession of beauty, the patches of lily of the valley, of teazle, of willow herb, of Solomon's seal, and other common beautiful and suitable plants. I remember another garden of hardy perennials and annuals in a lower clearing, and the fragrance of the sweet peas. I remember it was all so beautiful on that fine autumn day that I stayed longer than I intended, and, with only just time to catch my train to the north, had to travel lunchless on to Berwick.

Charles H. Curtis.

EARLY CROPS OF PEAS.

Early peas are among the most highly esteemed of vegetable crops, and much pains are often taken in order to procure them as early as possible. Among the several modes of cultivation that are adopted to secure the desired end, some are better than others; but, owing to the want of available means, all cultivators cannot follow the most satisfactory practice, and each must consequently adopt that which is most suited to his conveniences.

In some cases houses or pits are provided in which to respectively grow and crop (from seeds sown in autumn and winter) either tall or dwarf kinds, as circumstances admit, for yielding very early supplies, but as the gardens in which this is carried out are comparatively few in number, and are likely to remain so, and are, moreover, usually under the supervision of the most skilful of gardeners, I will not dwell upon this description of treatment.

Nor do I think the kind of culture once in general use, though nowadays but seldom applied, viz., that of sowing first early crop outdoors in the autumn, necessary of explanation. Here, owing to the cold, and tenacious character of the soil, we have many difficulties that those placed under more favourable conditions do not have to meet; all the same, I do not recollect us having a crop fail until this spring, and it is owing to this failure, and the fact of others in this district meeting with similar disappointment, that I write these notes.

We sow seeds of Gradus, or some similarly good early variety, in five-inch pots in the middle of February, for the first crop, and place the pots in a newly-started peach house. Here the seeds readily germinate, and in a short space of time the plants are moved into an airy late peach house, and again subsequently into a sheltered position outside, where they remain until fit for planting out, which is done on a mild day upon a warm border, or some other sheltered position, when the soil is in a favourable state for the operation. Suitable trenches are made to receive the balls of soil, which are firmly embedded in specially prepared compost. Plants raised in this manner from seeds sown at the time named are ready for being planted out into permanent quarters quite as soon in the spring, as our soil is usually in a suitable condition for receiving them.

Successional early crops are treated in like manner to the first, and to follow these seeds are sown in narrow turves, about 15 inches long. The turves are grooved on the earthy side, and placed closely together in rows, with the grooves uppermost, upon a firm ash bed placed in a cool pit. The seeds are sown in the grooves, and covered with fine soil. As soon as the plants appear the pit is freely ventilated, and the lights, with a view to thoroughly harden the plants, are entirely removed for a week or so before the plants are put out. At planting time the turves are found to be well filled with the roots of the peas, and they are placed end to end in trenches, and prepared soil is firmly filled in around them.

Considerably earlier, and much better crops result from this way of dealing with early crops than can be secured by sowing the seeds in the borders, especially where the soil is cold and retentive, or when the spring weather is unfavourable, as has been the case this season, as proved by the failures I have alluded to. In our case, on February 20 we sowed our first peas outside, when the soil was in good working order, and selected William the First, on account of its hardy constitution, but even this variety could not withstand the intensely cold, and very wet weather that we experienced during March, for the seeds, with but few exceptions, perished in the ground.

T. Coomber.

The Hendre Gardens.

The Edelweiss.—My experience of this alpine is that seedling plants are not nearly so interesting as those obtained from a good stock, which originally may have been a seedling, but a good form. The ordinary seedlings I have raised and grown have been gaunt, with leaves too [illegible] and lacking that downy surface which makes the true edelweiss so beautiful. I am aware the plants are more liable to damp off, owing to the quantity of down they possess, but the point is to have more plants than one, as there is safety in numbers.

E. M.

Annuals.—The majority of these raised under glass will be much benefited if they are pricked off on a bed of fairly good soil and grown on in cold frames, and planted out permanently toward the end of the month. Another good sowing of seeds of asters, especially of the single varieties, should be made towards the end of the month. These will be found invaluable in the supplying cut flowers in succession to the earlier batches. Seeds sown in the [illegible] invariably allowed to remain too thickly, the result being they become [illegible] starved, and seldom attain to a high standard of perfection. Thin out after the [illegible] leaf is made, allowing reasonable distance, according to the strength of the plant, between each.—E. Beckett, Aldenham House Gardens.

COLOUR IN FLOWERS AND FRUITS.

It is well known that the shade of colour in both flowers and fruits varies in different localities, and, in some instances, to such an extent that it is sometimes difficult to recognise the variety. I grew Lychnis viscaria splendens plena on a rather light soil for a number of years, but could not induce it to produce the rich colour I found on those grown, to all appearance, on the same kind of formation in another neighbourhood. Some of my friends remarked that they must be different varieties, and in order to prove that they were the same I exchanged plants with the grower of the more richly coloured ones, with the result that my soil and treatment produced the pale-coloured flowers I had always obtained, and the soil of my neighbour converted my plant into one of a more decided hue of flower.

This was not merely an isolated case among the plants I then grew, for even geraniums, lobelias, and all out-of-door plants lacked the distinguishing colour of the varieties they represented in a more or less degree. This lack of colour was most marked in red and purple flowers. In the way of fruit my Worcester Pearmain apples only assumed a greenish-red colour, while that variety in the hands of the grower referred to was not only a rich dark red, but also had a polished appearance. Our treatment, in most instances, was identical, and, so far as the eye could tell, the soils were the same. I drew the attention of some eminent gardeners to these facts, and although all gave advice, yet when it was put to the test it proved valueless, so that I had almost despaired of arriving at a solution to the problem.

At this stage one of the professors of an agricultural college happened to call, and as we were looking at a plant of Lychnis dioica fl.-pl., which had washed-out flowers, I asked if he could explain the deficiency of colour. This he did by stating that potash was the chief element in organic colouring, and that my soil was evidently deficient in this alkali. He further explained that the chief constituent of the pigments just within the skin of the apple was potash, and owing to a scarcity of this all-important ingredient in the soil, I could not expect either richly coloured flowers or fruits. Pointing to some rhubarb, a little [illegible], this gentleman remarked, "That plant requires an exceptionally liberal supply of potash, and if you find it languishing under fairly generous treatment, you may safely conclude that it is unable to get sufficient potash to enable it to develop strong growth." I learned then, too, that sulphate of potash and kainit were the best sources of supply of potash, and that the sulphate could be applied at any time, but kainit should only be used in late autumn and early winter.

In order to test the correctness, or incorrectness, of those statements, I applied sulphate of potash to various plants which were growing side by side, of the same varieties. The amount of sulphate of potash employed was about 1½ ounces to the square yard of surface of ground, and the beneficial effect was apparent at the end of the summer in the healthier trees and larger and more highly coloured fruit. There was also evidence of the dressings of this sulphate when applied to bedding and other plants, convincing me that I had found the key to the cause of badly-coloured flowers and fruits, and inducing me to employ it and kainit much more extensively than I would otherwise have done. Of course, it means time, and several applications, before a soil poor in potash can be made rich in this plant food constituent, so that it took some years to work it up to the desirable point, and occasional dressing afterwards to maintain it at this standard.

If any other gardener has a difficulty in securing colour in his flowers or fruit, all other essentials being provided for, I would advise him to try the effect of a dressing of sulphate of potash at the rate stated, and note the result. As this takes time to become diffused in the soil, and to be taken up by the plants, the earlier in spring it is applied the better will be the result.

PEDESTRIAN.

EARLY-FLOWERING CHRYSANTHEMUMS IN POTS

Some of the early-flowering, or border chrysanthemums, which have in recent years become such favourites, make equally as good decorative objects in pots as the later-flowering varieties that need the protection of a greenhouse. One must put aside the idea of the specimen, or exhibition flower when growing the varieties of this section—and it is an artificial method of cultivation at best, and much too formal for many lovers of natural grace and beauty—and simply devote ourselves to the production of decorative plants covered with clusters of bright or sober-hued flowers. As pot flowers they possess one of the same recommendations as when cut, namely, that they keep their freshness longer in living rooms than almost any other flower, and that, not only in the full light of a window, but often in the more or less subdued light of the average entrance hall. I took special note last autumn of a twelve-inch pot of the well-known Horace Martin, which, brought indoors and set in a moderately-lighted hall when it was just getting into its full beauty, showed no signs of beginning to fail until after a fortnight, and after that was kept in fair condition for another ten days by cutting off a few of the earliest blossoms which were fading. I counted, roughly, 130 blossoms when it was at its best, and the whole plant, or group of plants, was clothed with vigorous green leaves right down to the base. People

[Photo: Charles Nicol.

THE OLD MILL AND MILL STREAM IN JESMOND DENE.

Hibbertia Readi.—Far and away the best known of the hibbertias is H. dentata, a delightful climbing plant for the greenhouse, in which structure it will keep up a succession of its golden blossoms throughout the winter months, and often well on into the spring. A second species—H. volubilis—is even a more vigorous climber, but it does not bloom so freely, and the yellow flowers have a most unpleasant odour. From these two species that at the head of this note—H. Readi—differs widely, as it naturally forms a dense twiggy little bush, which will flower freely when not more than a foot high. The leaves are small and narrow, and, like all the other members of the genus, the flowers are yellow. They are, in the case of H. Readi, about the size of a shilling. This hibbertia will succeed under much the same conditions as the eriostemons, chorozemas, and other Australian plants, but the climbing species enjoy more liberal treatment.—W. T.

coming into the house were surprised when told that the plant—for it appeared as only one—had been grown entirely out of doors

Anyone of experience will know that such displays are not obtained by chance, and yet they do not need a great deal of trouble beyond watering, and a little careful tying up and feeding. A poorly-grown chrysanthemum gives no satisfaction either in pots or in the open. Some advocate growing the plants in a nursery border, and taking them up and putting them in pots just before they come into flower. This system may be all very well for the production of cut flowers for market in the latter part of the season, but it does not yield the same results as are obtained when the plants are grown throughout in the pots in which they are bloomed, while the lower leaves generally lose their greenness on being lifted—the sure sign of indifferent culture. As one does not generally want many of these large pots for the decoration of the house, it is worth while taking a little extra trouble to have well-grown and handsome examples.

My plan is to split up some old stools in March or early April, and to put into sixties some nice young pieces bearing roots, and with no old wood attached, and these are then put in a frame. After a month, or perhaps less, they get a move into forty-eights—though this is not absolutely necessary—and then, about the middle or end of May, three plants are put together, in good soil, in a twelve-inch pot, or a size larger if the plants are very strong. When they are well established they are given liquid manure twice a week, and never allowed to flag for want of water, as this soon means the loss of all the leaves along the main stems. The growing points should be pinched out either once or twice during the summer, according to the height and earliness of the plants, and the time at which it is desired they should flower, the later the pinching the later the flowering. Careful tying up is all the further attention needed.

Disbudding for large blooms does not commend itself to most people for these early-flowering varieties, the result being alien to the freedom and grace we usually associate with them, but if a few of the smallest buds are removed so as to leave only three or four blooms in a cluster, the flowers will be finer without any appreciable diminution of the mass of blossom.

As to varieties, most will prefer those which do not generally come into flower before the middle of September, agreeing with the dictum of Mr. William Robinson, that "setting chrysanthemums much before their natural season is a practice of doubtful value in the flower garden." The Japanese type is more effective than the pompon, and the following suggested varieties are all of that type: Market White and Mychett White are still holding their own, the latter being of very bushy habit, but earlier, and the florets narrower than those of the former. Roi des Blancs is perhaps a better flower, but it is of taller habit, and I have not yet tried it for this purpose. For yellow there is still, in my opinion, none better for pot culture than Horace Martin, though the newer school will disagree with me. It needs more pinching though than some,and the flowers have a centre when fully open. Carrie is a paler yellow, but shorter in growth, and more compact. Champ d'Or is a fine yellow, and, I should think, would be good for the purpose. Goacher's Crimson stands alone among the reds, and is very dwarf, and of compact habit, though inclined to come into flower too early for some, reminding them of autumn in mid August. Still, if a long succession is wanted, it is invaluable. Of other darker colours Crimson Marie Masse and Robbie Burns mix well with the yellows, the latter variety being specially handsome by artificial light. Of course, one could name other varieties, but those recommended above will be found very satisfactory, and one does not want a collection for this purpose, one really good variety of any given colour being enough.

ALGER PETTS.

THE LESSER-KNOWN PENTSTEMONS.

In the GARDENERS' MAGAZINE of April 3 Mr. Smith contributes some interesting notes upon pentstemons, and, certainly, there are many species and varieties which are deserving of wider culture. In the matter of beauty they are not a whit behind the large-flowered florists' varieties, and many of them have a hardier constitution by far. Mr. Smith is certainly right when he advocates a well-drained position in the rock garden for pentstemon culture, and to my mind many of the charges brought against pentstemon species as to their inability to withstand much frost, would be more correctly made against damp, wet soil, as this is the most destructive enemy.

With regard to a sheltered position, I have but little faith in that, and would sooner trust the pentstemons in a fully-exposed position, provided they enjoy the maximum sunshine. In a well-drained soil, inclining to poorness, and open to the full effects of wind and sun, you obtain close, hard, fully-ripened growths, which are far better fitted to stand severe weather than plants grown in rich soil and sheltered positions, which would necessarily be softer in the growths, therefore succumbing far more readily to winter's severity.

With reference to Pentstemon heterophyllus, usually regarded as but half-hardy, I may say that a batch of bushy plants, placed out late in the autumn upon a new rock garden, and fully exposed to north and easterly gales, have justified the risk (if any) of late autumn planting, and have come through the winter without a loss. Add to this the fact that other Pentstemons have undergone the same test, and I believe the reader will admit they possess a fair degree of hardiness.

P. Newbury Gem has certainly been of great service for garden decoration, and its good habit and floriferous character are greatly in its favour. But good as Newbury Gem is, it is now outclassed by the newer Southgate Gem, a grand acquisition, which is a trifle taller in growth. The spikes and the individual blossoms are larger, the colour a more brilliant crimson-red, and the white throat more open and defined. For border planting it is superb, and a good future lies before it.

While writing of this group I must also note Myddleton Gem, a delightful rosy pink with a clear white throat. The colouring of this variety is exquisite, and with its light graceful habit and floriferous character, it forms a pleasing addition to plants for select groupings. As far as I can see this variety and Southgate Gem are by far the best of their class at present. The White Newbury Gem is a free-flowering plant, rather taller than the type, but it will not become really popular, as the colour is dull, being anything but a clear pure white.

There are several useful forms suitable for rock-garden purposes, which will prove hardy in the majority of gardens. For instance, the P. glaber group is hardy enough for any purpose. The type is of dwarf close habit, with dense heads of bluish-purple blossoms. The varieties alpinus, a soft bluish-white, cyananthus, a rich violet, and roseus, a deep rose-hued form, differ from the species only in their colouring.

P. pubescens, a rather pretty pale purplish species can be added to the list, and its varieties, pygmæus, a diminutive form, delightful for rock work, and latifolius, with broader foliage and lavender blossoms, are equally worthy of note.

P. cæruleus, which Mr. Smith notes, is truly a useful species, and others which might be utilised freely are the sulphur-coloured P. confertus, and its variety purpureus, a bluish-purple form. P. glaucus is an excellent dwarf with violet-purple blossoms, the miniature P. humilis, with lilac flowers shading to blue. P. Hallii, a splendid dwarf, has violet-mauve flowers. P. Menziesii is a useful sub-shrubby species with blossoms varying from violet to rose purple, and its varietal forms, Newberryi, rose pink, and Scouleri, a useful bluish purple, are valuable.

Enough have been mentioned to show that one is not limited in a choice of pentstemons, and as they are easy of culture and propagation, there is no reason why they should not be seen in the larger rock gardens in increasing numbers. When planting it should be borne in mind that bold groupings are most effective. Pentstemons are glorious en masse, and if they are delightful border plants they are even more charming in the rock garden, especially if grouped on a spot level with the eye. In such a position, with their masses of flower spikes crowding over the rock-face, one secures a fine picture.

P. S. HAYWARD.

BORECOLE CHOU DE RUSSIE.

A winter and spring kale which has made a rapid and popular advance by reason of its hardy constitution, distinct characteristics, and good flavour, is the Chou de Russie. In leaf characters it is suggestive of the Ragged Jack of former days. A review of a plot of these kales called forth a sympathetic remark from a gardening friend during the past winter, who thought, momentarily, there had been a pigeon raid. The lacinate leaves are very striking, and without close inspection may easily lead one to suspect birds have been at them.

Among the many stocks of kales there is a marked sameness of culinary flavour, the old Cottagers' perhaps standing out the more prominently for flavour superiority than others of the winter section. A trial of the Chou de Russie resulted in an immediate verdict as to its distinct flavour, and this, together with the peculiar leaf character, made it at once a recognised and enquired-for vegetable, both at home and in the market. While some kinds, even of the hardy Scotch Curled strains, succumbed to the winter's cold, the Chou de Russie came through the ordeal without much harm. There was the inevitable "scorch" which followed the frost and east winds, and was apparent on so many diverse subjects. But of absolute collapse there was but a very small percentage.

It will thus be clearly seen that three outstanding features of the Russian kale is hardiness of constitution, refined flavour, and distinct leaf characters, a combination which will no doubt lead to extended culture in the near future. These are merits which have been recognised by the R.H.S., and the award of a F.C.C. points to exceptional qualities in such an everyday vegetable.

W. STRUGNELL.

THE "BURBANK" BOOM.

Whatever the actual merits of Mr. Luther Burbank may be as a selective cultivator, the American Press, taking as an example the "Weekly Examiner," published in San Francisco (March 2 and previously) is rendering him supremely ridiculous by the claims it makes for him as a "Wizard" and a "Creator" of new plants.

Recently, in an article of two columns, it adverted to the wonderful Burbank potato, one of Burbank's earliest triumphs forty years ago, which, in one place, was claimed to be "the only potato grown in N. America from Alaska to Mexico, the year's produce running into millions of bushels, sufficient to pave a road right round the world," "a household word in the States," and so on, and yet in another place, this article claimed to be the very first announcement of its existence, which had been kept so secret that even in Santa Rosa (Burbank's home), no one knew of its existence. This was absurd enough, but now two more columns appear, booming the co-operation of two millionaires with Burbank to give the world the benefit of his creations. The first task of these capitalists is to deal with 30,000 unanswered letters, the accumulation of five years, the next is to deal with the potato, and the following "more marvels created":

"The Primus Berry, a union of the raspberry and blackberry, the first recorded instance of a new species, and the Phenomenal Berry, a combination of the California dewberry and the Cuthbert raspberry, a walnut bred with no tannin in its meat, gladioli of greatly enhanced beauty, taught to bloom around their entire stem like a hyacinth, instead of the old way, on one side; a dahlia with its disagreeable odour driven out, and in its place the odour of a marigold. A lily with the fragrance of a violet, and a scentless verbena, giving the intensified fragrance of the trailing arditus (?), fruit trees which will withstand freezing in the bud and flowers, an amaryllis bred from three or four inches to nearly a foot in diameter . . . improved varieties of thousands of grasses. Burbank has changed the chestnut in marked degree. Originally, it bore nuts in ten to twenty-five years. He has made it bear nuts in six months after planting the seed."

The article goes on to state that by crossing a common California black walnut and an English walnut, half a dozen trees resulting "were set out in the hard earth in front of the Burbank place, and in seventeen years these trees stood more than eighty feet in height, with a branch spread of seventy-five feet, and with trunks six feet thick at the height of a man's head."

Starving India is to be saved by the introduction of a cactus "which will grow in the most arid places, and make the most productable (?) stock and human food in the world." "A singular characteristic of this cactus is that it may be cut down and hung up in the air, and for two years afterwards it will produce a crop of fruit, with the only possible sustenance taken from the atmosphere." "Burbank has 150,000 varieties of plums, some trees being grafted to two or three hundred varieties."

The above represent but a portion of the statements made on Burbank's behalf, with which statements are interpolated numerous remarks imputed to him personally between quotation marks, as confirming all these and other marvels, which we venture to think any selective cultivator of standing on this side would hasten to disavow if only on the score of self-respect.

The humour and apparent sarcasm of the thing is enhanced by some accompanying verses, entitled "Tribute to Genius of Burbank the Wizard," in which a number of imaginary new combinations are alluded to, with three comic illustrations to fit.

C. T. Druery, V.M.H., F.L.S.

STOKES' ASTER.

Within the last few years the fine flower known as Stokesia cyanea has assumed greater importance in the eyes of the cultivator of hardy flowers, inasmuch as it has become recognised that there are really two varieties which flower at different seasons, thus satisfying those who have been unable to bloom Stokes' Aster, as they generally knew it, in the open. This variety of Stokesia has long been known, and has been rather largely cultivated in certain districts for the sake of securing its flowers for exhibition purposes at autumn shows. In most places it was found that the blooms were too late in expanding, and that in few seasons was it possible to have it in flower before the buds were pinched by early frosts, so that it was necessary to cultivate it finally under glass to induce it to open its handsome blossoms. Keen exhibitors of hardly flowers at shows in the north were therefore in the habit of cultivating the Stokesia in pots plunged in the open in summer, and taken into a greenhouse in July, so as to forward the flowers and induce them to open in August or September, as the case might be.

While this might serve the purpose of the exhibitor, it was profoundly unsatisfactory for the cultivator of hardy plants in the open, and the result was that the cultivation of Stokesia cyanea was gradually declining, save in the south, and our gardens were being deprived of the handsome flowers of this undoubtedly fine plant.

. Fortunately, however, an early-flowering variety, which has been called Stokesia cyanea præcox, has come to be known, and a fresh popularity has been achieved by Stokes' Aster, so-called because of its resemblance to the perennial asters or starworts. By securing it, the difficulty of having this flower in bloom, even in northern gardens, has been entirely overcome. It will flower in July in the south, and in August and early September in the north, so that it should rapidly make its way into gardens where it has not yet found a place.

Stokes' Aster is a handsome plant, growing about two feet high, the early variety being rather dwarfer, and giving its fine lavender-blue flowers, each about three or four inches across, in considerable numbers. Aster-like in form, they are fine for the border; for cutting for the house; or for exhibition purposes.

To do justice to this handsome plant it should have a good, but not too heavy soil, well manured with old cowhouse stable manure, and deeply dug, while the situation ought to be an open and sunny one. As a pot plant for the conservatory, the late-flowering variety is excellent, treated as are many late-flowering plants by growing it in pots plunged in ashes in the open during summer, taken indoors when about to flower (before danger from frosts appear), and bloomed in a light house. After the flowering is past, the pots may be placed in a cold frame until spring comes round, when they should be plunged in ashes in the open until required again. Plants are increased by division, but seeds may be obtained in the usual way.

In addition to the two lavender-blue varieties, there is a variety of S. cyanea præcox which has white flowers, and which is becoming appreciated by growers of hardy flowers.

S. A.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

MILTONIA VEXILLARIA.—Plants of this species will now be advancing their flower scapes, and at this period particular care will be found necessary, not only to keep insect pests in check, but also to afford every encouragement to enable the plants to develop and expand their blooms to the best advantage. Insect pests, such as thrips, greenfly, etc., can easily be kept in check by spraying at regular intervals, or fumigating with some safe vaporiser. Where plants have in previous years been infested with yellow thrips, it will generally be found that some will appear just when the flowers are being produced, and at such a time it is both difficult and dangerous to the flowers and buds to either dip, spray, or fumigate. It is therefore the more urgent that we should see that these pests are dealt with early, and take no risk with previously infested plants. Dipping is the safest method in such cases. The plants may be plunged in the insecticide to the base of the leaves, but every care must be taken to prevent the insecticide getting into the potting compost.

STAKING.—As the flower spikes advance they should be neatly staked in position, so that the flowers may expand uniformly, and in a position desirable to display them to the best advantage. There are no orchids more attractive or effective for exhibition or decoration than large specimens of M. vexillaria. Their cultural requirements I have so frequently dealt with in the past, and are so well known, that I need not further mention them. True, the flowers are not serviceable when cut as they fade quickly, but the plants, especially small ones, are exceedingly useful for conservatory decoration.

M. BLEUEANA.—I find this does best when grown under slightly warmer and more humid conditions than M. vexillaria. The plants produce more robust growths, and correspondingly larger and better developed flowers. Another point that is probably sometimes overlooked in growing M. Bleueana is that it should be treated as a perpetual grower, for almost before one growth has matured others are found starting from the base of the recently developed or developing growth. Although it is not advisable to give these too much encouragement in their early stages, they need support, and therefore the plants must not be placed under absolutely resting conditions, as in the case of M. vexillaria. I would also advise that any repotting necessary should be attended to as soon as the plants have passed out of flower. I find equal portions of fibrous peat, chopped sphagnum, and oak leaves, intermixed with sand and broken crocks a most suitable compost for M. Bleueana.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

AMARYLLIS.—Give these a light position in a warm house or pit after flowering, to encourage them to finish their growth. Any plants unsatisfactory at the roots had better be repotted. Pot fairly firm in a compost of two-thirds good fibrous loam and one-third composed of equal parts of leaf-mould and cow manure, with a small proportion of sand. Cover the bulbs about two-thirds of their depth, and when growth is finished gradually withhold water to give the bulbs a period of rest.

POINSETTIAS.—When grown in quantity these give a charming and brilliant effect during the winter months. From plants placed in heat early in April cuttings of the finest quality will now be secured, and in quantity, providing the plants have been given full exposure in a fairly well-ventilated structure. Some little difficulty is at times experienced in striking the cuttings, but when taken from sturdy, short-jointed, well-ripened plants, and from three to four inches long, with a heel of the old wood attached, the difficulty is overcome. Insert the cuttings singly in small pots to obviate check at repotting. When plants from eighteen inches to six feet in height are the object in view, propagation must be considerably extended by striking different batches. When the rooted cuttings are once established they should be given liberal treatment in a well-lighted and ventilated house or pit, keeping them near to the glass. A mixture of about four parts good loam and one part each of decayed stable manure, leaf-soil, and sand makes a good potting compost. Avoid over-watering and cold draughts.

GLORIOSAS. — After the winter's rest these ought now to be in active growth, and when they have attained sufficient strength a trellis will be necessary, and the last shift to be given should not be further delayed. Hoyas that have been resting will now need more water at the roots, and the old and new trusses will then soon send forth a crop of flowers, which, in the case of H. carnosa, will be followed by another later in the season.

SPECIMEN ALLAMANDAS. — While in rapid growth these may be shifted into larger pots, and, as it is most essential to produce an even break all over the plants, the shoots should be pinched. But should flowers be required at a certain date, sixteen weeks should be allowed from the last time of pinching or stopping the shoots, to have the plants in bloom. To grow and flower the allamandas successfully, give as little shade as possible; the foliage may not be quite such a dark-green, but short-jointed wood with greater substance will result from such treatment.

GENERAL REMARKS. — At this season when growth is rapid, disfigurement is soon caused by overcrowding, and nothing seems more favourable to the plants than a thorough rearrangement. When plants are grown in lean-to houses they are soon inclined to become one-sided, and to secure well-proportioned plants, space should not be limited.—W. Fyfe, Lockinge Park Gardens.

THE KITCHEN GARDEN.

PLANTING TOMATOES.—If things have gone well with these plants they will now be established in their pots and furnished with a truss or two of flowers nicely set, ready to swell away when placed in their final position. From now onwards whenever the weather is settled and the plants are sufficiently hardened off, planting may be carried out. Whenever possible, the sunniest wall should be given them. Train the plants erect, as cordons, at about eighteen inches apart, and pinch out all side growths to give full exposure to the flowers and fruits as they are formed. It is not desirable to plant in rich soil, but of an open, porous character; after a full set of fruit is secured, feeding and mulching may be liberally carried out with advantage. Allow the plants to settle down before nailing them to the walls.

EARTHING UP POTATOES.—The early-planted potatoes will be in full growth above ground, therefore do not delay in having the fork or hoe well worked amongst the crop and the soil drawn up to the stems. Damage is often done if this is left too long. Where the soil is not in good heart, and the plants require assistance, a sprinkling of an approved potato manure may be given between the rows; wood ashes are valuable to work in amongst the plants at this stage.

MUSHROOMS.—After this date the mushroom house will not be so satisfactory for producing crops, and better results will follow with outside beds. A good position is under the shelter of a north wall. Here an even, moist temperature can be maintained, which is of the utmost importance. The beds may be in a trench about 12in. deep, made thoroughly firm. This will give sufficient heat to run the spawn, and, by covering the bed with moist straw or grass, to produce a moist atmosphere, a steady yield may be expected. The ridge form of bed is also valuable at this season, but a less bulk of manure is necessary than with the usual autumn-made beds. From now onwards during the summer manure is liable to unduly dry during its preparation if much surface is exposed, therefore, it is better to place it in a closer bulk, and turn it frequently during its fermentation.

THINNING YOUNG CROPS.—Such crops as onions, carrots, early beet, turnips, etc., will require timely attention in the matter of thinning. This must be carried out according to the purpose they are grown for. If for exhibition, or any other special object, generous space must be allowed between each plant. For supplying a private establishment medium-sized produce is invariably the most serviceable, and economical. I do not advise in the case of onions, beet, or Shorthorn carrots, a too heavy hand with the thinning; at least, in the case of a large portion of these crops.

PLANTING OUT.—The ground, owing to repeated storms in some parts of the country, has not been in a fit condition for planting, and no purpose would be served in carrying it out in such a pasty state. Seize the first opportunity in the bringing up of arrears, and fix the plantations in quantity and time of maturing according to likely demands, to reduce waste of labour and valuable space to a minimum.

GENERAL REMARKS. — Seakale crowns will be commencing growth. As soon as the strongest shoot can be selected, remove the remainder, only reserving the one. A light dressing of salt at intervals will be helpful to give vigour to the plants. Pull up old broccoli stalks as soon as the heads are cut to avoid loss of valuable plant food. The ground will require a thorough dressing of manure before being cropped again. Keep weeds down before they reach the seeding state. An active hoe during a sunny day is a great factor in securing a clean kitchen garden.—Chas. Flack, Cholomondeley Castle Gardens.

FRUITS UNDER GLASS.

STRAWBERRIES.—These are an important crop now, because it is very desirable that when once strawberries have been sent to table they should be continued until those outside are ready. Be prepared to hold plants back in cold frames, introducing a sufficient quantity each week into houses or warm frames. Thin the blooms early to allow those remaining full opportunity for swelling. Keep the plants in full sunshine or the fruits will not be rich in colour or sweet. Keep the foliage well syringed twice daily in bright weather, and give liquid manure at every other watering until the fruits commence to colour.

PEACHES AND NECTARINES.—The early fruits have now nearly finished stoning; Hale's Early has already begun its last swelling, and as soon as this is seen the border should have a good sprinkling of guano or other fertiliser, and be thoroughly watered. Keep the foliage well syringed, and shut up early in the afternoon; prop the fruits up to the light with wood labels, as the fruits take on a much higher colour, and are well worth the extra trouble taken.

SUCCESSIONAL HOUSES.—Tie down the shoots as occasion requires, but no more wood should be tied in than is absolutely necessary. Every leaf should be given proper room for development. Thin the fruits before they are too large. If the late crops are coming on too rapidly admit air at the apex at night, with just a little heat in the pipes. Have the house well damped down several times daily, and when syringing damp every particle of wall, woodwork, and glass, so that red spider has no chance. Water with a system, that is, know how much water you are giving, and water the whole border; an inch of water is not too much when the trees are full of growth and carrying a good crop, and this about every fortnight at this season in warm houses. It must be remembered that peaches on an outside wall receive water, as rain, up to 25 or 30 inches, and very often good waterings in dry weather as well, which would amount to several inches more.

MELONS.—Fruits that are now reaching maturity should not receive much water, or they will be liable to crack just as they are ripening. The second batch should receive every encouragement by keeping the roots supplied with water, and as the roots appear on the surface add a little more loam and a sprinkling of fertiliser. Pollinate the blooms every day about 11.30 a.m., and as soon as a crop is secured remove the other flowers. Plants may now be prepared for frame culture, and wonderful crops can be grown in frames. Frames that have held bedding plants will make capital places for them if a little fresh manure is added, as a good temperature can easily be kept up. About five plants should be put out to a light 8ft. by 5ft., and by growing several varieties a succession can be secured.

EARLY VINERY.—If the berries have finished stoning the roots should be given a good dressing of manure, a mulch of strawy litter, and a thorough watering. Keep all laterals pinched to one eye at this period. Look over the bunches finally, and cut out any berries that may appear likely to overcrowd, and any stoneless berries, as these disfigure the bunch if allowed to remain. Keep a sharp look-out for red spider.

MUSCAT VINES IN FULL BLOOM.—These must be pollinated each day, especially if the weather is dull, but on a fine sunny afternoon a fine spray with the syringe distributes the pollen and effects a good set. In late houses the growths should be tied down gradually to the wires, and be treated similarly to Muscats at blooming time, though, as a rule, a good tap at midday is all that is necessary if the vines are in a healthy condition, with, perhaps, the exception of Lady Downe's Seedling and Mrs. Pince. See that the roots do not lack moisture, as the grapes will not set well if the roots are suffering from drought. Keep the house a little warmer while the vines are in bloom.—W. A. Cook, Leonardslee Gardens, Horsham.

Ceanothus Veitchianus.—This ceanothus is, as are most of the other members of the genus, a native of California, and, in common with many plants from that region, it cannot be regarded as perfectly hardy. Still, it forms in most districts a delightful wall shrub, and it is also valuable for flowering under glass in early spring, its one great merit being the bright hue of the blossoms, which are in colour so unlike any other hardy shrub employed for forcing. The flowers are borne in dense clusters on the ends of the short lateral branches. This ceanothus has for its immediate allies C. dentatus and C. papillosus; indeed, these species are sometimes confounded with each other. The leaves of C. Veitchianus are small, deep green, with a particularly glossy, almost varnished upper surface. It is one of the many good things whose introduction we owe to William Lobb during his travels in California about sixty years ago. When selections of shrubs are made for forcing purposes, this is undoubtedly entitled to a place among the best. —W. T.

Notes on Bulbous Plants.—Bulbous and tuberous plants, like lilium, eremurus, ostrowskia, etc., are now pushing up their shoots in the open border, and as these are readily injured at this season some protection in the form of light branches placed around the crowns will enable them to withstand spring frosts with impunity. Liliums of the stem-rooting section may with advantage be top-dressed at this season with rich soil, and a light mulching of decayed manure placed around the stems will assist in maintaining a uniform degree of moisture at the roots during periods of drought in the growing season. The various occupants of the bulb border should also be taken in hand at the present time; remove all winter protection, and break up and clean the surface soil, thereby admitting sun and air to the roots, an influence which soon makes itself felt among bulbous plants. Slugs are often destructive among bulbs in early spring, so that preventive measures taken now will have ample reward later, resulting in healthy specimens with perfectly developed foliage.—Thomas Smith.

SHREWSBURY GREAT FLORAL FETE,
AUGUST 18 and 19, 1909.

OVER £1,100 IN CASH PRIZES.

Schedules for this year are now ready, and may be had post free from—
Messrs. ADNITT and NAUNTON, Hon. Secs., Shrewsbury.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

National Auricula and Primula Society.

MIDLAND SECTION,

MAY 5 and 6.

Fortunately, the holding of the tenth annual show, owing to the lateness of the season, was postponed from April 28 and 29 to the above dates, for it proved the most successful event in the annals of the society, both as regards the number of exhibits and of visitors. Evidently also the cult of the classical old florists' flower is increasing in popularity in the Midlands from the fact that, with one exception, the competitors were confined to local growers, owing, probably, to the date not suiting the southern and northern growers. There was a keen competition in several of the classes, and many of the specimens were of very high merit, and the assemblage of the alpine varieties was unusually large, and the quality of the leading flowers superexcellent.

The most successful exhibitor, taking the show as a whole, was Mr. Charles Winn, Selly Hill, Birmingham, a keen enthusiast (gardener, Mr. T. T. Sheppard), and whose fine honorary exhibit of schizanthuses was much admired. A First Class Certificate was awarded.

SHOW AURICULAS.

The premier class for eight varieties included two exhibitors only, and Mr. W. M. Shipman, Altrincham, scored with excellent examples of Acme, Richard Headley, Mrs. Potts, Shirley Hibberd, Mikado, Abraham Barker, Eucharis, and the notable Harrison Weir. Mr. Charles Winn was a close second with Gladiator, Eucharis, Henry Wilson, Miss Barnett, Mikado, Harrison Weir, Lancashire Hero, and Perseverance. In the class for six varieties the position of the above-named winners was reversed, Mr. Winn having Olympus, Shirley Hibberd, Lancashire Hero, Harrison Weir, Henry Wilson, and Gerald. Mr. E. Danks, Handsworth, was third with Richard Headley, Mr. Henwood, Rev. F. D. Horner, Olympus, James Hannaford, and Rachel.

There were four competitors in the class for four plants, and Mr. Richard Holding, of Bournville, occupied the premier position with excellent examples of Acme, Cleopatra, Diamond, and Mikado. Mr. J. Collier, jun., Ludlow, second with Mrs. Potts, Shirley Hibberd, George Rudd, and Acme. The other winners were Mr. W. H. Parton (gardener, Mr. William Carpenter), F. H. Eglinton, and W. C. G. Ludford.

For two plants Mr. A. Wadley was first with Mrs. Potts and Shirley Hibberd; Mr. R. Holding second with George Rudd and Mrs. Phillips; and Mr. W. H. Parton third with Shirley Hibberd and Mrs. Potts. The other winners were, respectively, Messrs. Lawton and Eglinton. In the class for a single plant—green edge—Mr. H. Miller won with a fine example of Shirley Hibberd. Messrs. Shipman and Eglinton were respectively second and third.

For a grey edge Mr. Shipman was first with George Lightbody, Mr. C. Winn second with Richard Headley, and Mr. W. H. Parton third with R. Headley, and Mr. Shipman and Mr. T. Danks fourth and fifth with R. Headley and Olympus. For a white edge Mr. Shipman was first with Conservative and second with Acme; Mr. W. C. G. Ludford, Four Oaks, Sutton Coldfield, and Mr. C. Winn were third and fourth with Acme. For a self Mr. A. Lawton led with Mrs. Phillips, Mr. R. Holding second with Harrison Weir, and Messrs. Eglinton, C. Winn, and R. Holding third, fourth, and fifth respectively. For a self (yellow, primrose, orange, or buff) Mr. W. Shipman was to the fore with a beautiful example of Daffodil, Mr. C. Winn second with an exquisite Joan Peacock, and Messrs. E. Danks, C. Winn, and R. Holding third, fourth, and fifth with Buttercup—altogether a good quintuple of exhibits.

For two varieties (open to maiden exhibitors), Mr. George Savory, Rotton Park, Birmingham, was first with Argus and Duke of York; Mr. C. Reeves, Handsworth, second; and Mr. A. Egginton, Bearwood, third, with Firefly and Miss Baker. For three show auriculas (local growers' class) Mr. C. Winn was first with Gerald, Gladiator, and Marmion; Mr. E. Danks second with George Rudd, Ruby, and Shirley Hibberd; Mr. A. Lawton third with Gerald, Mrs. Phillips, and Shirley Hibberd. Messrs. Ludford and Eglinton were the remaining winners (nine competed). For three varieties by young amateur growers, Mr. H. W. Miller first, Mr. G. Savory second, Mr. J. Wadley third, and Messrs. F. J. Twist and A. Egginton, fourth and fifth.

ALPINE AURICULAS.

In the class for eight varieties there was a keen contest, and Mr. C. Winn won with fine examples of Mrs. Danks, Argus, Thetis (the latter a popular variety), Ettrick, Majestic, J. F. Kew, and Golden Acme, the other name not ascertained. Mr. W. H. Parton was a close second with Duke of York, Golden Acme, Thetis, Mr. M. Smith, Jack Parton (the latter a F.C.C. last year), Defiance, Mr. Gorton, W. H. Parton (F.C.C. last year); Mr. R. Holding third. Messrs. Eglinton, Shipman, and Danks followed on in the order in which their names appear. For six alpines Mr. C. Winn was again first, staging Ettric, Argus, Richard Dean, J. F. Kerr, Thetis, and Mrs. Danks in fine condition; Mr. T. M. Eglinton second with Argus, Teviotdale, J. F. Kew, Duke of York, Firefly, and Mr. M. Smith; the four remaining winners were Messrs. Shipman, R. Holding, E. Danks, and Ludford.

For four plants Mr. H. Lawton was first with Dean Hole, J. F. Kew, Argus, and Thetis; Mr. A. J. Wadley second with Dean Hole, Argus, J. F. Kew, and Thetis. The remaining prizes in the class were awarded to Messrs. C. Reeves, H. W. Miller, J. Collier, and W. G. Ellison, of Edgbaston. For two plants Mr. A. Lawton was first with Mrs. Danks and Thetis, Mr. Wadley second. Messrs. J. Collier, W. G. Ellison, and Tom J. Stevens were the other successful competitors.

For a single plant, gold centre, Mr. R. Holding won with a fine example of Majestic; Mr. C. Winn second with Dorothy Westmeath, and Messrs. Eglinton, W. H. Parton, C. Winn, and J. Collier completed the coterie of winners with good examples. For a light centre Mr. M. Shipman again led with Patience; Mr. C. Winn second with W. F. Kew, the other successful competitors being Messrs. Lawton, W. H. Parton, A. Wadley, and J. M. Eglinton. For a shaded or slightly shaded Mr. R. Holding scored with Unexpected, a grand acquisition; Mr. C. Winn second with a seedling (unnamed) of great breadth and large yellow centre; Messrs. Parton, Wadley, and Ludford staged promising seedlings, and Mr. R. Holding had George Cadbury.

For two plants (maiden growers) Mr. W. H. Edwards and Mr. A. Hughes, both of Handsworth, won with creditable examples. For three varieties (local growers) Mr. C. Winn led with Golden Acme, J. F. Kew, and Thetis; Mr. E. Danks second. Messrs. A. Lawton, Wadley, and Eglinton were the other winners. In the class for new growers, three varieties, Messrs. T. Stevens, G. Savory, Wadley, Twist, and Ellison were the successful competitors.

SEEDLING SHOW AURICULAS.

For two varieties, Mr. E. Danks was first with seedlings, Mr. Ludford second with David Copperfield and Charles Dickens, Mr. C. Winn third, Mr. R. Holding fourth, and Mr. A. J. Wadley fifth. For a single -green edged—Mr. C. Winn won with Charles Winn (premier), a grand acquisition; Mr. E. Danks second with Diana. For a grey edged Mr. W. C. G. Ludford scored with Barnaby Rudge, and second for an unnamed variety; Mr. Danks third with Mrs. Johnson. For a self, Mr. C. Winn won with a promising acquisition named W. Smith; Mr. R. Holding second with Optimist.

SEEDLING ALPINES.

For four varieties Mr. C. Winn again led with Edith Winn, Dorothy Westmeath, and two others; Mr. R. Holding second, and Mr. W. H. Parton and Mr. W. G. Ludford were the other winners. For two plants Messrs. J. Collier, Tom Stevens, and Wadley were prizewinners with unnamed varieties, and Mr. E. Danks with Tasso. For a gold centre Mr. C. Winn was first, staging Dorothy Westmeath; Mr. Ludford second with Great Expectation; Mr. C. Winn third, and Mr. Miller, fourth. For a light centre Mr. R. Holding scored with Salome, a variety of high merit; Mr. C. Winn second with Edith Winn; Mr. J. Collier third with a seedling from Mr. H. Turner; and Mr. Ludford fourth with Uriah Heep, both of promising merit.

POLYANTHUSES AND FANCY AURICULAS.

For six plants of polyanthuses or primroses, single or double, Mr. J. Collier led; Mr. A. W. Watts second, and Mr. Ludford third. For six pots of fancy auriculas Mr. C. Winn was awarded the first prize for interesting examples of Daffodil, Old Gold, May Queen, Butter and Eggs, Victoria, and Columbine.

Royal Gardeners' Orphan Fund.

The twenty-first annual festival dinner of this useful charity was held on Thursday, May 6, at the Hotel Cecil, Strand, W.C., under the presidency of the Duke of Rutland. There was a large and influential company present, that included Professor Keeble, Mr. N. N. Sherwood, Mr. Edward Sherwood, Mr. E. White, Mr. J. Collingridge, Mr. G. Bunyard, Mr. H. B. May, Mr. Jas. Douglas, Mr. W. Poupart, Mr. W. Howe, Mr. J. W. Moorman, Mr. W. Bates, Mr. W. Anderson, Mr. W. Baker, Mr. G. J. Ingram, Mr. G. Barr, Mr. W. H. Page, Mr. Rochford, Mr. Lane, Mr. T. W. Sanders, Mr. T. Bevan, Mr. W. Alderson, Mr. J. F. McLeod, Mr. J. Sweet, Mr. R. G. Cuthbert, Mr. D. Thomson, Mr. Wm. Thomson, Mr. Martin Rowan, Mr. E. Rochford, etc.

After dinner, and the acknowledgment of the loyal toasts, his Grace, who was very heartily received, on rising to propose the toast of the evening, "Success to the Gardeners' Orphan Fund," said he felt it a great honour to be permitted to propose the toast, but he felt he was not well qualified to deal with it. It was not every institution that in these times was financially sound, but the Orphan Fund was so. It was hardly possible the present year would be so good a one as the past, because the previous festival was a coming-of-age festival, and treated accordingly. But he hoped this year would not be much, if anything, behind the last. In the course of his remarks he told the story of the old lady who wore out the late Dean Hole's patience by asking absurd gardening questions, and who, on asking how the Dean served aphis on roses, was told that he washed them with cod-liver oil every day. He was not quite so ignorant as that old lady, but he felt in such a company of gardeners he had to be careful of what he said. He pointed out that every effort should be made to bring before the notice of all the aims and claims of the Orphan Fund, as nowadays there were so many charitable institutions, and, unless it was kept well before the public, the Orphan Fund would find it increasingly difficult to secure adequate funds. Gardening was not over profitable; it was a most interesting, and, to the community, a most useful occupation, and therefore its charities should be upheld; and he hoped that, whatever the future might hold, the Orphan Fund would not suffer. He thought market gardening just around big towns would soon have to be very gravely considered, as legislation might very seriously affect the trade, and its workers might suffer considerably if present political possibilities were to become facts. He hoped, however, that the public would not forget the Orphan Fund or cease to support it.

Mr. Edward Sherwood, the treasurer, in responding, thanked his Grace for presiding, and referred to the record year of 1908-9, during which the funds were largely increased, and now there were 214 orphans benefiting from the charity; but already there were fourteen applicants for the benefits of the fund at the next election, and to these the committee had granted each about 2s. 6d. per week while waiting for election. He urged the need of more annual subscribers, because the Fund had now greater liabilities than ever. He was glad to see a broader interest being taken in the Fund, and he wished to point out that the Fund was in no sense a metropolitan fund, but entirely a national one, hence the claim for help from individuals and gardening societies all over the country. The Fund was worked cheaply, and Mr. Wynne, the secretary, was now devoting his whole time to the service of the Fund. Management expenses were met now entirely out of dividends from invested funds, consequently all the sums received that evening would go directly to brighten the lives of gardeners' orphans.

The toast of "Gardeners and Gardening" was proposed by Mr. Edward White, who referred to the friendly relations between garden owners, professional gardeners, and the horticultural trade. He thought gardeners were scarcely alive to matters of special interest to them, and he suggested that horticulturists should assert themselves more in the councils of the country, and not allow gardening to be merely an appendix to agriculture. When times were bad gardening was one of the first things to be economised upon but he trusted the fund would not also suffer as a result of bad times. Dr. Keeble, in the unforeseen absence of Mr. Leonard Sutton, replied ably and humourously to the toast, and spoke of the delights of gardening as seen in all the gardens and parks at this season, as evidence of the art and skill of the gardener, an art also evidenced so markedly at the fortnightly meeting at the Royal Horticultural Society. He referred particularly to the skill and patience of gardeners, and to the wonderful creations in flowers, fruit, and vegetables they have given. He also honoured the gardeners who in so many cases have produced these things without any purely scientific knowledge; the scientist often followed a long way after in his knowledge of how the thing was done.

Mr. N. N. Sherwood, who was very heartily received, expressed the pleasure he felt at being again present at the festival, and regretted that ill-health had prevented his attending the dinners for six years. On a previous occasion his sons and himself had given his granddaughter, Maybud Campbell, a nomination to a grant to one orphan, and he now had a grandson, and he proposed to give him a similar nomination. This generous proposal was greeted with loud cheers. Proposing the "Health of the Visitors," Mr. Sherwood said he hoped the visitors had enjoyed themselves, and he trusted they would come again and generously support the charity. Mr. John Douglas ably replied, and greatly interested the audience with his many humorous stories.

The Secretary, Mr. B. Wynne, then read the subscription list, headed by the president with £10, and including £100 from Messrs. Hurst and Son. The total amount subscribed was about £800, the Covent Garden friends contributing £194 9s. 6d.

Mr. H. B. May, chairman of the committee, gracefully proposed "The Chairman," a toast that was very heartily received and duly acknowledged. Mr. Wm. Poupart proposed "The Press," and spoke of the admirable way in which the horticultural Press supported every good cause, and especially the gardening charities. Mr. John Collingridge responded.

An unusually good musical programme was carried out under the able direction of Mr. Turle Lee, the cornet solos by Master Lloyd Shakespeare being a fine feature of the musical items

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, May 4.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Sir Daniel Morris, K.C.M.G., Messrs. J. Fraser, J. W. Odell, H. J. Elwes, J. T. Bennett-Poë, A. Worsley, H. T. Güssow, G. Massee, J. Douglas, F. J. Baker, E. M. Holmes, W. Hales, H. Pearson, W. Cuthbertson, A. Rolfe, F. J. Chittenden (hon. secretary), and W. E. Ledger (visitor).

HYBRID NARCISSUS.—Mr. J. Douglas showed specimens of a hybrid narcissus obtained by crossing N. calathinus (which is not quite hardy) with the bicolor trumpet daffodil Weardale Perfection. The hybrid was a white trumpet daffodil with a somewhat short trumpet. It has proved hardy.

VARIATIONS IN PRIMROSES.—Mr. Douglas commented upon the considerable variations often seen in cultivated primroses in the comparative lengths of the style and the positions of the stamens, and showed specimens to illustrate his remarks. The extreme examples of departure from the normal conditions were seen in a flower in which the anthers and the stigma were both level at the base of the corolla tube, and in another where the style projected much beyond the mouth of the corolla tube.

HYBRID SALICES, ETC.—Mr. J. Fraser exhibited living and herbarium specimens of the following:

(1.) Salix fragilis x triandra (alopecuroides Zausch.) gynandrous specimens of the tree, which is normally male. Some of the smaller branches bore female catkins with a few stamens amongst them. The ovary is similar to that of S. fragilis, and the stigmas recall S. triandra. The posterior gland is often changed into one or two ovaries, separate or combined. The stamens are usually three, but in the female catkin there may be one, two, or three ovaries, and sometimes one stamen and one ovary (collateral).

(2.) Salix myrsinites x nigricans (punctata, Wahlb.).

(3.) Salix arbuscula x herbacea (simulatrix, F. B. White). Mr. Fraser also exhibited specimens showing sepalody of the petals in wallflower, and pistillody of the stamens in the same flower, and fasciation of the flower stem of Cardamine pratensis.

BRANCHING IN TULIPS.—Mr. Hooper Pearson showed branched stems of tulips of the Darwin form from a correspondent in France. There were usually four flowers, but sometimes as many as seven from a single bulb. The stems showed some degree of fasciation such as is frequently seen in these tulips. The exhibit was particularly interesting since it was stated that the branching character had become fixed, not only when the plants were reproduced vegetatively, but when they were multiplied by seed.

HYBRID ORCHIDS.—Mr. Rolfe showed flowers of Epidendrum evectum (purple) and E. xanthinum (yellow), and the hybrid raised by crossing them (= E. x kewense of a salmon colour). He also showed flowers of E. x kewense crossed with E. evectum, producing a hybrid having purple flowers (but not of the same shade as E. evectum), and of E. x kewense crossed with E. xanthinum, this cross bearing flowers resembling E. x kewense. When E. x kewense was self-pollinated it reproduced flowers of three sorts bearing great resemblance in colour to E. evectum, E. x kewense, and E. xanthinum respectively.

HYBRID CINERARIA.—From Me[illegible] Veitch, of Chelsea, came a hybrid between Senecio auriculatissimus and a form of the garden cineraria—the hybrid had yellowish white flowers.

VARIOUS PLANTS.—Mr. G. Paul [illegible] specimens of the two shrubs Plagios[illegible] sinense, an interesting plant belonging [illegible] the Rosaceæ, with flowers nearly ap[illegible]ing the Celastraceæ in structure, and [illegible]ing thorns a little distance above [illegible] the leaf axils in addition to the usual [illegible]lary bud, and Gleditschia Delavayi, a species from Yunan. Both of these had proved hardy at Cheshunt, but Mr. Hales stated that the latter had been killed by frost at Chiswick.

Mr. Worsley showed an inflorescence of Oncidium verrucosum var. Rogersi to [illegible]trate the great amount of variation in [illegible] lobing of the labellum seen in this [illegible]

Mr. Elwes exhibited a number of fine flowers of the recently-introduced Regelio-Oncocyclus hybrid irises raised by Mr. van Tubergen. He found that if kept dust dry for about five months they could be successfully grown in this country, and did not die out as the Oncocyclus irises usually do.

Bournemouth Gardeners.

On May 4 Mr. George Garner gave a lecture on "Vegetables for Large and Small Gardens" before a good attendance of members, Mr. Lansley presiding.

This lecture concluded the series of papers for the session, the next meeting being at the gardens of Mr. G. H. Rolls, J.P., Bournemouth, by this gentleman's special invitation, on June 1, at 6.30 p.m.

In addition to the annual outing of the members, a point is made of inspecting some local garden in the month of June each year, confining the visit to the evening time, and very pleasant and profitable, too, are these brief local excursions.

Mr. Garner did not attempt to deal exhaustively with the subject of his lecture on account of the impossibility of doing [illegible]tice to the whole subject in the time [illegible]posal, but gave useful hints on the [illegible]ment of the principal crops which [illegible] needed the close attention of the private [illegible]dener. The due preparation of the [illegible] deep digging, trenching, ridging, and [illegible]ing generally was referred to. Inte[illegible]ping was advised, as it was a good [illegible] in both large and small gardens. Rows [illegible] peas grown north and south, at 9ft. [illegible] with potatoes between, were, said Mr. [illegible]ner, far more remunerative than [illegible] grown close together. Lettuces [illegible] rows of celery always did well [illegible] the extra depth of soil there, and as [illegible] salad plants were soon ready [illegible] waste of valuable space occurred. [illegible] warning was given regarding the [illegible] of such crops as cabbages, cauliflowers, or winter greens between rows of peas or runner beans, as the former robbed the latter of much nourishment, the result being a loss to the grower.

Rotation cropping was another point strongly urged by the lecturer on account of the good effect it had upon the various crops so treated. Such kinds as peas, [illegible] runner, and broad beans, spinach, and [illegible]lar crops should not, said Mr. Garner, [illegible] grown on the same plots year after year, but be put in to follow root crops, [illegible] onions, parsnips, beet, and carrots. [illegible] generally proved very satisfactory [illegible] grown on ground previously occupied [illegible] celery; and winter greens did well [illegible]cession to early peas.

Manure, and its application, was also [illegible] with, the lecturer advising cultiva[illegible] apply it in the autumn in the case of [illegible] soils, and in the spring where [illegible] prevailed, but even in the latter [illegible] month prior to the cropping of the [illegible] possible. Autumn manuring was [illegible] recommended in the case of heavy [illegible] which potatoes were to be grown. A [illegible] selection of varieties of the different [illegible] of vegetables was given, and hints [illegible] treatment of the growing crops.

At the close of the lecture a free discussion took place, several members giving briefly their experience in growing vegetables in the prevailing light soils of the neighbourhood, and others asking questions, which were readily answered.

Votes of thanks to the lecturer and the chairman were heartily accorded, and ended a very enjoyable evening.

Croydon Gardeners' Association.

At its recent meeting this association was favoured with a lecture on "Hybridisation," by Mr. M. E. Mills, Coombe House Gardens, Croydon. The lecturer is one of those very active members of this society who gives his services generously to its welfare, and furthermore, offers his experiences to his fellow-members for them to profit by. Perhaps the finest achievement he has gained in hybridising is Begonia Lloydi, an exhibit of which gained him a silver cup at the Temple Show a few years ago, and this new race of such a popular flower is still being improved upon. In his introduction of his subject, he did not fail to mention the many setbacks one must expect before success attended our efforts, and the student must accept a seeming failure with good heart, for oftentimes in close study of this the remedy may be found and the goal reached.

Nature's methods of fertilisation are principally with wind and insects, and occasionally water helps in her work. Man in his artificial aid cannot do better than copy these methods, and proof of this is given us amply by the many additions he has made of late years. The study of botany is, of course, very essential to the would-be hybridist, for unless he is fully conversant with natural orders and structural organs of the plant he will probably court failure in his experiments. Fixity of type in a new hybrid must be well proved before offering it to the world, and vagaries of character of the parent plants were well described by reference to one of the world's greatest hybridists, Gregor Johann Mendel, in his experiments with the edible pea.

The hybridist must exercise forethought and be blessed with that virtue patience, surmounting difficulties as they appear and profiting by his failures.

A very hearty vote of thanks to Mr. Mills was proposed and adopted by his audience, to which he made suitable response.

Mr. W. Channon exhibited sevan dishes of apples in good condition, and the lecturer put up a nice collection of narcissi, which was much appreciated by the members attending.

During the past nine years this admirably managed and flourishing society has annually held an exhibition of spring flowers on lines wholly distinct from those usually followed, no prizes being offered or any charge made for admission. These gatherings have been remarkably successful throughout, for the members, with commendable public spirit, have liberally contributed of their best, and the residents in Croydon have shown their appreciation of the efforts of the society to provide them with an annual floral feast by attending in large numbers. This year the show was held in the Horniman Hall, and, as on previous occasions, the display produced was remarkable alike for its extent and beauty.

Both private growers and trade cultivators contributed collections of much interest to the exhibition. Mr. F. Oxtoby, gardener to J. J. Reed, Esq., Coombe Lodge, Croydon, exhibited stocks in a high state of development, which, in association with palms and ferns, produced a beautiful effect. Mr. W. Bentley, gardener to D. Nicol, Esq., Park Hill Road, Croydon, contributed a group of much merit, in which azaleas, crinums, schizanthuses, and palms were tastefully displayed. Schizanthus Wisetonensis was splendidly shown by Mr. M. E. Mills, gardener to Frank Lloyd, Esq., Coombe House, Croydon; calceolarias and primulas were contributed in fine condition by Mr. G. Sharp, gardener to Douglas Young, Esq., Strathallan, Croydon, and a superbly flowered azalea was staged by Mr. C. Thrower, gardener to Mrs. Matthew, of Anerley. Mr. A. Edwards, gardener to J. J. Pascall, Ambleside, Addiscombe, arranged a beautiful group of miscellaneous flowering plants; Mr. C. Wateridge, gardener to Otto Hehner, Esq., Woodside House, South Norwood, staged orchids and cinerarias; and Mr. J. Stringer, Hope Cottage, Summer Road, Croydon, contributed a collection of finely developed pansies.

Chief among the trade exhibitors were Messrs. J. Cheal and Sons, Crawley, who had a representative collection of flowering trees and shrubs, and hardy flowers; Mr. T. Butcher, George Street, Croydon, who contributed greenhouse plants in variety; Mr. J. R. Box, West Croydon, and Messrs. E. W. and S. Rogers, Croydon, who staged tulips in great variety. Mr. Harris, Croydon, who staged cut flowers, and Messrs. J. Peed and Son, who had alpines.

Mr. H. Boshier, the hon. secretary, and the members of committee may be heartily congratulated on the success that was achieved on this occasion.

THRIPS ON GARDEN PEAS.

The investigation of a disease of garden peas due to a thrips, which seems to be little known, was fully investigated by Mr. Cecil Warburton, zoologist of the Royal Agricultural Society last year. The results of his investigation are given in Mr. Warburton's annual report, which appears in the issue of the society's journal for the current year, and in view of their importance we herewith reproduce them:

During the past summer many cases of thrips on peas came under my observation. Most people seem to be unacquainted with the disease, and though I have found an occasional reference to it, and there is a Board of Agriculture leaflet on the subject, all the authoritative works on economic entomology are silent about it. Uzel, who has written a monograph on this group of insects—unfortunately in a little-known language, Bohemian—gives a list of plants on which the various species of thrips have been found, but the pea plant does not appear in the list. The German entomologist, Kirchner, is the only one I can find who even mentions it. I believe an article upon it by Westwood appeared many years ago, but I have failed to unearth it. The extent to which this serious pest has been overlooked is somewhat remarkable, for it is quite impossible that the injury it does can have escaped observation. No doubt the very small size of the insect has something to do with it, for it is difficult to credit it with the powers of destruction it really possesses. Probably the failure it causes has generally been put down to obscure weather influences, or in some cases to a fungus attack, especially as a fungoid disease is often found associated with it; but that it is really destructive in itself any member may very readily convince himself by the inspection of a few vegetable gardens next season, when once the nature of the attack has been pointed out.

Appearance of the Disease.

The disease is recognised by the blighted and distorted appearance of the developing pods, which, instead of being uniformly green and straight, are marked with white and straw-coloured blotches and curled to one side. Closer examination shows them to be infested by numbers of small yellow maggot-like creatures. There is no absolute destruction of tissue; if the leaves are perforated or eaten away, this is due to some other pest, but the general effect is a very unhealthy appearance.

To understand exactly what has happened, it is necessary to study the structure of the pea-flower and see how the pod arises. In the very centre of the flower will be found the ovary, or future pod, enveloped in a sheath, from which spring the stamens. Next comes the corolla of white petals, consisting of a large upper petal or "standard," two side petals or "wings" (with dark patches on them) and two lower petals fused together to form a "keel." Outside this is the little five-pointed green calyx. Very soon after fertilisation has taken place, the standard and the wings fall away, and the ovary begins to develop into the pod, generally carrying with it, as it grows, the keel, now detached from the flower base, so that a young pod, say an inch long, is still surrounded by the calyx and the remains of the stamen sheath at its fixed end, while its free end is capped by the detached keel. If diseased, the little yellow larvæ of the thrips will be found mostly concealed under the shelter thus afforded at either end of the pod, and from these hiding places the injury begins and gradually advances over the whole pod. Discoloured patches appear, interrupting the even greenness which characterises the clean and healthy pod. The patches, which are generally whitish, look very much as though the surface had been nibbled away. This is not the case, however, for if the outer skin of the pod be peeled off, it is found to be entire, even over the injured portions. The insects do not bite, though the contrary is sometimes stated. They pierce very minute holes in the skin and suck the sap, and the discolouration is due to the injury thus inflicted on the subjacent tissues. The discolouration is quickly followed by distortion, the pod losing its straightness and curling in a very unsightly manner. Fortunately, as the disease is on the outside of the pod, the seeds are the last to suffer, and quite tolerable peas can often be taken from very disagreeable-looking pods. For ordinary purposes, however, the appearance of the pods is almost as important as that of the peas themselves. Moreover, a stage is often reached where a fungoid disease aggravates the injury done by the thrips, and the whole pod becomes blackened and decayed. When this is the case with the older pods, it will be found that many of these at an earlier stage are killed outright and come to nothing, so that the whole yield may be very greatly reduced.

The Insects Concerned.

The minute insects known as thrips constitute an order by themselves, the thysanoptera. Haliday investigated the English species about seventy years ago, and no one in this country seems to have paid much attention to the group since, though some Continental entomologists have done excellent work upon it. It is quite possible that our ideas with regard to some of the English species require revision. According to Kirchner the species attacking the pea is Thrips cerealium. This ought, of course, to be a species attacking corn, and it has often been identified—probably quite correctly—as the cause of injury to wheat in this country. Uzel, however, states that he has never found it on corn in Bohemia, where the common corn thrips is T. secalina. About fifty British species have been described, all very small insects, less than a twelfth of an inch in length. Most of them are chiefly in evidence in hot-houses, but among outdoor crops three of them attack wheat, potatoes, and onions respectively. Some species are wingless; in others the females only possess wings, while both sexes of yet other species can fly. The wings are very characteristic; they are four in number, and are extremely narrow, and fringed by long hairs. The legs are short, and end in small bladders; indeed, the insect is known in Germany as the "bladder-foot." The metamorphosis is very slight, and the larvæ are much like the adults, except in colour and in the absence of wings. Some years ago there was a great deal of controversy as to whether these insects were really vegetable feeders at all, for apparently well authenticated instances were adduced of species feeding upon scale insects, and upon midge larvæ. It is now quite certain, however, that the carnivorous species, if any, are exceptional, and that most of them feed upon and often greatly injure plants.

(To be continued.)

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

CHRYSANTHEMUM CONFERENCE IN LONDON.—F. E. G., Haslemere: The National Chrysanthemum Society will hold a conference on early-flowering chrysanthemums at Essex Hall, Essex Street, Strand, W.C., on Wednesday, October 6, commencing at 3 p.m. The conference will be held in conjunction with the meeting of the Floral Committee on that date. It is proposed that four papers shall be read, two in the afternoon and two after the adjournment for tea. Mr. R. Witty, Swain's Lane, Highgate, is the secretary of the society, and could give you full information respecting membership, etc.

DISBUDDING PEACHES.—M. P., Weston-super-Mare: The main idea is to leave one shoot close to the base of every fruiting growth, as well as one at the tip. The latter is for the purpose of drawing sap along the growth for the supply of the fruit, and the basal shoot is to supply the fruiting wood for next season. After the crop has been gathered the fruiting shoots are cut away. This is the general method, but where there is ample room for extension and for laying other branches, then more shoots may be permitted to extend. The removal of a few shoots once or twice a week is good practice, as the trees do not then receive a severe check, as they certainly would do if the disbudding were done almost all at once. Remove all foreright shoots, and all that appear between wall and branch.

VIOLAS AND PANSIES.—B. T., Alnwick: We can heartily recommend "Pansies and Violets," a little work dealing with pansies, violas, and violets, written by Mr. D. B. Crane, and published at the GARDENERS' MAGAZINE office, price 1s. 2d. post free; or 1s. 8d. post free, in cloth covers.

HUMEA ELEGANS.—G. B., Leamington: Sow the seeds about the middle of July in pans containing a light mixture of loam and leaf-soil. Water the soil before sowing the seeds, then scatter the seeds thinly, and cover with sand, and place a sheet of glass over the pan. Stand the seed pan in a shady place in a greenhouse, and immediately the seedlings appear remove the covering and afford a light position near the glass. Great care is necessary to avoid overwatering at this period, because the seedlings will collapse wholesale if an excess of moisture is provided. Pot off the young plants singly into three-inch pots as soon as they are large enough to handle, and keep them close for a few days afterwards.

STRAWBERRIES.—D. V., Scarborough: Have the bed thoroughly cleared of weeds and the surface soil loosened with hoe or fork; then give the whole bed a good soaking with liquid farmyard manure, and at once lay down long strawy litter between the rows of plants, and press it closely around each plant also. See that posts and netting are ready for use so that the protecting material may be placed in position directly it is required. A better plan is to put the netting into position as soon as the watering and mulching are completed, because it affords some protection from weather as well as from birds.

DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of these popular flowers is "Dahlias and Their Cultivation," by J. B. Wroe, price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from THE GARDENERS' MAGAZINE Office, 148, Aldersgate Street, London.

SWEET PEAS.—L. S. B., York: The twelve varieties of sweet peas that headed the audit of the National Sweet Pea Society's show of 1908 were, in their order, according to the number of times shown, as follows: Helen Lewis, Countess Spencer, John Ingman, Dorothy Eckford, Helen Pierce, King Edward VII., Nora Unwin, Mrs. Collier, Black Knight, Gladys Unwin, Jeannie Gordon, and Paradise.

MOSSING LEGGY ANTHURIUMS.—W. R. S., Faringdon: Bind some fresh sphagnum moss firmly around the stem of the plant, close up to the lowest good leaves, and, if possible, allow a band of sphagnum broad enough to envelop any new roots that may have started from the upper part of the stem. Keep the moss moist always. In about three weeks' time cut a deep notch in the stem, all round, below the sphagnum, and as soon as the new roots have sufficiently advanced cut the stem through, pot the plant at once, and keep it in a close, moist place for a week or two before placing it with the general collection of stove plants.

FUNGUS ON ROSE STEMS.—J. S., Hayling Island: Please send us some more specimens of diseased stems as quickly as possible, addressing them to the Editor, Endsleigh, Priory Park, Kew, Surrey.

DODDER SEEDS.—L. S. P., Chertsey: The Board of Agriculture recommends that if a purchaser is not satisfied as to the purity of any seeds he may have purchased, an excellent plan is to sift clover and lucerne seeds, using a sieve of twenty meshes to the inch. Although the seeds of large American dodder are not removable in this manner, those of other dodders are separated with comparative ease. According to Nobbe's experiments, however, this method is not always entirely satisfactory, owing to variations in the size of the clover and dodder seeds. In the case of white clover, for instance, the seeds may approximate in size to those of dodder. To make a cheap serviceable sieve for the purpose a light wooden frame may be constructed about 12 inches square, and 3 inches deep, over the bottom of which a 20-mesh wire screen (made of No. 32 English gauge, round wire) should be tacked. In this one-fourth to one-half a pound of seed may be placed at a time, and vigorously shaken for half a minute. A man should be able to deal with from 5 to 10 bushels per day. It may be remarked that where much seed is to be dealt with a larger sieve would be more useful.

ORCHID COLLECTING.—T. M., Bradford: A fine constitution, plenty of pluck, and a good knowledge of orchids are necessary for a successful orchid collector. You should apply to Messrs. Sander and Sons, St. Albans; Messrs. Charlesworth and Co., Haywards Heath; Messrs. F. W. Moore and Co., Rawdon, Leeds; and Messrs. Hugh Low and Co., Enfield, Middlesex.

.. THE ..
TEMPLE SHOW,
LONDON,
May 25th, 26th, 27th.

A FULL ILLUSTRATED REPORT
.. OF THIS ..
Great Exhibition by the Royal Horticultural Society in the Gardens of the Inner Temple, will be given in the
Gardeners' Magazine,
May 29th and June 5th.

Price 2d. each Number, by post, 2½d.

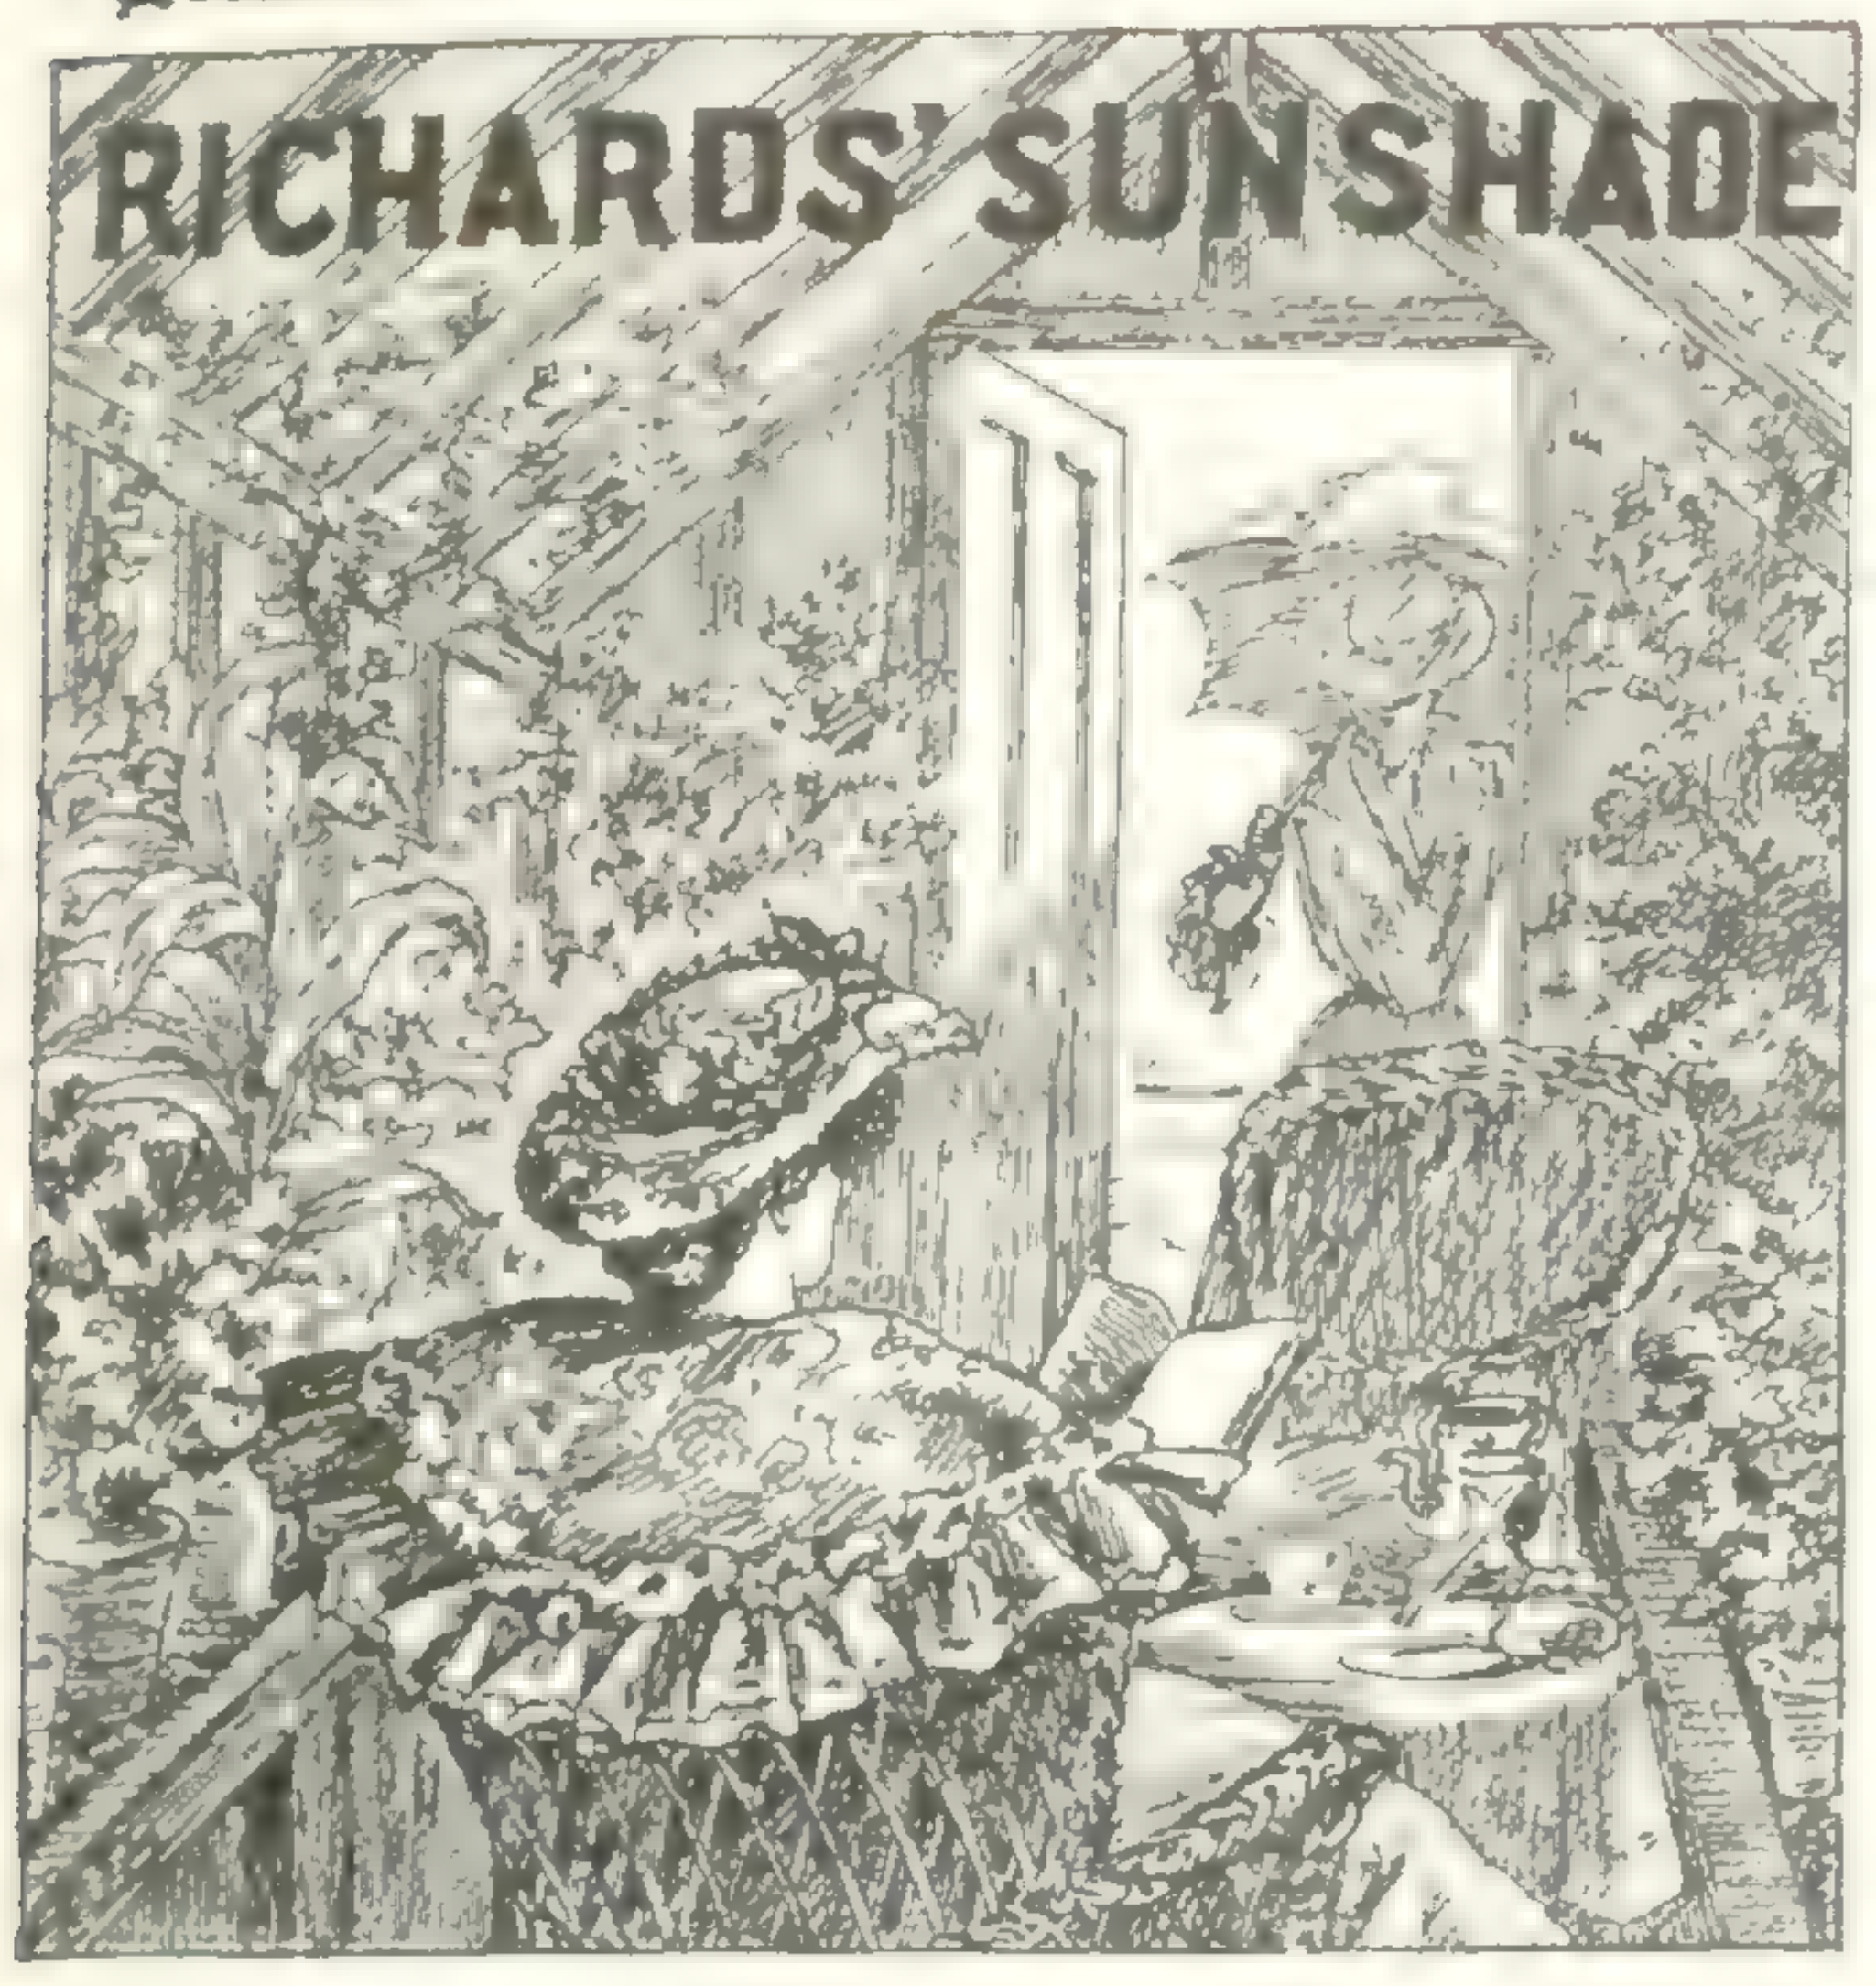
Gazania splendens.—This gazania will succeed where many other kinds of bedding-out plants would prove very unsatisfactory. The orange and black colours of the flowers are not found in any of the ordinary kinds of plants used for the filling of the flower beds in summer. I am always delighted to see this old favourite in a flower garden, as there is no other kind that can be used with the same effect. There are dry borders in most gardens, and also rockeries in exposed positions in many; the gazania is a grand subject for use in both positions. Large masses on a rockery look charming. It only needs a trial, and these plants are then sure to find additional favour in future years.—GEO. GARNER.

Disbudding Bougainvilleas.—The young shoots of bougainvilleas which are growing in a greenhouse temperature will now require disbudding. I have grown B. glabra in the same way as a vine for many years. In the autumn it is partially pruned, that is, the shoots are cut back to within 2ft. from their base. In February the remaining portion is cut hard back, and the plants well watered. In due course new shoots grow strongly, and are thinned out freely. The main rod is trained under the roof of a large greenhouse, and the branches allowed to hang loosely from the rods. The majority of the branches bloom, some being laden with flowers from 3ft. to 5ft. of their whole length. The flowering period lasts for five months.—G.

Do Not Allow Plants Under Glass

to be overdone and dried up by excessive sunshine. A 1/- packet will shade 100 square feet of glass.



R GD. TRADE MARK.

For Greenhouses, Conservatories, Garden Frames, and all other Glass structures which require shading. **"Sunshade"** is of a pleasing light green colour. It can be easily applied with an ordinary paint brush or with a garden syringe. Guaranteed to adhere firmly to the glass for the season. Rain will not wash it off; at the same time is easily removed with brush and water when necessary.

In 8 oz. Packets, 1/- each. 12 in a Box.

Single Packets or more can be purchased from any Nurseryman, Seedsman and Florist.

" " " " "6," 12/- " "
" " " " "8," 27/- " "

KELWAY and SON, Langport, Somerset.

GOLD OF THE GARDEN.
NOW IS THE TIME TO PLANT
Herbaceous Plants generally, but especially
KELWAY'S GOLDEN GAILLARDIAS.

Kelway's Gaillardias should be in every garden. The striking effect of their glorious golden and ruddy copper-coloured blooms cannot be obtained with any other plants. Insist on Kelway's, the most improved Gaillardias in the World.

Collection "B," 12/- per doz.
" "C," 18/- " "
Kelway's best named varieties.

KELWAY and SON, The Royal Horticulturists,
LANGPORT, SOMERSET.

Makers, POTTER BROS., Frankwell Netting and Waterproof Cover Works, Shrewsbury.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrips, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects, Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year. "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

Improved Metal
VAPOUR CONE FUMIGATOR,
At Greatly
Reduced Prices.

INTRODUCED 1885.

This well-known invention for the entire eradication of all pests infesting vegetation under glass is now manufactured in a more simple and reliable form. The small candle (which will be found packed with each Cone) has only to be lighted, and placed on the ground in the centre of the Cone Frame, to produce immediate results. Nothing in the market can equal it for efficacy and cheapness.

Cone No. 3, for a well-secured house of cubic 2,000 to 2,500 feet, 1/- each.
Cone No. 2, for a well-secured house of cubic 1,000 to 1,200 feet, 8d. each.
Cone No. 1, Carbon, for frames of cubic 100 feet, 6d.

Full Directions accompany each Cone.

Ask for a list of Testimonials, of which some hundreds have been received from the leading Gardeners in the Kingdom.

To be had from all Dealers in Horticultural Sundries throughout the Kingdom.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Pollen Grains.

Except in those cases where, as in many of the nut tribe, the conifers, and other genera, the pollen-bearing flowers are distinct from those which eventually bear the seed, and are even borne on separate plants, we shall find on examination of the blossoms borne by flowering plants, that pollen grains are present, usually in great numbers, and borne on stalks surrounding a central larger one, termed the stigma. On closer examination we shall also find that this stigma is really a projection from and continuation of the seed vessel below. In such cases as the poppies there is no stalk, and the stigma appears as a series of ridges on the cover of the seed vessel, which, however, involves no essential difference. To the naked eye the pollen appears merely as a powder loosely adherent to the tips of the stalks or stamens, but under the microscope this powder resolves itself into an immense number of very beautifully shaped bodies, both the form and colour of which vary greatly in different flowers, as does also the size. Thus, in the lily tribe we find them richly tinted with crimson or orange, and the individual grains are found to be of a long oval shape, pitted with small depressions, while in other flowers they may be spherical, bluntly triangular, or pyramidal, covered with pointed projections, or otherwise varied according to the species concerned, no two species being exactly alike. Their size varies roughly in agreement with the length of the stigma, so that in the lily or the evening primrose, where this is very long, we have the grains large, while they are correspondingly small in short styled plants. The reason of this is simple. The pollen grain is really a fertilising germ associated with a certain amount of material calculated to help that germ in its particular work of finding its way to the embryo seed at the base of the stigma, and by fertilising it enable it to perfect itself, and eventually reproduce a plant like the parent. Hence it is obvious that when such a grain reaches the stigma, whether blown to it by the wind or conveyed to it by insect agency is immaterial, it adheres to the viscid tip, and thereupon sets to work to protrude a slender tube within which is the fertilising germ aforesaid, and this tube penetrates between the cells of the stigma stalk at the expense of the nutriment provided by the rest of the pollen grain, and thus makes its way down to the incipient seeds contained in the seed vessel. Obviously a small pollen grain would be unfitted for a long journey, and become exhausted on the way, while equally obviously a large one is unnecessary when the journey is short, and hence the correlation in size mentioned. The number of pollen grains produced is very much larger than that of the embryo seeds, since in whatever manner they are enabled to effect fertilisation, the great majority are bound to be wasted, and, in the case of such plants as are fertilised by wind-borne pollen, the chance of a pollen grain reaching a stigma must be extremely small, millions to one against it. In some of the Canadian pine forests, indeed, the shores of adjacent lakes have been seen to be piled up with wind-borne pollen after breezes which have presumably blown in the wrong direction at the crucial time. None the less, Nature is so lavish in her provisions for reproduction that it is fairly safe to assert that every one of these grains, had it reached a stigma, would have proved its perfection by fulfilling those functions, though perfection means in all such cases the incorporation within the grain of such an infinitely complicated set of potencies as defies human comprehension. Since it appears to be a law of Nature that constant in-breeding weakens the race, there are innumerable contrivances in plants tending to hinder, rather than encourage, the fertilisation of a flower by its own pollen. Thus, in many cases, the stigma remains dry when the adjacent pollen is ripe for dispersion, so that none adheres, and the pollen is carried off by bee, moth, or other insect, to effect its office elsewhere. In the wind-borne pollen above described we see a further and most efficacious method of doing the same thing. Cross-fertilisation, however, is limited by Nature, as a rule, to the same species, insects mostly fly from plant to plant of the same kind, not visiting all sorts indiscriminately. The varying size of the pollen grains, and consequent capacity for tube formation, is another check, but probably the most effective is a sort of sympathetic relation between the viscid tip of the stigma and the proper pollen grains, so that, given a mixture of these with alien ones, the latter lack a stimulus which the former receive, and so a selection is effected. Here and there natural hybrids crop up, but, considering the wide dissemination of varied pollen.

MR. ALEXANDER KINGSMILL.

their occurrence is extremely rare. In conclusion, we would strongly recommend such of our readers as possess a microscope to devote a little leisure to the study of the wonderful pollen grains, whether of weed or floral pet, which they may find in every flower in the garden.

Mr. Alexander Kingsmill, whose portrait we have the pleasure of giving herewith, combines in a quite exceptional manner a strong affection for, and a thorough acquaintance with, the choicer kinds of hardy plants, and, as an authority on alpine and herbaceous subjects, deservedly ranks high among amateur cultivators of the first class. The gardens of The Holt, Mr. Kingsmill's charming residence at Harrow Weald, are wholly of his own planning, and while quite distinct in their main features from those of the conventional type, are free from eccentricities such as are sometimes in evidence when there is a deviation from the customary lines. The gardens are distinct and delightful, and in walking through them one meets with large numbers of beautiful plants that are not, otherwise than at rare intervals, met with in private gardens. This is due to the fact that Mr. Kingsmill not only loves hardy plants, but is well acquainted with large numbers that have not obtained the attention of the general body of cultivators, as well as of those that are in general cultivation. His thorough acquaintance with the immense number of plants that have found a home in his extensive gardens is certainly remarkable, for he is personally acquainted with every one, and can at once locate any particular kind, and give everything of interest that is associated with it. Mr. Kingsmill has for many years past devoted special attention to daffodils, and has raised several varieties of much merit, and has long been a member of the Royal Horticultural Society's Daffodil and Tulip Committee. More recently he has become a member of the Floral Committee, where his thorough acquaintance with hardy plants, trees, and shrubs will be of much value. We would add that we had the pleasure of giving an illustrated account of The Holt gardens in the issue for August 22, 1908.

The Great Temple Show, to be held in the Inner Temple Gardens, London, on May 25, 26, and 27, promises to be one of the finest on record. Our readers will be glad to learn that preparations are already well advanced, and the entries indicate that excellent exhibits of orchids, carnations, roses, alpine and rock plants will be staged. We shall, as usual, give a full and illustrated report of this great gathering in our next issue, and shall describe and illustrate the new plants, flowers, etc., in the issue for June 5.

Dean Hole Medal.—On the death of Dean Hole, who had for so long a period been the president of the National Rose Society, the members of the committee, to perpetuate his memory, set themselves the task of raising a sum of money for the purpose of founding a medal, to be known as the Dean Hole Medal. It was decided that the amount raised should be invested, and that with the income derivable therefrom, medals should from time to time be presented to those who have rendered substantial service in the cause of the rose. A sufficient sum having accumulated to admit of the first medal being struck, the selection of the recipient has engaged the attention of the executive for some time past, and at the meeting of the General Committee, held on Tuesday last, the medal was, by unanimous vote, awarded to the Rev. J. H. Pemberton, in recognition of the merits of his important work entitled "Roses: their History, Development, and Cultivation," which was published by Messrs. Longmans, Green, and Co., last year. We congratulate our much-valued contributor on the honour thus conferred upon him, and the committee on the judgment shown in the discharge of a task by no means free from difficulty.

A Forestry Exhibition will be held at Gloucester in conjunction with the Royal Agricultural Society's show, which will be held from June 22 to 26. This exhibition will be on similar lines to those previously held in the "Royal" showyard. There will also be a competition for prizes for plantations in the counties of Gloucester, Hereford, Wilts, and Worcester.

Portrait of Mr. Harry J. Veitch, V.M.H., F.L.S., etc.—Amid the increasing love of plants and gardens it may possibly be forgotten to what a really vast extent the present and succeeding generations are indebted to Mr. Harry J. Veitch, V.M.H., not only for his invaluable work amongst plants, but also for the assistance he has invariably rendered, personal as well as financial, to the great gardening charities. A few of his friends and admirers (both amateur and professional) are therefore desirous of having his portrait painted by one of our leading artists, in order that it may be hung permanently in the buildings of the Royal Horticultural Society. A sum of six hundred guineas will be required. Of this a very substantial sum has already been received, but it is thought that, amongst many of his friends, there will exist a feeling that an opportunity to subscribe should also be afforded them. It is proposed, should the funds admit, to present each subscriber of one guinea and upwards with an engraving of the portrait. Subscriptions may be sent to either Mr. H. B. May, of Stanmore, The Green, Chingford, or to the Rev. W. Wilks, Shirley Vicarage, Croydon.

A New Gooseberry Mildew Order.—A new order make by the Board of Agriculture and Fisheries with respect to American gooseberry mildew in Great Britain has been issued. The occupier of any premises on which there is a gooseberry or currant bush which appears to be affected with the disease is required to give notice of the fact either to the Board or to the local authority, and precautions are prescribed for adoption in the case of an outbreak. The local authority is directed how to proceed upon receiving notification of cases of the disease, and is empowered under the Destructive Insects and Pests Acts to require certain measures to be taken by the occupier concerned. The landing in Great Britain of any bush brought from any place outside Great Britain (excepting the Channel Islands) is prohibited, with the exception of any currant bush for the landing of which the licence of the Board has been given. Every person who commits any offence under the Acts is liable on conviction to a penalty not exceeding £10. The earlier Orders made under the Acts are revoked.

New Playing Ground for London.—To-day (Saturday) the Prince of Wales will open a playing ground of thirty acres at Fairlop, near Ilford. Two years since several fields then used as arable land were purchased by Mr. E. N. Buxton, on behalf of the London Playing Fields Society. The site was that of the famous Fairlop Oak, around which for many years an annual fair was held. The several fields were thrown into one, the land was levelled and sown with suitable grasses, and the turf is now in a condition that will admit of the various summer games being played without material injury to it. The cost of the purchase of the land and bringing it into its present condition has been £4,500, of which a considerable proportion was generously contributed by the City companies.

British Gardeners' Association.—The annual general meeting of the British Gardeners' Association will be held in the Essex Hall, Essex Street, Strand, London, on Wednesday next May 26, at [illegible] p.m., to receive the annual report of the Executive Council, and to transact other business. Mr. J. Weathers asks us to remind members that they must show their red membership cards for 1909 when entering the meeting. Mr. E. F. Hawes, chairman of the Executive Council, will preside.

Proposed National Vegetable Society.—The attention of all who are in any way interested in the cultivation of vegetables is drawn to a meeting which will be held in the Essex Hall, Strand, London, W.C., on Tuesday, May 25 (first day of the Temple Show), at 4 p.m., for the purpose of forming a National Vegetable Society. Mr. Alex. Dean, V.M.H., will preside, supported by Mr. Owen Thomas, V.M.H., Mr. Charles Foster, Mr. G. Wythes, Mr. W. Poupart, Mr. G. Hobday, Mr. H. Markham, and others. It is hoped that all gardeners and members of the trade will attend and give this movement their heartiest support.

National Rose Society.—The "Arrangements for 1909," in which are included the list of members, schedules of prizes, and the bye-laws and regulations, forms a substantial publication, and indicates in a conclusive manner the remarkable expansion of the society of late years. The amplification of the schedules of the exhibitions at Regent's Park and Luton, on July 2 and 14 respectively, has helped to increase the size of the "Arrangements," but the increase in the bulk is mainly due to the extension of the list of members.

Flower Shows at Birmingham.—The Birmingham Botanical and Horticultural Society have decided to continue this season the practice of holding two summer flower shows at the Botanical Gardens, Edgbaston, during the summer months. The forthcoming shows will be held on June 9 (orchids and early summer flowers) and July 21 (roses and midsummer flowers). Honorary exhibits are invited. Schedules may be obtained from the hon. secretaries, Messrs. Humphreys and Whitelock.

Small Holdings.—In giving particulars in the House of Commons respecting the working of the Small Holdings Act during the sixteen months that Act has been in operation, Sir Edward Stracey stated that during the sixteen months 30,250 acres had been acquired voluntarily, or had been included in schemes submitted. The quantity actually in possession of County Councils was 11,345 acres, which had been acquired at a cost of £370,9[illegible]5, and the acreage leased by County Councils was 10,[illegible] acres. The total value of the land purchased and leased was about £[illegible]. Compulsory orders had been applied for the acquisition of 4,170 acres of land, and the total number of applicants was 23,2[illegible]5, of whom 13,203 were approved, and of the approved applicants 34 per cent. were agricultural labourers. The number of applicants provided for was 2,200, though they were not all in actual possession. The land required by approved applicants extended over 373 600 acres.

Soil Inoculation.—The annual report on the experiments conducted at the Harper-Adams Agricultural College, Newport, Shropshire, are invariably of much interest, and that dealing with the experimental work of 1908 is especially so. At the college, as elsewhere, nitrogen fixing organisms received attention, and trials of nitro-bacterine in conjunction with another culture sent by Dr. Hutchinson, were made. Nitro-bacterine was used in the cultivation of broad beans, red clover, culinary and sweet peas, white clover, scarlet runners, sainfoin, and tomatoes, and Dr. Hutchinson's culture for broad beans and red clover. The trials were carried out in two sets, one in the open ground and the other in boxes of steamed soil. In both sets of trials the seed was dressed, and the plants subsequently watered with more of the prepared dressing in accordance with the instructions issued. There were, of course, control plots and boxes. Briefly stated, the results obtained in the open ground plots were as follows: Red clover (Dr. Hutchinson's culture), "no difference between the plots; many plants flowered and seeded, both strong"; (nitro-bacterine), "growth strong, more plants flowered and seeded in undressed plot than in dressed plot." Broad beans (Dr. Hutchinson's culture and nitro-bacterine), "no difference between the plots." Culinary peas (nitro-bacterine), these were grown in rows 45 feet long and from the dressed row 50lbs. of peas were gathered, and from the undressed row 46lb. Sweet peas, white clover, sainfoin, and tomatoes (nitro-bacterine), "no difference between dressed and undressed plots." Runner beans (nitro-bacterine), "there was a considerable difference between these plots all through the season, the rate of growth being greater on the dressed plot, and flowering commenced much earlier." With reference to the experiment, it is stated in the report that "the results obtained from both the open ground and box trials indicate that on a barren soil the use of the cultures may be attended with some degree of success; but that on ordinary soil, even if it is not in a high state of cultivation, there is little benefit to be derived from the use of either preparation."

Flora of Ngamiland.—The latest issue of the "Kew Bulletin" is largely occupied with a consideration of the flora of Ngamiland, the most remote province of the Bechuanaland Protectorate. There is a capital and very interesting introduction by Major Lugard, who, with his wife, [illegible] F. Lugard, collected the plants enumerated and described by Mr. A. E. [illegible], of the Kew Herbarium. The collection contains 320 dicotyledons, 52 monocotyledons, and two ferns, a total of 374 species, of which 92 are new. The general level of the region in which they were collected is 3,000 feet above sea-level, with hills rising a few hundred feet higher, since the highest elevation recorded on any of the labels is 3,600 feet. The specimens are all well selected, carefully preserved, and mostly very complete, and accompanied by valuable notes on the habit, colour of flowers, etc. Mrs. Lugard also made a large series of very accurate coloured drawings, with dissections, from which much aid has been obtained in preparing the following descriptions. The general composition of the flora of the region appears to be somewhat as follows: Trees about [illegible], varying from 15 to 40 feet in height; shrubs or bushes, 44 or over; succulent plants, about 15; annuals, 58; thorny or prickly plants, 17; climbing or twining plants, about 30, besides many that scramble over bushes or rocks, or creep on the ground; bulbs, 20; and of orchids only two were found. The remainder are mostly herbaceous perennials or shrublets. Most of the specimens flower during the rainy season, i.e., December to February. Yellow is the predominating colour of the flowers, next in order come white, green, mauve, purple, cream, orange, pink, red, blue, greenish or greenish-white, magenta, claret, and scarlet.

A GARDEN TO LIVE IN.

Lovers of the open air become more numerous day by day, and the serene, healthful influences of outdoor life are constantly obtaining more recognition; therefore, it is that the garden is of infinitely greater importance now, and will continue to attain more consequence, than in the old times when our ancestors valued it solely as a frame to the dwelling, a nursery of flowers for the home, or merely a fair weather resort.

To find out how to make the garden a comfortable living room is a study that claims early attention; it is, naturally, in large grounds that most can be done, but a small plot proves almost as convenient if provided with a round shelter with sliding shutters. This kind of summer pavilion does not cost much to build, or can be bought ready for fixing, either with or without a roof. Set in the open, away from trees, it necessarily is a room with all aspects at choice; the southern warmth, or northerly coolness, the vision of eastern or western skies, can be gained at will.

A long-shaped small garden, running north to south, is fairly well provided with living-rooms if it has a shelter at each end; sometimes there is a blank space of the house wall that can be used for the back of a hut, then only the sides, far apart, and a slanting roof, are needed, with a pillar or two to uphold the latter and give ornament. This outdoor room of the house can be so manufactured of rustic wood and red tiles, so climber-covered, that it is quite as pretty as a verandah, only broader and more useful, while its proximity to the door, and therefore to the hall, either at front or back of the building, makes the taking of meals in it involve but little extra work for the servants. Either gravel or pavement should meet the beds cut out for the climbers, and the actual floor of the shelter may be of these, or of beach shingle, red brick, or varnished boards, but should in any case slant from back to front to permit rain water to flow off.

In similar style a small garden running west to east can have north-and-south facing shelters made against the side fences or walls, with perhaps one at each end as well, for, so long as space is not too much sacrificed, there cannot be too many living-rooms. The word summer-house has, in reality, lost its meaning, for we want shelters that can be enjoyed at most seasons, and the only one that might properly be designated as for summer only would require a due north aspect; eastern or morning sunshine can be enjoyed in mid-winter, and the western sun-glow is most delightful of all in autumn.

When we come to the consideration of large pleasure grounds as veritable homes we find that rich possibilities of enjoyment are before us. In addition to open-sided huts facing each aspect, we may have also the pavilion in a centre position, either shuttered, or merely roofed and pillar-supported, after the fashion of a band-stand; there are many reasons why a roof-garden on the top of such a building is to be recommended, for it will have a beautiful original appearance when its plants are luxuriant and its railing all wreathed by the climbers from below; it is bound to give the best panoramic views of the garden, and catch the least breezes of summer, and upon its elevated plateau all the winter sunshine will be experienced.

Then there are arbours. These require time for their builder, so may be seen to perfection only in established gardens. An ivy thicket, hollowed out, the centre of a variegated holly bush, and a venerable Siberian crab trained marvellously about poles and wire, remain in my memory as exquisite arbours of long growth. Our great grandfathers delighted in sweet briar and jasmine for this purpose, or honeysuckle, clematis, and yew or privet. The supports are of little consequence, intended to be entirely hidden when the living wood has been trained into shape. Bean sticks, over-arched and bound securely into shape, are suitable.

A sufficiently tall wall, belt of trees or shrubs, thickly clothed trellis, or a fence running from east to west, will give an agreeable line of shade to sit in; one in another position will serve to shut off cold winds and concentrate sun-warmth. There should be plenty of seats in the open, set where games can be watched or charming floral views admired; these ought to partake of the character of the surroundings; a rock garden, for example, looks best with a seat formed of slabs of rock, boarded for the seat, the wood painted to cunningly resemble the stone; a water-garden seat I once saw was merely the stump of a cut-down willow, from the back of which sprouted delicate branches; a woodland seat may be just a laid-down piece of trunk, flattened on the top, then coloured over, or a bench with back and foot-rail all made out of natural twisted wood. In the neighbourhood of a white stone mansion with pillared verandah of the Italian style a classically-formed wooden seat, painted white could be chosen; the Elizabethan manor generally shows simple benches set against ivied walls in angles; a rude wooden bench on trestle-shaped supports is in keeping with the farmhouse or cottage garden.

Rustic garden furniture, deck and carpet chairs, folding stools, portable footstools and carpets, rush mats, rugs, cushions in variety, should be kept stored in a dry summer-house ready for use. I saw a shelter made in a wall corner the other day that had long, painted box seats, in which small stores were quite safe. The outside of this house was of lattice, the doorway outlined in virgin cork, with pockets ready for trailing plants, but the roof was of substantial deal, green-painted.

Tents are only of real service during summer heat, when set where there is shade, as otherwise they become unpleasantly warm; beneath tall trees they are an admirable shelter, keeping off drip from the branches, strong or cold winds, and the gaze of neighbours or passers-by. During autumn and winter tents can be made great use of in the open places of suburban gardens however. Then the extension, or porch-way roofing of a tent is often the giver of a delightful stretch of shade upon lawn or gravel.

A homely simple shelter may be created by fixing four eight to ten feet tall bamboo or other poles into the ground as a square, and stretching canvas, preferably green, or glazed calico, or striped matting, round on all but one side, fastening it by strings here and there. This roofless room proves very useful, or a piece of the material can be fixed across the whole or a portion of the top if desired.

M. H.

AMONG THE ALPINE FLOWERS.

"And now the young and flowery-kirtled May,
Decks the green hedge and dewy grass unshorn
With cowslips pale and many a whitening thorn."
—Bamfylde.

May came in with a harsher mood than is her wont, yet the flowers have responded smilingly to her call. Some have delayed, but the many have given their beauty with their wonted freedom, and the alpine flowers have borne, and are bearing, their charming blossoms with all their will. From slope and terrace and over rough stone there are sheets of colour and groups of beautiful flowers, each appearing to rival its neighbour or to combine to do homage to fair-handed May. It is difficult to roam among these flowers without wishing that more space were available to recount their beauties, but some must be left unhonoured and only a few can have the imperfect tribute of the pen.

Heaths.

There are some who think that the ericas should have no place in the alpine garden, yet without them we miss many of our most valued and valuable little shrubs. The heaths are in perfect keeping with the other flowers, and their beautiful foliage clothes many places where bareness would be too present for our sense of enjoyment. One of the most enduring in flower is that valued hybrid erica known as Erica hybrida and as E. mediterranea hybrida. Although with me it first came into flower in November last for the season, it is still in bloom, although not so perfect as for months before. Yet a plant which will give us flowers for six months of the year at a stretch is surely invaluable, especially as these months are the most barren of flowers as a whole. Not more beautiful than Erica carnea—understood to be one of its parents —it is more lasting, and no garden where it will grow should be without it. It is a mistake to think that it and other hardy heaths require peat. Mine are almost all without any, but in stony loam, and they are as healthy as plants can well be.

Erica lusitanica or codonoides.

A truly fine heath for the rock garden of some size, is Erica lusitanica or codonoides, which, now that May has well entered upon its course, is very beautiful, with its dark green foliage all bedecked with its deep flesh-coloured flowers. It is taller than many, and low by the base of the rock garden it looks well, while high on the rockery it will assume a more compact form, because more exposed to the stress of the storms. It is universally admired; and, although not a new plant, it is a heath which but few seem to know at the present time.

The Double Apennine Anemone.

While there are many of us who are not greatly enamoured with the double varieties of some of our alpine flowers, it would be pedantry to despise those which have some points to commend them, and there are certain things which in their double forms are exceedingly beautiful or highly interesting. In the latter category one would place the double Apennine anemone, A. apennina flore pleno, whose small flowers are daintily symmetrical, and are charming in their own formal way. Several rows of segments are arranged in a most fascinating way, and few there are who see it who are not charmed with this feature of the flower. Yet it has its defects, and one—and a serious one, in truth—is that it is but a sparse flowerer, when compared with its single sister-flowers. Thus it is of little service as a rock plant where a mass of flower is required, and that wonderfully fine variety of the Apennine anemone called purpurea could give it many points, and yet win hands down as an effective plant. Yet one finds a charm about this double anemone, with its symmetrical light blue flowers.

The Armenian Fritillaria.

There have been few more admired fritillarias in my garden this season than the pretty and quaint little Fritillaria armena, which is one of the almost ideal bulbs for the choice rockery, where as many things as possible are desired which are of truly dwarf habit. It is by no means new, although hardly ever met with in the gardens of the present time, but a clump or two on a good rock garden will be found an acquisition. There are some two or three varieties, but the best and brightest is that often known simply as F. armena, and sometimes as F. a. aurea. It is a very dainty little plant, only some three or four, rarely six, inches high, and having bonny little drooping bells, whose interior is of a bright golden yellow, although the outside is duller in hue. The variety rubra has the flowers more red than yellow, but these do not look so well on the rockery as the others. One may suggest that when this fritillaria is being purchased, a few bulbs should be bought and planted about half an inch apart. If only one is planted it will have little appearance, and, besides, the slugs, which generally seek to deprive us of our "one ewe lamb," will, almost certainly, crop the single one to the ground, although frequently leaving a clump untouched. This pretty little fritillaria is now cheap to purchase in quantity for the garden.

The American Dogs' Tooth Violets.

One need hardly apologise for the introduction of yet another bulbous or tuberous flower, seeing that this time it is one of the most charming of all in the shape of the erythronium, or dogs' tooth violet. Later than usual, I think, the American varieties have again come to charm us, and they may well be commended to all who have in their rock gardens some half-shaded spot, in which to cultivate these most delightful flowers. Our European E. Dens-canis, charming though it is, is eclipsed in grace by its kinswomen from the New World, and some of these are simply exquisite in their growth, their form, their poise, and in their charms of flower and leaf. Some of them are yet in flower as this is being written, and one goes out among them with pleasure to study their lovely flowers of yellow, cream, purple, or pink, and their mottled or marbled leaves of highest beauty. E. giganteum, the pretty lilac E. Hendersoni, E. Johnsoni, with bonny rose flowers, and a few more are yet handsome as they spring up behind the rockwork, and shielded by it and shrubs from the strongest sunshine.

Other Flowers.

Thus might one go on as we walk among the plants and come into the study bringing with us the visions of the flowers we have seen. There are many aubrietias, and sheets of snowy arabis. There are spring phloxes, hanging over the stones and coming full into flower to give in a day or two perfect sheets of blossoms of white and lilac and purple and crimson. There are trailing and erect brooms, the double gorse, flowering quinces, shrubby spiræas, narcissi galore, even yet; golden alyssum, bright polyanthuses and primroses, with allied cowslips and oxlips, and several primula "species." We see bright daisies, many saxifrages, waldsteinias, and the many more of the flowers which Queen Flora places at the command of her subjects when once they have sought and earned her favour—a favour to be won only by its being made the guerdon of love for and admiration of her most beautiful flowers.

S. Arnott.

SCHIZANTHUS RETUSUS.

For the purpose of the conservatory and drawing-room schizanthuses have attained to a high state of popularity within recent years, the advent of the hybrid selections, including Wisetonensis, creating new interest in them. They have no commercial value for the supply of cut flower, and in gas-lighted dwellings the flowers quickly fade even when they are home-grown. But when other means of lighting are employed, and the rooms are not overheated, they will last for at least a fortnight in a good state of freshness. The merits of the hybrid stocks of schizanthus have been often subjects of comment, but the dwarf bright forms of S. retusus do not apparently invite so much criticism. The reason for this lack of enthusiasm on the part of growers may be explained partly because their culture has been so limited, and greater space devoted to the other larger-growing kinds. At the present moment we have a small span-roofed structure devoted to the S. retusus types entirely, and the wealth of brightly-coloured blossom is certainly convincing even to the most casual mind, judged from a spring decorative standard.

Viewed under these limitations one is made to wonder why such easily-grown and intensely bright flowers are not more sought in spring. We certainly do not discourage the claims of the Wisetonensis group, for their multicoloured flowers render them so indispensable for home displays, but we still claim that S. retusus has its own individual value and purpose. In one particular these stand out clearly, and that is found in the later or successive order of their bloom. For the months of April and May these latter stocks are particularly valued, because from autumn-raised seed they afford displays in these spring months, when there may otherwise be a dearth of subject. A very pretty break from the type is S. retusus rosea, the gold crest on the petal of the type being absent in this kind, and the rose shade being pronounced places this in the forefront of favourites. Then there is the white-flowered stock, which afford yet another interesting section.

One great advantage of these retusus types is their dwarf, neat habit. Grown cool they scarcely call for the need of a stake to support their flower spike, and the dense, tuft-like leafage adds a pleasing contrast to their brightly coloured blossom. The popular term, "poor man's orchids," may be more aptly applied to these than to the other types, because of their resemblance in colouring to the Table Mountain orchid. Disa grandiflora. We are convinced that were growers to grow these in rather larger numbers spring impressions would be such as to justify, and more than justify, the extension, because, as we have already intimated, they fill a breach in spring furnishings so usefully and effectively.

W. Strugnell.

Rood Ashton Gardens.

For pretty gardens and lovely flowers read The Flower Garden, by T. W. Sanders, F.L.S. An up-to-date work on the formation, planting, and management of the garden, with description and cultivation of flowers and plants adapted for outdoor culture. Price 7s. 6d. net, by post, in box, 8s., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London

THE FURZE.

"And what more noble than the vernal furze,
With golden baskets hung?"

In answering the question thus put by Hurdis in one of his charming lyrics, there would be no great difficulty in mentioning a considerable number of trees and shrubs that might well claim to possess a greater degree of nobility than the shrub under consideration. But it would not be easy, if indeed possible, to mention one that could well be substituted for it, whether for clothing the open common or producing rich colour effects within the enclosed garden. The furze has a character wholly its own; it blooms with such prodigality that Mary Howitt speaks of it as

"The yellow furze, like fields of gold
That gladden some fairy regions old."

The flowers are not only borne in great profusion, but they are of the richest golden hue, and delightfully fragrant, and when the conditions under which the shrub is grown are favourable to flower development bold groups produce colour effects of unsurpassed richness. The principal season of flowering is confined within the months of May and June, but the golden blossoms are borne more or less freely throughout the year, and this continuity of flowering has given rise to the old Scotch saying that, "When the furze is out of bloom kissing is out of season."

Of the beauty of the furze there should be no occasion to speak, neither should it be necessary to refer otherwise than in the briefest manner to the value of the finest form for planting in spacious pleasure grounds, where sunny positions can be set apart for rather large groups. But it would appear that the shrub is not particularly favoured by planters, and it therefore appears desirable to point out that excellent effects may be produced both in pleasure grounds and parks and on the margin of plantations with its aid. Of this we have unquestionable proof in the Royal Gardens, Kew, and although it is not always practicable to follow in private gardens the example set by great public establishments, there would be no great difficulty in doing so in the case of the furze, the size of the groups being, of course, so modified as to adapt them to the area of the grounds. The shrub appears to the greatest advantage when arranged in groups on the grass, but where the garden is too small to admit of this being done a few groups along the front of the shrubbery border will produce a wealth of blossom that will contribute materially to the attractions of the garden during the principal season of flowering.

Much praise has been lavished upon the furze by old writers, and just as we grow many plants from tropical regions under glass in this country, so was the shrub grown under glass in countries with a lower winter temperature than our own. The species of Ulex only thrive without special culture in temperate climes, and, broadly speaking, it is not indigenous south of France or so far north as Russia. According to tradition Linnæus complained that he had a difficulty in successfully growing the furze even with such aid as afforded by a glass structure. Dillenius, the great German botanist, is said to have been in a perfect ecstacy when he first visited this country and saw the furze-clad commons that form so conspicuous a feature of some of the English counties during the flowering season. It is pleasant to believe that this distinguished botanist was well nigh overcome with delight when he first saw, to quote from Cowper,

"The common overgrown with fern, and rough
With prickly gorse, that, shapeless and deform'd,
And dangerous to the touch has yet its bloom,
And decks itself with ornaments of gold."

But it must, in the interest of truth, be pointed out that the foundation for the belief will not bear a close examination. The earlier writers who gave currency to the tradition do not appear to have been in agreement as to whether Dillenius or Linnæus was overcome by the glorious display of the blossoms of the "resplendent furze," for both botanists are mentioned. Possibly they both enjoyed the beauty of our commons in the time of the furze blossom, when, as Swinburne writes:

"The larks are loud above our leagues of whin;
Now the sun's perfume fills their glorious gold
With odours like the colour; all the wold
Is only light and song and wind, wherein
These twain are blent with shining din."

That they should have admired such "fields of gold," as may be seen in various parts of England is not surprising, for in no other part of the world do such glorious displays gladden the eye of the flower lover. With reference to this, Mr. A. W. Wallace writes, in his "Malayan Archipelago," "I have never seen in the tropics such brilliant masses of colour as even England can show in her furze-clad commons, her glades of wild hyacinths, her fields of poppies, her meadows of buttercups and orchises, carpets of yellow, purple, azure blue, and fiery crimsons."

Gerard endeavoured to extend the cultivation of the furze to the northern parts of Europe, and he states in his "Herbal," that he sent seeds and plants to Dantzic, Brunswick, and Poland in response to applications that were made to him by botanists and others resident in these countries. With regard to the names by which the shrub is known, this old author states in his classic work, "There be divers sorts of

THE DOUBLE-FLOWERED FURZE (ULEX EUROPÆUS FL. PL.) AT KEW.
"The gorse has got its coat of gold, and smells as sweet as clover."—R. Buchanan.

prickly broom called in our English tongue by sundry names, according to the speech of the countrypeople where they grow: in some places furzes, in others whinnes and gorse, and in some prickly broom." There can be little doubt that it is the ulex of Pliny, but by Bauhinus, Dodonæus, and Lobel, and other of the botanists prior to Linnæus, it was known as Genista spinosa, or the prickly broom, and from Linnæus it received the name of Ulex europæus. With regard to its popular names, furze is derived from the Anglo-Saxon fyrs, which was probably given to it from the similarity of the spines to the "needles" of the fir tree. Gorse has been derived from the Anglo-Saxon gorst, or open, in allusion to the open spaces on which it grows, and whin is derived from the Celtic chwyn, which signifies weeds or other plants of no value. With reference to the second of the two popular names, Professor Earle observes, in his "English Plant Names," "I do not know what the Latin word is, but gost is probably the same as gorst. The form gorst is still current in Shropshire, while it is gorse in the north, and goss in Kent. The word is unknown in Devon, where ulex is only called furze, or rather vuzz." In Berkshire the writer has frequently heard the shrub spoken of as goss and fuzz.

The number of species and varieties is not large, and for garden culture two will be sufficient. The common furze, Ulex europæus, is very beautiful, and highly attractive when in bloom, as exemplified by the rich colour effects it is now producing where it is established on open commons and elsewhere. It has also considerable merit as a hedge plant for dry sandy banks and for planting on waste land. Beautiful as it unquestionably is, the species is not equal to the double-flowered form, U. europæus fl.-pl., which alone should be planted in the garden or in park and meadowland contiguous to the mansion and carriage drive. The growth is the same, but the flowers of the double variety are much larger, and so freely produced as to almost hide the foliage, as indicated in the illustration of the fine group on the north side of the Syon Vista in the Royal Gardens, Kew. This is readily propagated by means of cuttings, but established plants are so inexpensive that there is not much occasion to trouble about the raising of stock at home. Cuttings taken in August, and inserted in a bed of soil in an unheated frame, or under a handlight outside, will root freely. The dwarf furze (U. nanus) is a distinct form, attaining a height ranging from twelve to fifteen inches, and flowering during the summer months. It is useful for forming small groups along the front of the shrubbery, but is hardly required in gardens of limited dimensions.

George Gordon

DENDROBIUM NOBILE VIRGINALE.
An exquisitely beautiful pure white variety, raised by Messrs. Armstrong and Brown, Tunbridge Wells.

DECIDUOUS DENDROBIUMS.

There can be no doubt whatever that the deciduous dendrobiums have not received the attention their merits deserve during the past ten years or so. Like many other well-merited and beautiful orchids they have been neglected for no other cause than the influence of popular fashion. The custom in the majority of the orchid establishments at the present day is to specialise, attention being devoted to some two or three subjects, often only one, and I venture to suggest that some of the younger professional orchid growers have little knowledge of many of the plants that were in general cultivation twenty years ago. This is not only to be regretted, but it is also a serious loss to horticulture, when we find so many of the beautiful and otherwise meritorious plants practically withdrawn from general cultivation.

A Revival in Dendrobiums.

I have been more than delighted to find that attempts have been made during the past few months by some of our prominent orchid enthusiasts, to revive the interest in the deciduous section of dendrobiums, by exhibiting collections of the finer hybrids at the Royal Horticultural Society's meetings. Perhaps none have had a more desirable effect than the subject of the accompanying illustration, D. Chessingtonensis, which was exhibited at the meeting held on April 6, from the collection of R. G. Thwaites, Esq., Chessington, Christchurch Road, Streatham (gardener, Mr. R. Black). This is the result of intercrossing D. aureum and D. Wiganiæ. Like most other secondary hybrids, it is very variable, and some most desirable and distinct tints of yellow are found among them. I consider this to be one of the finest introductions of late years, and the whole of the varieties I have seen are worthy of a place in every collection where dendrobiums are appreciated.

The Finest Hybrids.

I have been invited to name a few of the most desirable for general cultivation of the hybrid dendrobiums. I cannot do better than to mention one of Mr. Cookson's raising, namely, D. Sibyl. The delicate tints of purple, shading to almost white, renders it one of the most desirable of the late spring-flowering kinds. D. Brian, with its primrose-tinted flowers, is also highly meritorious, but it has not by any means one of the most robust constitutions, and requires much attention to retain it in a healthy state. Among the best varieties of D. Wiganiæ is the variety D. W. xanthochilum, with its golden-yellow and brown flowers. The varieties of D. melanodiscus are very extensive, and are worthy of every consideration. The same remarks will apply to D. Ainsworthi and its allied varieties, the forms known as D. splendidissimum Apollo and Mrs. Hayward being perhaps the most remarkable. D. Aspasia (aureum x Wardianum) in its best forms, such as D. A. Langleyense, has few superiors; it should have a place in every collection.

The varieties of D. Cybele (nobile x Findlayanum) are all free growing, and most desirable: there are very few inferior forms among them, and as they produce longer stems or flower stalks than most of the dendrobiums, they are more useful for cut flower purposes. D. Murrayi (albo-sanguineum x nobile) has a bold flower with white sepals and petals, and a deep maroon disc. There are many others of the well-known kinds that should also be included, and also others of more recent introduction which should have attention where space will permit. I shall refer to only one of the introductions of recent years, namely, D. Thwaitsiæ (Ainsworthi × Wiganiæ). Both parents of this form are hybrids, and, as a matter of course, considerable variation is found among the offspring. It is a most desirable addition to the hybrid dendrobiums.

Points in Culture.

The culture of dendrobiums is not a difficult matter where proper accommodation is provided for them. But where they have to be grown in association with other plants and shifted from place to place to secure suitable conditions to meet their requirements at the different seasons of the year, they not only require more attention, but it is by no means easy to produce the results one would wish. It is above all desirable to secure a position where only the scorching rays of the sun are broken, as under such conditions little difficulty is found in providing the necessary high temperature, which secures rapid advancement in growth. This is a most essential point under the climatic conditions that usually obtain in this country, and especially such as have been experienced of recent years.

Another condition that is essential to success is having a young stock of plants, either raised from seed or propagated by cuttings. We hear much about large specimens, and these are not difficult to procure in the case of some varieties of the species, but I have invariably found that it is from the young and more vigorous plants that we obtain the best flowers and the most satisfactory return. To procure a succession of young plants annual propagation is necessary. As I have only recently referred to the propagation methods in the Work for the Week columns, there is no need to deal further with the subject of culture here.

Dendrobium nobile virginale.

The so-called albino variety of D. nobile has now been in cultivation for some years, and has become generally distributed in gardens. The most remarkable exhibits that have ever been seen of this most valuable addition were those of Messrs. Armstrong and Brown, of Tunbridge Wells, at the Manchester Orchid Show, in April of last year, and again on April 5 last at the Royal Horticultural Society's exhibition, when over 200 finely flowered plants were included in the group, for which the firm was most deservedly awarded a gold medal.

This variety is considered to be altogether more robust, the flowers are larger and finer in substance than any of the varieties known. It is interesting to note that the whole of the plants shown by Messrs. Armstrong and Brown were raised from seed, the result of crossing a flower with its own pollen, giving another illustration that these so-called sports are fixed characters when in-breeding is resorted to, and reproduce themselves true to their albino characteristics from seed.

The accompanying illustration of D. nobile virginale represents one of the smaller plants included in Messrs. Armstrong and Brown's gold medal group, and [illegible] the freedom with which the variety produces its pure white flowers. The example of D. Chessingtonensis herewith illustrated was also shown by the same firm in their collection, with a considerable number of other fine hybrids.

ANNUAL STOCKS.

In point of beauty and general utility few annual flowers are more deservedly popular than the innumerable variety of stocks. They well repay care and liberal cultivation from the time the seed is sown until the plants come into flower. One of the best dwarf stocks is All the Year Round, a glossy dark green-leaved variety, only twelve inches in height, with exquisite double white flowers. Princess Alice is difficult to surpass as an all-round white stock for the supply of cut flowers; the foliage is dull grey-green, and the flowers are perfectly double. Mammoth White is a counterpart of the former, growing a little taller, being rarely under two feet in height.

The coloured varieties represented by the dwarf Bouquet and grandiflora types of ten week stock are extremely valuable for massing purposes in beds and borders. In some gardens objections are raised to their restricted flowering season, consequently late sowing is advisable under these circumstances, unless facilities exist for supplementing these when spent, by later-flowering subjects.

East Lothian stocks, especially the wall-flower-leaved sorts, are valuable both for pots and the open ground; plants raised in autumn and wintered in pots in a cold frame will produce their flower-spikes through all the summer; these eventually make bushes three feet or more in height.

Beauty of Nice, Queen Alexandra, and similar stocks, when sown in autumn, potted up, and grown in a cool greenhouse through the winter, produce plants four feet in height, with massive pyramids of blossom over two feet in length. These come into flower along with Schizanthus Wisetonensis and pinnatus in time for Easter, and give a rich display for quite six weeks. These latter varieties, when sown in March, are equally valuable for furnishing an autumn display in the open garden.

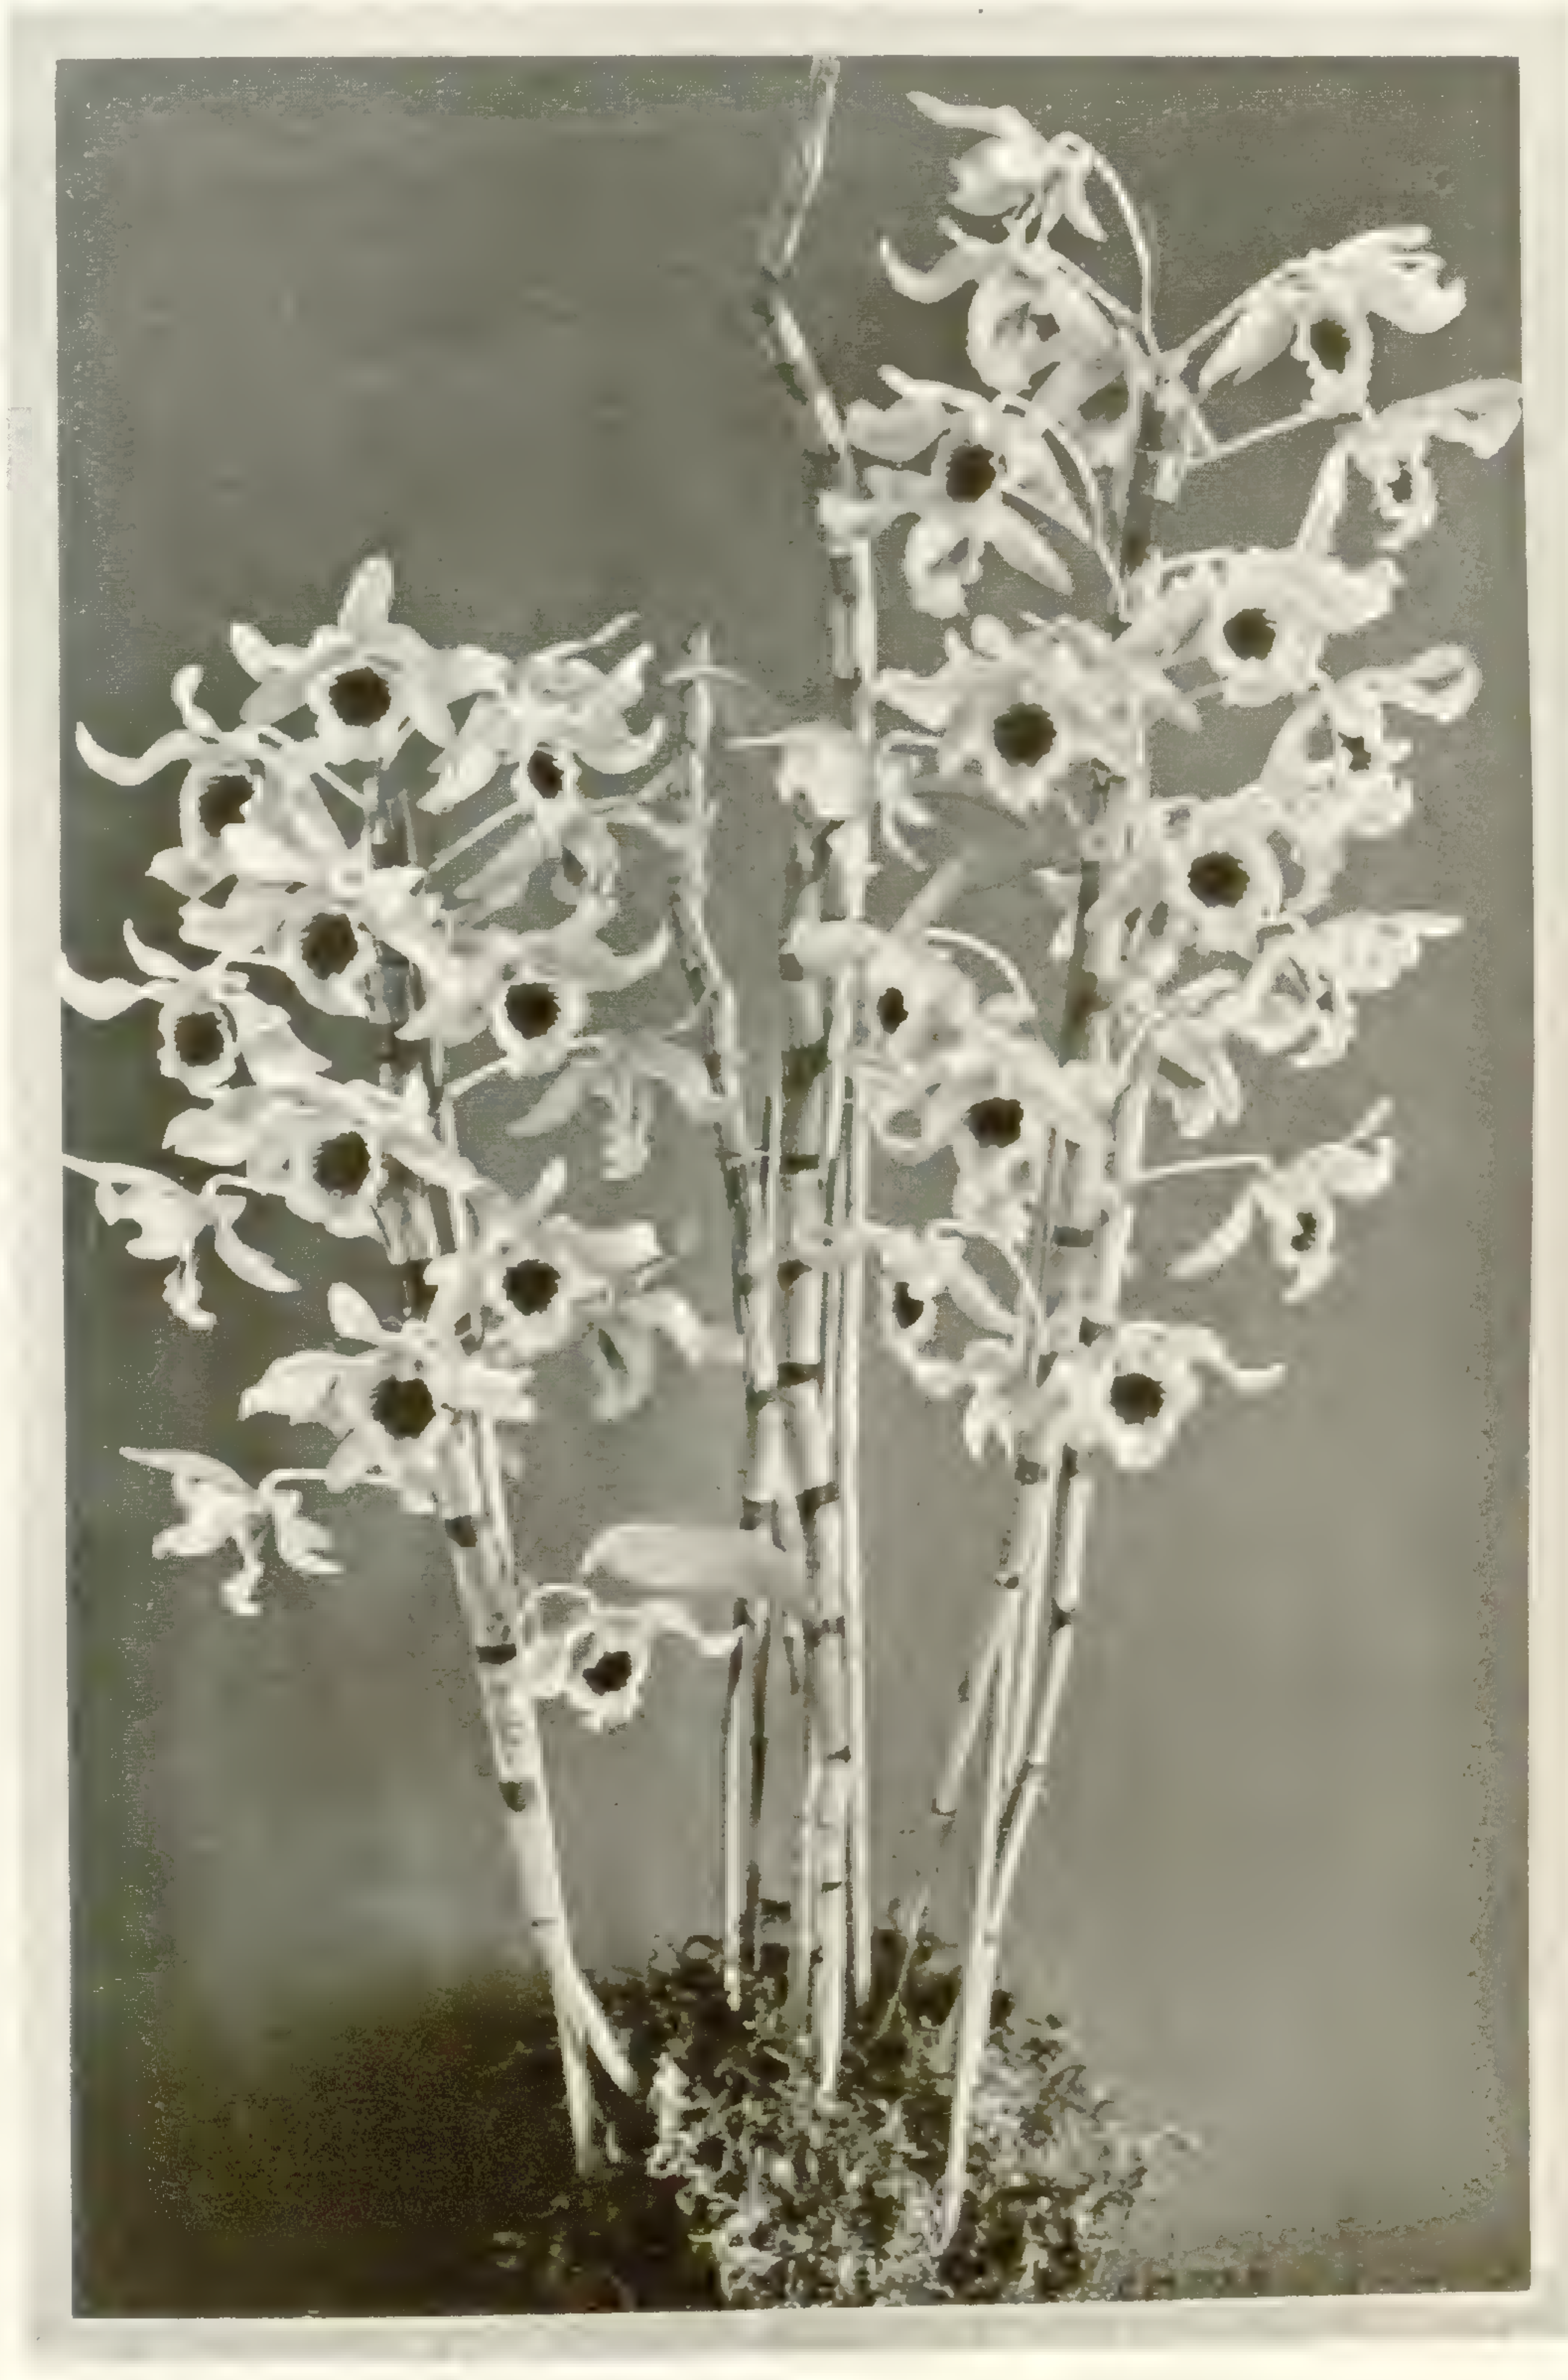
Walmsgate Gardens.



DENDROBIUM CHESSINGTONENSIS.

A beautiful hybrid bearing deep golden flowers, recently exhibited at a R.H.S. meeting by Messrs. Armstrong and Brown, Tunbridge Wells.

Lettuce Stansted Park. Those who require a liberal supply of a good cabbage lettuce in April with but a minimum of trouble, would find this a good variety. The present has been a trying season for autumn-planted lettuce, but this variety has passed through the severe frost, wind, and at times excessive rain and snow, in quite a satisfactory manner, and as such it should be recommended to those who have no cold frames or even cloches to aid them in securing April lettuces.—E. M.

RHODODENDRON RACEMOSUM.

A great many species of rhododendron have been introduced from China within the last twenty years, some of which are likely to compare favourably with those that have been common in gardens for many years. The larger-growing species will, however, doubtless be many years before they attain flowering size, but in the meantime many of the dwarf-growing, small-leaved sorts, will prove their worth. R. racemosum was one of the earliest of the species from Western China to be introduced, and it blossomed in this country seventeen years ago. When it first flowered, it was recognised as being likely to prove first-rate for the garden, providing it proved hardy. Subsequent observation has proved that the species is more than worthy of all that was said in its favour at that time, whilst the question of its hardiness for most parts of the country has been proved beyond doubt. It is one of the many beautiful garden plants that were first collected and sent to Europe by that indefatigable French missionary, Father Delavay. He is reported to have collected more than 4,000 species of plants between 1883 and 1896, of which Franchet, who dealt with his collection at the Museum of Natural History, Paris, says 1,500 were entirely new species.

Seeds of R. racemosum were sent to Paris in the first instance, but Messrs. Veitch, of Chelsea, were the first to bring it to notice in this country, about 1892, when flowering plants were exhibited. It was noted in most of the garden periodicals about that time, and in 1893 it was made the subject of a plate in the "Botanical Magazine," t. 7,301. Although it blooms freely when but an inch or two in height, and is frequently met with as a small bush a foot high, it attains larger dimensions, and grows at least to a height of 2½ or 3 feet. When growing well it is of free habit, but in poorer ground it forms shorter shoots and is somewhat dense. The leaves are small and evergreen, glaucous on the undersurface. The flowers have a white ground, more or less heavily flushed with pink, and are borne in axillary and terminal inflorescences, each branch having the appearance of a raceme of flowers.

The flowering period is the latter end of April and early May. In the past it has been rather expensive, which has prohibited its planting on an extensive scale; of late years, however, it has been decidedly cheaper, so in the near future it is quite likely that it will be planted extensively. It has been propagated largely at Kew both from seeds and cuttings, and several large masses are to be found about the gardens. W. D.

THE NEAPOLITAN CYCLAMEN (C. NEAPOLITANUM) IN LEAF.

LILY OF THE VALLEY IN OUR WOODLANDS.

In some of the woods surrounding a private residence in Bournemouth lily of the valley grows luxuriantly, and, while walking through these woods recently with the owner, he pointed out the thriving roots of this flower. The leaves are of grand proportions, and the crowns equally so. The flowers are large, and borne on very strong stems, I am assured. I know that the lily of the valley grows extremely well in the woods near Morecambe Bay, either in Cumberland or Westmoreland; in the last-named county, I believe, but in the Bournemouth instance the plants have no better rooting medium than almost pure sand.

I have grown lily of the valley in large batches in private gardens, both in the shade and also in hot south borders, fully exposed to the sun. In one garden these lily beds covered more than a quarter of an acre of ground, and I found that, where given a deeply-dug friable loam, the position did not matter much, as the plants grew and blossomed equally well in all aspects. In a wood there is always a good deal of shade during the growing period of the lilies. I feel very sure that the lily of the valley should be more extensively grown in our woodlands than it is at present. Perhaps some readers know of instances where the plants thrive in such circumstances. G. Garner.

CYCLAMEN NEAPOLITANUM.

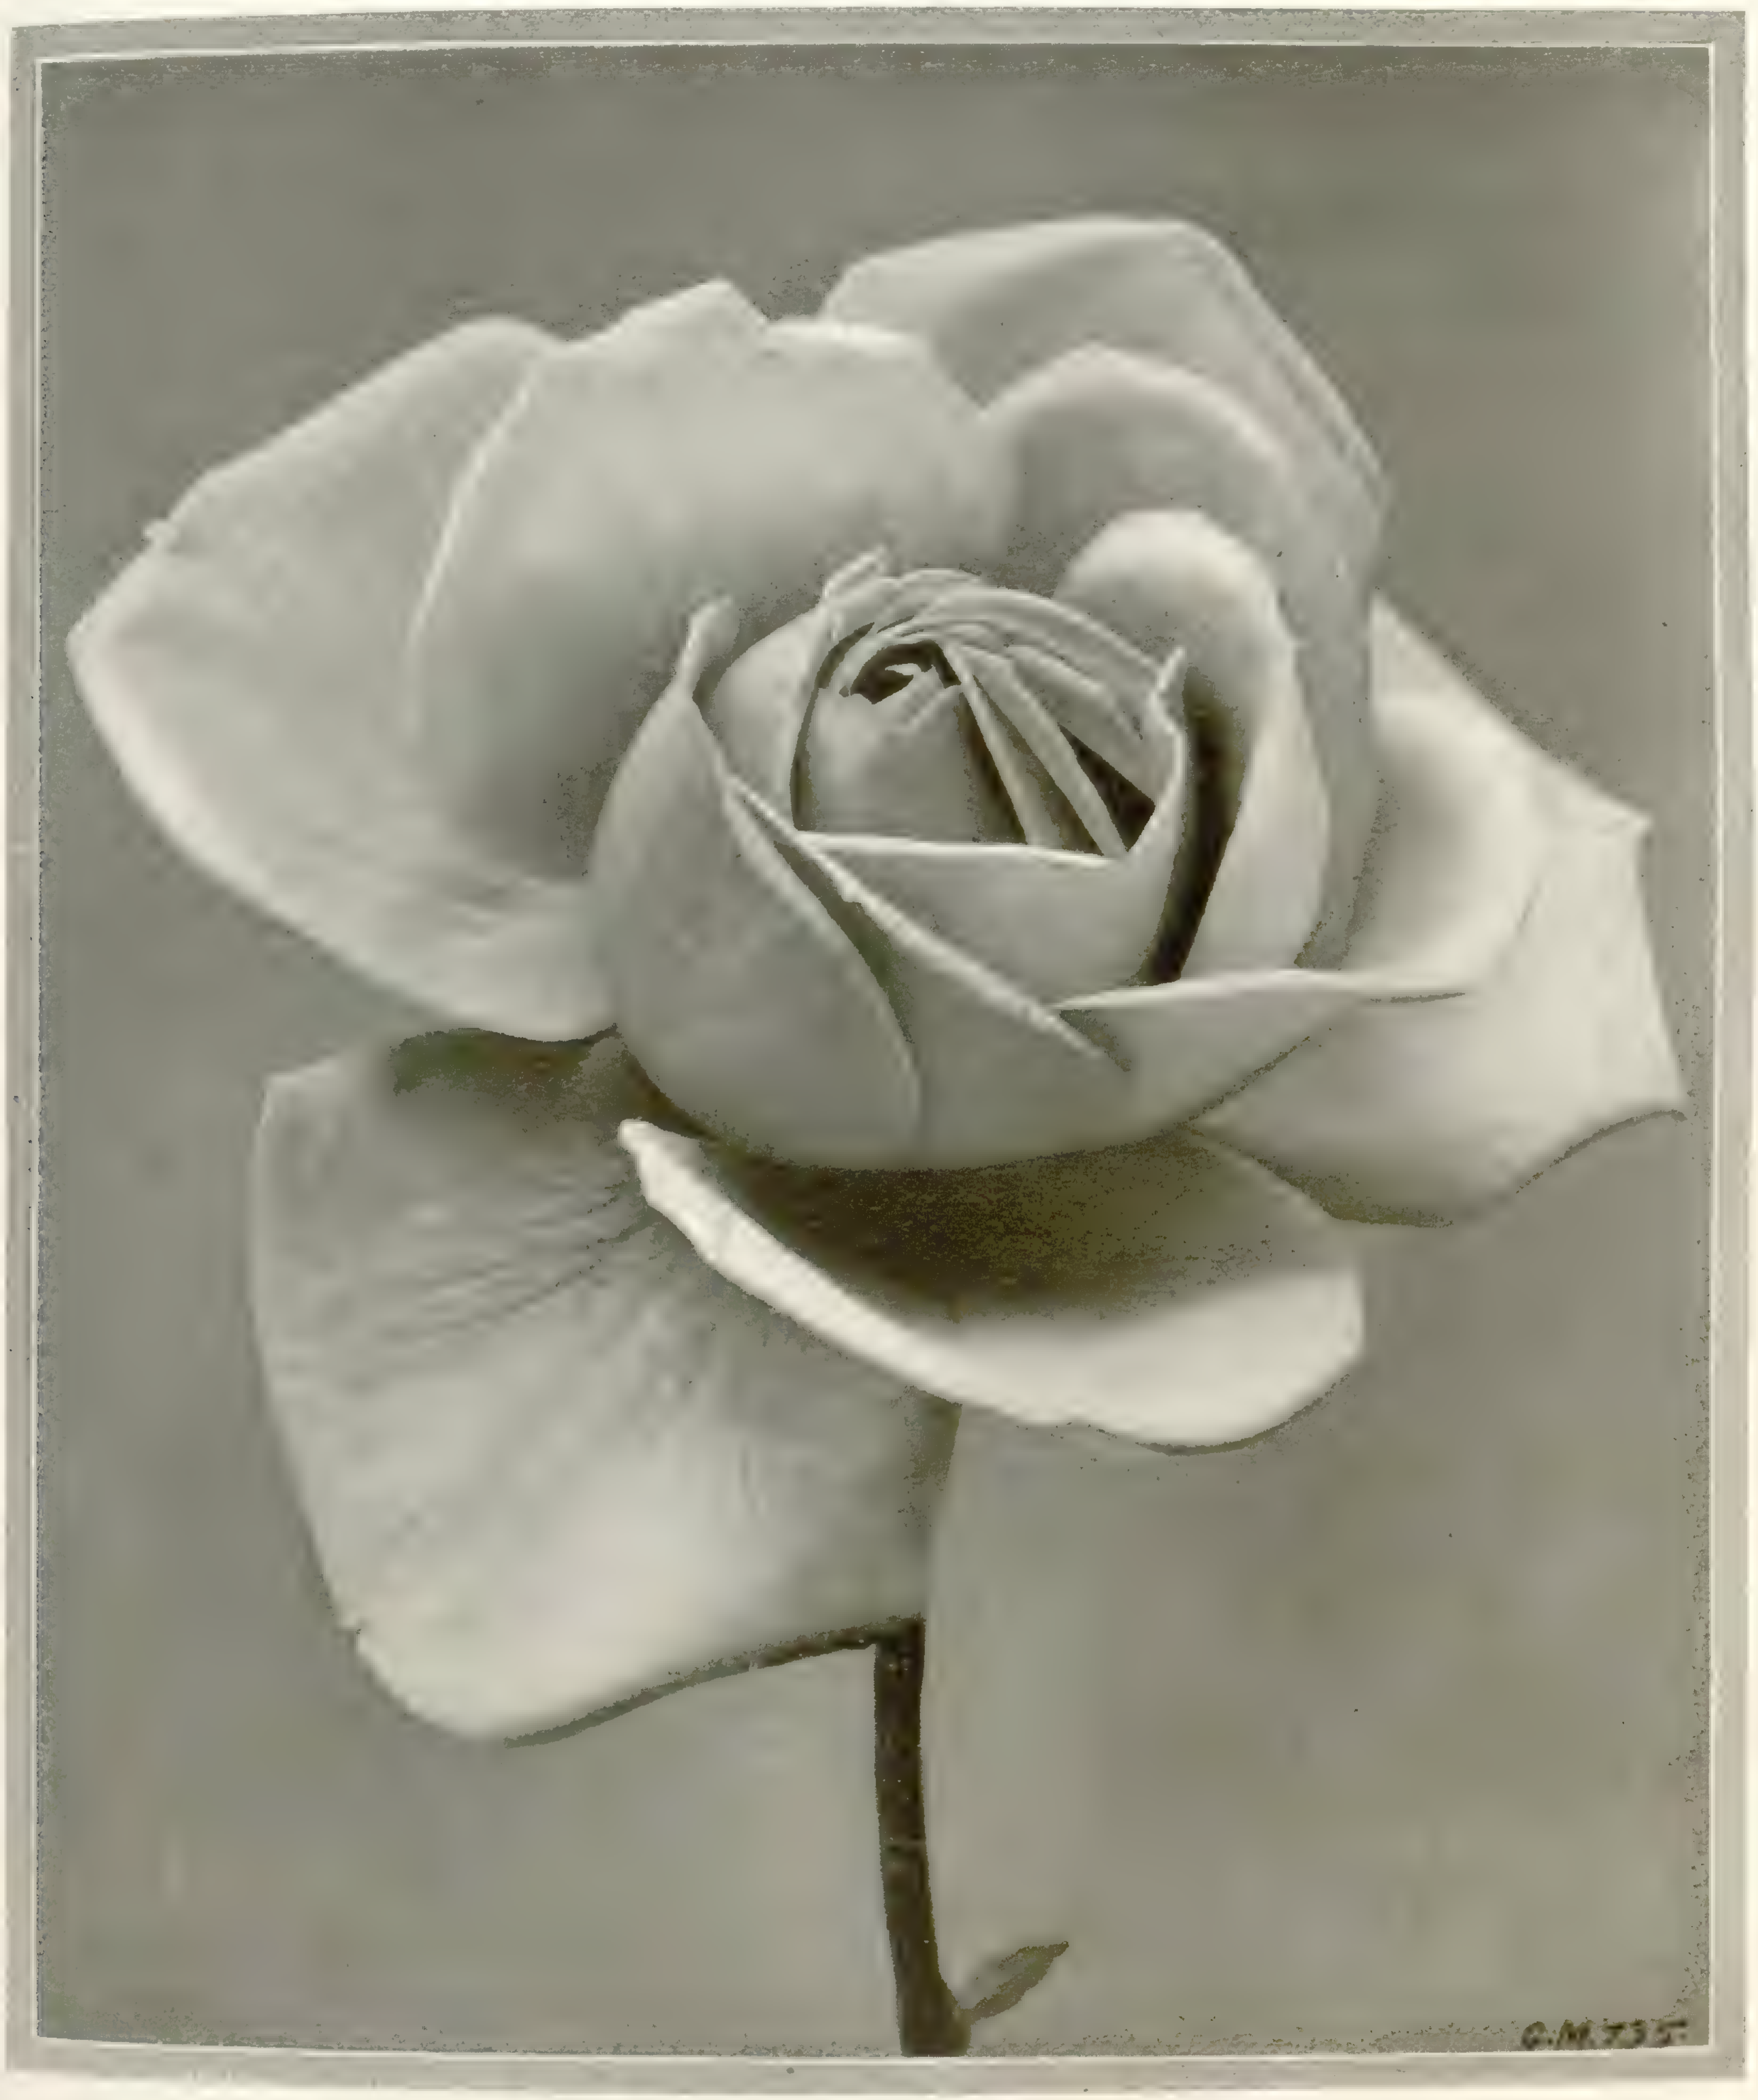
During the autumn the hardy cyclamen are very valuable in the rock garden, and the above species, and its white variety, give a profusion of flowers for about six weeks, but the termination of their attractiveness is not yet. When the flowering period is coming to an end the beautifully marbled foliage is produced, which is doubly welcome at this time, when most plants are losing their fresh appearance. In the Cambridge Botanic Garden a colony occupies about a square yard on the rockery; some of the corms have been there many years, and are now of immense size, as much as six inches in diameter. They are also very useful in the wild garden, and do not mind a position which is naturally dry during the summer, especially under the shade of deciduous trees.

E. J. Allard

THE NEAPOLITAN CYCLAMEN (C. NEAPOLITANUM) IN BLOOM.
The flowers, white or red.

THE LYON ROSE.

The rose that we have the pleasure of illustrating herewith is one of the fine varieties introduced to cultivation by Messrs. Pernet-Ducher in the autumn of 1907. Previous to its distribution this beautiful hybrid tea created much interest among the rosarians who had an opportunity of seeing it in the nurseries of the [illegible] and elsewhere, and it was generally anticipated that it would prove a useful [illegible] to its class. This anticipation has been fully realised, and those who had an opportunity of growing the variety last [illegible] conditions favourable to its full development regard it with much favour. At the second of the two April meetings of the Royal Horticultural Society. Messrs. William Paul and Son, Waltham Cross, included several finely flowered examples in the large and beautiful collection of pot roses they exhibited on that occasion, and the splendidly developed and attractively coloured flowers secured for the plants a full share of attention. The form of the blooms is well shown in the accompanying illustration, and, as indicative of the size, it may be mentioned that the bloom illustrated was one of several growing on a plant occupying a pot of medium size. The colour is exquisitely beautiful, and may be described as coral red suffused with yellow in the centre, shading to shrimp pink towards the margin. The flowers are fragrant, the growth is vigorous, and the flowers freely produced. The National Rose Society describe it as valuable for garden decoration, and the examples shown by Messrs. W. Paul and Son indicate its usefulness for pot culture.



THE LYON ROSE.

A new H.T., exhibited by Messrs. W. Paul and Sons, at a recent meeting of the Royal Horticultural Society. The blooms are of large size, and exquisitely coloured coral-red, yellow, and pink.

Apple Lord Burghley.—For years I attempted to grow this apple here, amongst eighty other varieties, and gave it up as a failure. When I did obtain a crop the fruit was so hard as to be uneatable at any time. Certainly the fruit will keep a long time, but, what of that if it is of no value. The tree was upon an English paradise stock. The soil is inclined to be heavy, but in this case at planting time much foreign matter was added, such as decayed vegetable refuse, wood ashes, and old potting soil. Seldom do I meet with the variety, although my rambles are not confined to one county.—E. M.

PREPARING BEDS AND BORDERS.

All experienced gardeners are fully agreed that the majority of the plants now used for long-continued masses of bloom are as exhausting to the soil, and require to have as good foundations laid for their culture, as many or most of our vegetables. It is a matter of very great importance that the principles of good cultivation, in so far as the preparation of the beds is concerned, should be specially noticed. There are good reasons for fearing that the miserable appearance of many a villa and cottage flower plot owes its origin to the idea that our present flower garden plants do not require careful cultivation, such as would be expected to produce good crops of vegetables. I wish to give prominence to the fact that, in order to produce fine healthy plants and a long-sustained array of bloom in the case of the great majority of the plants used, it is indispensably necessary that the beds be well drained, deeply worked, and well manured.

Few subjects are more exhausting to soil than masses of verbenas, heliotropes, calceolarias, etc., and the unsatisfactory appearance which these frequently present is as often referable to the want of liberal treatment as to anything else. An accumulation of water about a bed of flowers is productive of evils that will thwart the efforts of good management in all other respects; it will keep down the temperature of the soil, prevent the natural action of the atmosphere, and lessen the chances of getting the soil pulverised and sweetened. Every flower bed that is wet should therefore be well drained, as a first step to successful flower gardening. As to deep cultivation the benefits derivable from it are so many that it would be difficult to enumerate them all. It gives a greater degree of openness to the soil, so that the roots can penetrate it more easily, and in dry seasons go down where the soil is more moist, and escape to a greater extent the evils of drought. In wet seasons the superabundant water escapes more freely to the drains or subsoil. Many other benefits might be referred to, but these are sufficient to show that deep cultivation is of much importance in flower beds and borders.

Where it is practicable to carry it out, a rule should be made to trench every other year both beds and borders. This is best done in winter, and a rough surface left, exposed to the frosts, and the beds forked over and thoroughly pulverised before planting time.

The extent to which manure must be applied must be regulated by the nature of the soil, and dryness or wetness generally of the locality. Where the soil is naturally shallow or light, or sandy, it is greatly improved by having a quantity of heavy loamy soil incorporated with it. The best manure for sandy soil is cow dung, which has been in a heap for at least twelve months, and has lost its rankness; the next best is old well-rotted hotbed manure, that is, stable dung well decayed; but for heavy loamy soils well-decayed leaf-mould is preferable. These manures should be applied when the beds are trenched in the course of the winter, and incorporated well with the staple. All rank or partially decomposed manure should be avoided, and when well-decomposed manure cannot be had, spread it over the surface of the bed, and let it lie exposed to the air before digging or trenching it into the soil.

Those who are fortunate enough to have a deep and rather light loamy soil that can be trenched from two to three feet deep, and a dry subsoil, have a great advantage over others who have either a shallow, poor soil, or one that is wet and clayey. It will scarcely be believed by those who have not seen them how vigorously most plants grow and bloom in deep light loam, resting on a dry bottom, which should be the standard to be guided by. Those who have small gardens, particularly near towns, have great disadvantages to contend with, if their soil is naturally bad. Generally, they cannot easily get their few borders either entirely remade, or ameliorated where the soil cannot be wholly replaced. Clay is more effectually improved by turning up the subsoil and mixing it with the best of the surface soil, than by any other means. Road grit or light sand added to it will also improve it, and when soil is sandy and poor the subsoil should be removed, and heavier soil mixed with the best of the natural soil.

It need scarcely be said that, when the soil is naturally unsuitable, the most effectual way of remedying the evil is to entirely remove it to the depth of 18in. or 2ft., and replace with two parts fresh loam and one part decomposed leaf-mould. Where the rainfall is great, and many things, particularly pelargoniums grow too much to leaf, the soil should be raised more above the ground level, and of course, manure should be more sparingly applied generally.

T. B. Field.

Ashwellthorpe, Norwich.

SOME DIFFICULTIES OF PLANT CULTURE.

(Continued from page 360.)

There are at least three classes of growers. First, those who never learn anything except by bitter personal experience. The loss of one or two crops in succession by the attack of some preventable parasite usually affords such a man the needed personal stimulus. There is a second class of growers, who believe it all, know it all, and can give pointers to any expert, but are what might be called eleventh-hour men. Whether from inertia, love of ease, or inability to plan, they never get around to try any preventive until the mischief is done. Such growers are the worst to deal with, since they are pretty certain to apply some remedy when it is too late, and equally certain to declare afterwards that all such remedies are worthless, as they know from "personal experience," having tried them.

There is a third class of growers who are very quick to see, and equally quick to apply, anything likely to add to their success, and these are the growers who make their mark. In the art of the restriction of plant diseases, as in that of modern medicine, an ounce of prevention is worth many pounds of cure.

It is now generally known that diseases which prevail extensively are contagious or catching diseases, and that these are due to parasites. These plant parasites are plants or animals which have in some way lodged on, or gained an entrance into the plant, "host plant" as it is called, and there multiply to its detriment. Many of these organisms are exceedingly small so as to be readily overlooked, and all of them are well provided with means of reproduction. In the case of the parasite fungi, the reproductive bodies developed on a single host plant often amount to hundreds of thousands, and in case of bacteria even to hundreds of millions. These bodies are, of course, very small, requiring good microscopes and other facilities for their study, but if the conditions are favourable a single one of them may be all that is necessary to start disease in a healthy plant.

Why then are not all our plants destroyed outright? There is a constant struggle for existence in all animate nature, and one organism or another prospers according to environmental conditions. Sometimes the advantage is wholly with the host plant, at other times largely with the parasite. Many parasites are very sensitive to light, to heat, to dry air, and perish in a short time if exposed to these conditions. Other parasites will thrive only under unusual conditions of heat and moisture. Many of the higher plants have devised special means for their own protection, such as the physical obstacle of a thick and hard covering not easily penetrated, a waxy covering not easily wetted, a smooth covering from which the water runs off quickly, or have interposed chemical obstacles, such as a sap not adapted to the growth of the parasite.

These then are some of the reasons why all of our plants are not immediately attacked and destroyed.

To sum up or restate the case: First, the parasite is very liable to be destroyed by adverse conditions before it reaches the plant. Second, it must gain an entrance into the plant by its own exertions, or by the help of other organisms, and this may be difficult or impossible. Third, once established, its growth may be effectually stopped by insuperable chemical or physical obstacles.

Not every potential parasite becomes an actual parasite. The difficulties lying in the way are often too great for the organism to overcome, and, consequently, a good portion of our crops escape. The business of the plant pathologist is to find out just what these difficulties are in each case, of each particular parasite, and to teach the grower how he may increase them, and so check or entirely destroy the prevailing evil.

Certain parasitic diseases of plants are peculiarly soil troubles. Their home is the earth. They live and multiply in the soil indefinitely as saprophytes, and yet are always ready to become parasites when there is an opportunity. Not enough attention has been paid to this class of diseases. Among these soil fungi are some of the worst enemies the cultivator has to contend with. They are hidden out of sight, are very difficult to combat by fungicidal treatment, and when a soil area is once well seeded down to one of them it is practically worthless for the growing of such crops as are subject to the disease, the only satisfactory management of the soil in most cases being a long rotation with crops not subject to the attacks of the parasite. These soil fungi manage to get about from one area to another in various ways. Some of them are known to have been distributed in irrigation water, or to have been washed from higher to lower levels by surface water; some have been carried by the workmen's tools, or on the feet of animals. Occasionally man himself digs them up and transports them into hotbeds, greenhouses, or the open garden.

Frequently these fungi creep through the earth for considerable distances, destroying nearly everything they meet, or only certain species of plants. Others distort or corrode underground parts without destroying the plant, among which may be mentioned onion smut, potato scab, the club-root of cruciferous plants, the fairy ring fungus.

Undoubtedly these troubles have arisen, or at least have become intensified. by too frequent growing of the same crop on the same soil, and the best remedy is to be found in a wide rotation.

Harpenden. J. J. Willis.

(To be continued.)

THE IDEAL CONSERVATORY.

It is the fashion of the world to laugh at ideals. Yet all earnest men have ideals, though few attain to them. Without an ideal there can be no purpose—no progress. The ideal conservatory must be planned solely for the purpose of securing the best possible conditions for the plants—abundance of light, plenty of ventilation, a sufficiency of heat, and just enough shading during bright sunshine to break the fierceness of the sun's rays, and thus ensure a longer period of flowering for the plants. The architecture of the conservatory may be distinctly ornamental, provided that its utility as a house for keeping plants in healthy growth and full floral beauty be not thereby lessened. When the beauty of the plants is sacrificed to the beauty of the house then the conservatory is not ideal. The endeavour should be to combine architectural beauty without and floral beauty within, for to argue that the two are antagonistic and mutually destructive is absurd.

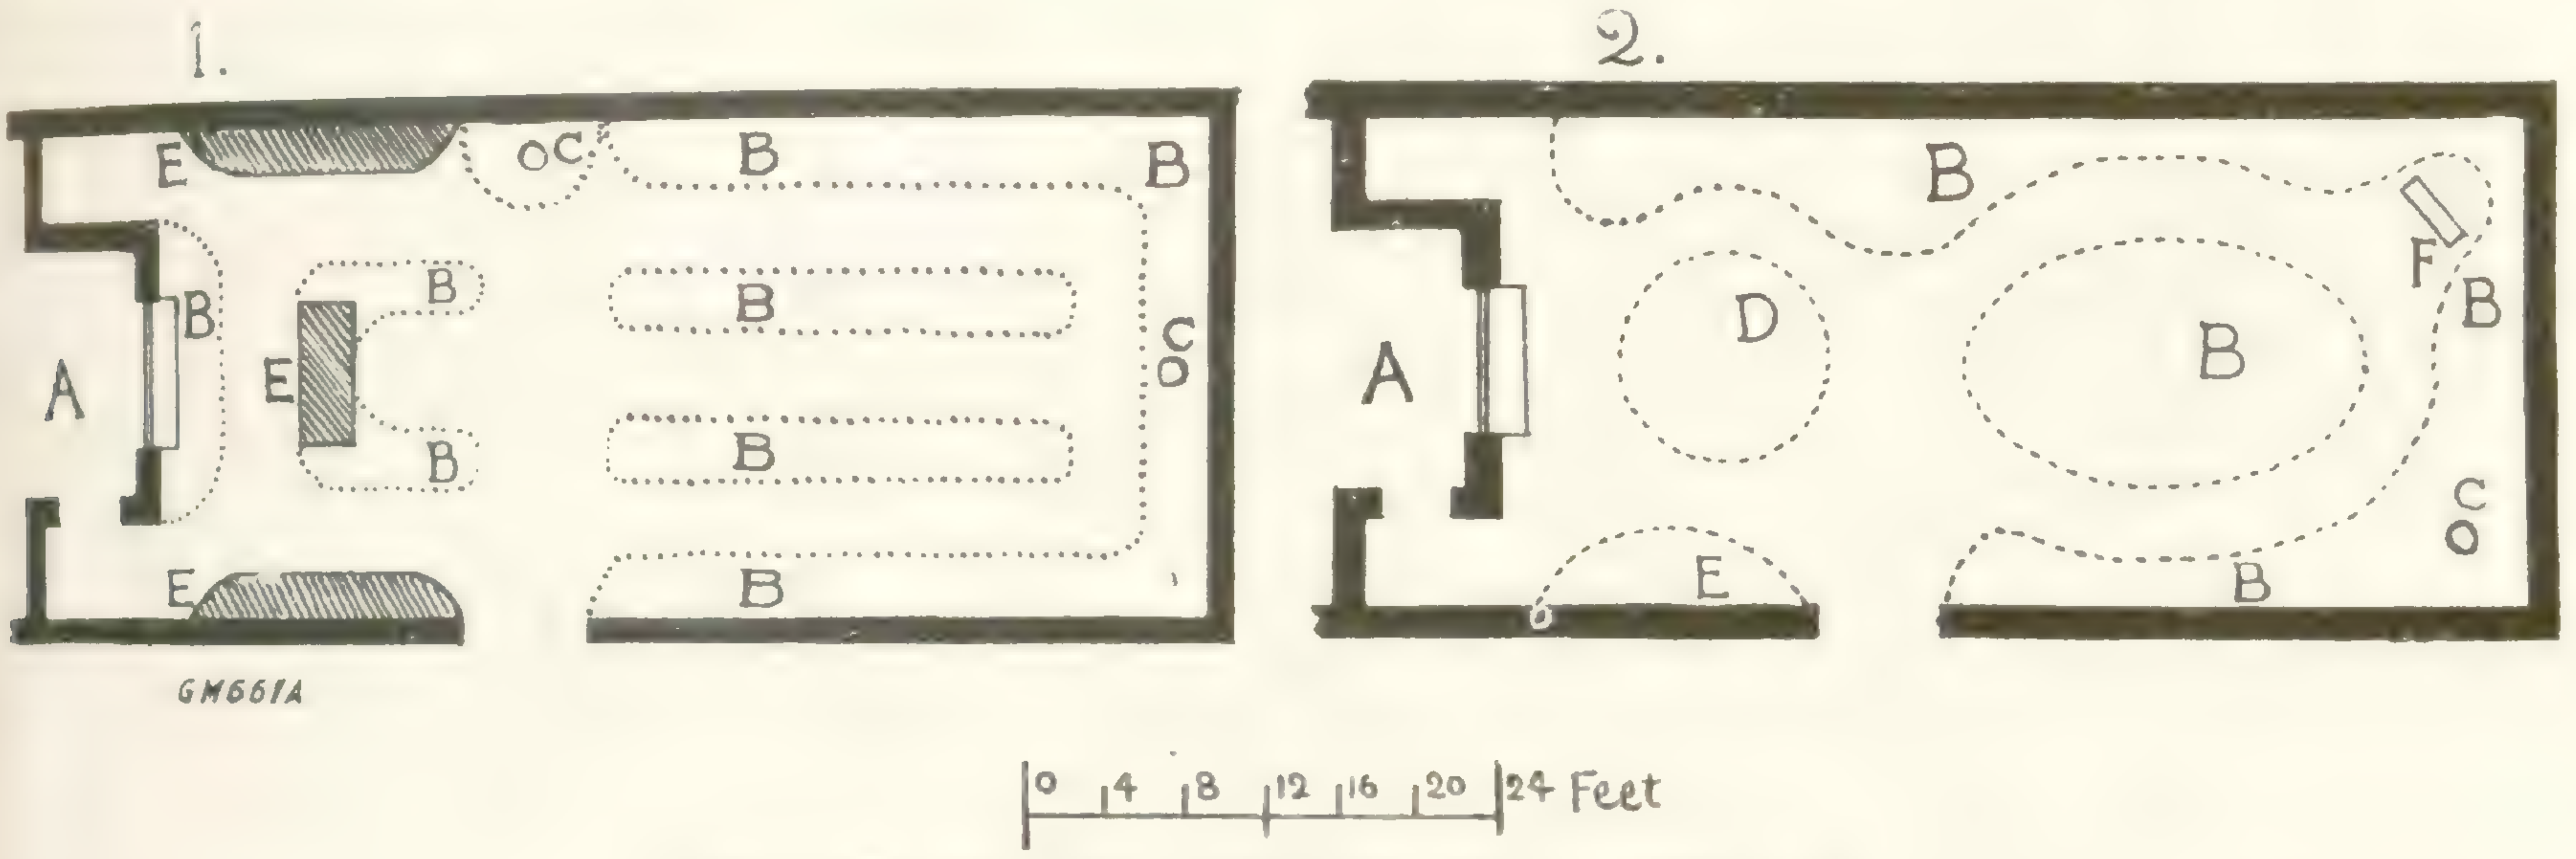
The conservatory being really an indoor garden, the work of the builder should be hidden or toned down, not because it is intrinsically unsightly, but because the array of bright flowers and sombre foliage is more exhilarating to the mind, and certainly more provocative of pleasure. Thus the walls and pillars and tie-rods would be clothed and festooned with creepers, made freely floriferous, without excluding too much light, while hanging baskets, well furnished with ferns and foliage and flowering plants, would seem to lessen the height of the structure, and be a link between the canopy of climbers on the roof and the forest of flowers on the floor. Another quality essential to the ideal conservatory is that the floor be of such a character and the walk of such a width as to ensure comfort in getting about.

In the conservatory there is not the same need for moisture-retaining material, nor the same pretext for parsimony in the matter of space, as in a house used for growing plants. Carefully laid tiles, gravel, cement, or mosaic, form very pleasing floors, the choice of which can safely be left to the will or whim of the owner. I certainly think that the floor should be all over alike, for I hold the opinion that to form stagings and beds which cannot be readily removed, is to deprive oneself of the pleasure of variety in the arrangement. Where the beds and stagings are mapped out, and are not readily removable, the arrangement of the flowers is lamentably limited.

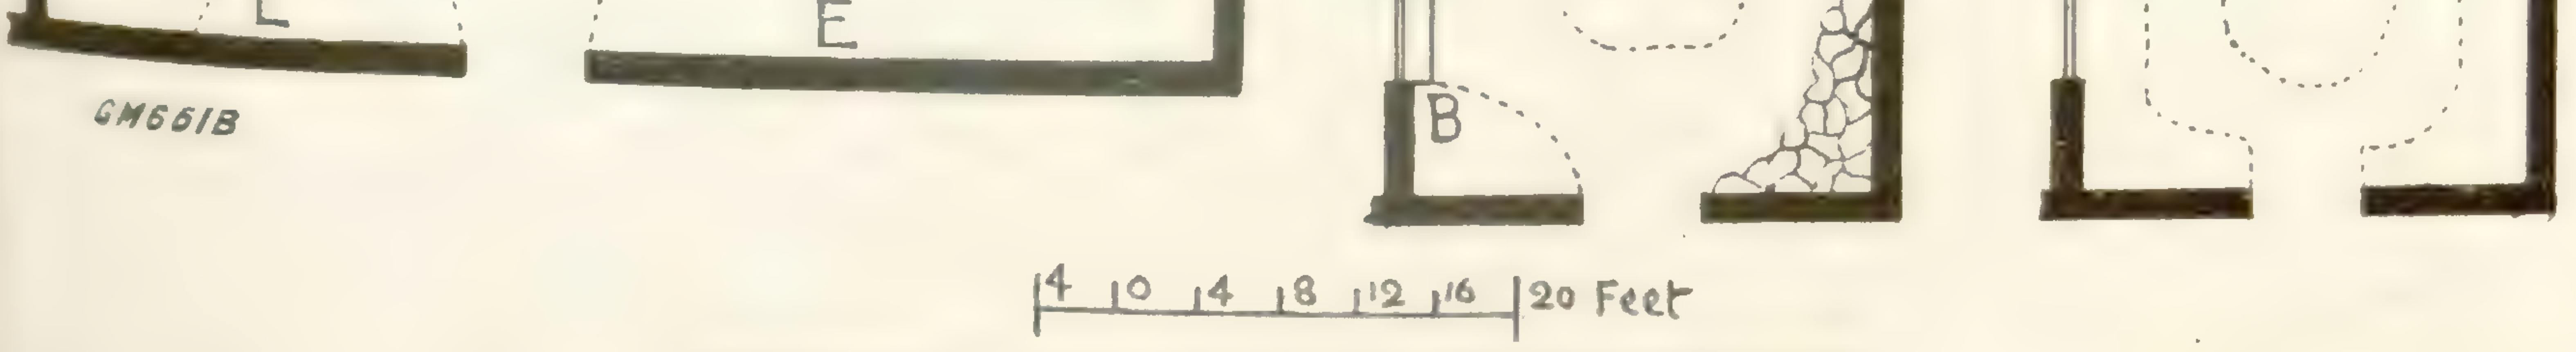
It is really in the arrangement of the plants that the conservatory is made or marred. Now the first and most obvious essential to the arrangement of plants is to possess them. The error of having a conservatory too large is far too general to be ignored. Unless a good supply of seasonable plants can be maintained, the idea of making a conservatory ever gay might as well be abandoned. Where there is always the work of picking over the plants to make them do again, the plants themselves present an exhausted appearance, the arrangement cannot be so natural, the power of artistically blending the colours is limited, and the one on whom devolves the work of arrangement loses all interest. No, the ideal conservatory must bear a proper proportion (in point of size) to the plant houses and to the means of the owner. On no other lines can an ideal conservatory be made or maintained, for if plants have to remain after they have passed the zenith of their glory, the conservatory loses its claim to be considered ideal.

I do not intend to wholly condemn the use of stagings for the display of plants. Such an arrangement is shown in Fig. 3, where a staging runs right round the house, and there is a central bed of rectilineal outline. I do, however, contend these stagings might at times be dispensed with, and other methods of arrangement adopted, such as are shown in Figs. 1 and 2. Let us for a while consider these.

In Fig. 1 (as also in 2 and 3), A is the drawing-room, with a window looking into the conservatory. The three shaded pieces at E are stagings on which comparatively small plants may be arranged. The spaces B, bounded by dotted lines, would be filled with palms and foliage and flowering plants arranged on the floor. C would be statues, the one being opposite the entrance and surrounded with plants, and the other



SUGGESTIONS FOR CONSERVATORY INTERIORS.



SUGGESTIONS FOR CONSERVATORY INTERIORS.

The approach to the conservatory should be made as pleasant as possible. Within the immediate precincts of the ideal conservatory I can imagine nothing better than a sweeping stretch of green sward, thus [illegible] that display of ignorance on the [illegible] those who would compare exotic [illegible] within with the more natural beauty [illegible]. The outer walls of the conservatory should be well clothed with creepers [illegible] by a belt of shrubs, and the [illegible] exterior should give promise of pleasure within and seem to invite and almost [illegible] entrance.

within view of the drawing-room window. In this method of arrangement practically the whole beauty of the conservatory could be viewed from the drawing-room. This may or may not be considered an advantage, but I certainly think it will be conceded that the method is somewhat superior to the prosaic arrangement of Fig. 3; or, at any rate, it makes a pleasant change. We have another pleasing arrangement in Fig. 2, where an oval group is formed on the floor, and is skirted by a border with a wavy outline. A recess is formed at F for a seat, and a statue would stand at C. E would be an arrangement of plants on a staging, and D would be a circular tiered stage, topped by a graceful palm. Given good plants and intelligence in setting them up, this could not, I venture to think, fail to please the most fastidious. Other arrangements are shown in Figs. 4 and 5, which are sufficiently clear to explain themselves.

Where stagings are still used it would, I think, be a distinct advantage, and a novel feature, to cover it first of all with grass for the pot plants to stand on. Shallow boxes made to fit the staging could be filled with soil and sown with lawn grass seed, and in due course cut. As a groundwork I think it would be distinctly pleasing. Then, again, the posts supporting the staging could be enclosed with wire-netting, and the space between the netting and the post plugged with turfy loam, peat, and moss, and planted with small, quick-growing ferns. Where a group is made on the floor a pleasing feature could be formed by putting a verge of grass (about a foot in width) all around it at the bottom, with the part near the pots slightly tilted. The space beneath the staging could also be furnished with some of the numerous plants which are partial to that position, or a rockery could be formed.

Another arrangement which merits trial is to form beds on the floor, made up of ashes or cocoanut-fibre and bounded by a bank of turf, and in these ashes to plunge such plants as Salvia splendens, Salvia patens, Coleus thyrsoideus, zonal pelargoniums, cyclamen, gloxinias, carnations, Begonias Gloire de Lorraine, tulips, hyacinths, and innumerable other plants. Such a feature could not fail to give pleasure. Then, again, I cannot see why the beautiful groups seen at shows, such as Shrewsbury, Hanley, Wolverhampton, and York, could not be imitated where space is available. In the arrangement I have shown in the plans there would be ample room for the modern mode of massing plants in their colours, and a pretty and gracefully undulating effect could be produced. In fact, the arrangement of plants in a conservatory is full of possibilities.

It goes without saying that the method of heating and ventilating the house would be modern and perfect. To obviate the difficulty of watering the baskets, each one could be kept in position by a weight so that they could be pulled down for watering.

In our ideal conservatory there would be perfect harmony of colours, relieved occasionally by sharp, but not displeasing contrasts, the fragrance emitted from leaf and flower would be pleasing without being oppressive, and by the frequent introduction of fresh plants to replace those which were waning, the beauty would be ever changing, ever new. The atmosphere of such a conservatory would be one of joy and peace—such joy and peace as are inseparably associated with the scent and sight of beautiful flowers.

William F. Rowles.

NOTES FROM KEW.

Though it is now a well-known fact, and one often deplored, that hard-wooded plants do not occupy the same position in popular favour that they once did, yet, at the present time, they serve to make a goodly show in the greenhoue at Kew. They are for the most part grouped together, and the representative collection now brought in association occupies considerable space.

Boronias.

The boronias are, of course, well represented, for, though the sober-tinted B. megastigma is nearly over, there are still enough flowers remaining to attract by reason of their delicious fragrance. The newer B. heterophylla, whose bright-coloured blossoms are closely packed for some distance along the shoots is, I think, entitled to rank as the showiest member of the genus, though when at its best, B. elatior runs it closely. As a rule, however, B. elatior is only expanding its earliest blossoms when B. heterophylla is at its best, so that where these plants are grown, a place may well be found for both of them. A species which is well grown at Kew, but rarely met with elsewhere, is B. fastigiata, of rather upright growth. The small ovate leaves are of a fleshy texture, and the blossoms, which are individually about half an inch in diameter, are borne in terminal heads. They are of a mauve-pink colour.

Heaths.

As might be expected, several members of the heath family (erica) contribute their share to the floral display, particularly noticeable among them being Erica canaliculata, with small mauve-coloured blossoms; E. persoluta alba, a popular kind, with flowers of much the same size, but pure white; E. ampullacea, with pleasing rosy-white flowers of a thick waxy texture; and the two popular market varieties, E. Cavendishi and E. Spenceriana. This last-named has a profusion of long-tubed flowers of a pinkish mauve colour, but varying in shade according to the conditions under which it has been grown. Erica Cavendishi is well known for its bushy habit, the deep green of its leafage, and the golden hue of its blossoms.

Epacris.

Of course, by the middle of May most of the epacris are over, but the distinct E. longiflora or miniata, as it is often called, is now at its best. It is of a loose, spreading habit of growth, while compared with the early flowering forms the blossoms are longer and drooping, and on the almost horizontally disposed shoots are seen to very great advantage. In colour they are bright red, tipped with white. The double-flowered E. purpurascens flore plena, better known as E. onosmæflora flore plena, whose little white rosette-like blossoms are closely packed for some distance along the shoots, is also in good condition. When first distributed (about 25 years ago) great anticipations as to its value for decoration were indulged in, but up to the present they have not been realised.

Leptospermum scoparium.

This exceedingly free-flowering member of the myrtle family, known popularly as Captain Cook's Tea Plant, presents quite a mass of its pretty white blossoms, and forms a pleasing feature in the greenhouse. It is of easy culture, and may be kept out of doors during the summer months.

Felicia echinata.

This is a freely-branched, yet upright growing composite, whose terminal flower heads consist of a yellow disk surrounded by mauve-coloured florets, making a bloom about 1½ inches across. The leaves are small, and of a deep green tint. It is decidedly uncommon, but well merits extended cultivation.

Cytisus fragrans.

This member of the broom family, which, under the name of Cytisus or Genista racemosa, is such a popular market plant [illegible] represented at Kew by two distinct varieties. The first, Everestianus, is characterised by flowers of a much richer [illegible] than those of the type, and the second—elegans—has leaves more or less silky, and pale yellow blossoms.

Platytheca galioides.

Known also as Tremandra verticillata and Tetratheca verticillata, this pret[illegible] little Australian shrub is quite distinct from any other occupant of the greenhouse. It forms a bushy little specimen, whose thin wiry shoots are clothed with very narrow leaves arranged in whorls of eight to [illegible]. The saucer-shaped flowers, which are of a beautiful shade of blue, are drooping and supported by long slender stalks. As [illegible] shoots lengthen more buds are developed, hence the flowering season extends over a lengthened period.

Aotus gracillima.

A very showy member of the Australian leguminosæ. The shoots of this are slender, a yard or more in length, and disposed in a graceful arching manner. The small pea-shaped blossoms, which are closely packed throughout the greater part of the length of the branches, are rich yellow, marked with scarlet. They are exceedingly pretty, but from their small size need close inspection.

K

Calceolaria Golden Glory.—A short time since I had an excellent opportunity of seeing in the Exeter nurseries [illegible] well that very fine hybrid calceolaria, Golden Glory, stands the winter in the open ground. The plants, Mr. Veitch informed [illegible] had been growing in the open ground [illegible] two winters; the plants were looking [illegible]markably well, and showed what might [illegible] done with this plant in the open ground. In fact, I am inclined to think the [illegible] ground treatment would suit it best, [illegible]viding a suitable position and favourable [illegible] were given it. It should not be thought that it will thrive best in Devon, as I saw it after two months of frost varying [illegible] gree from 5 deg. to over 20 deg., and at the time of my visit with snow falling. Many other plants would have been noted, but the wintry weather caused us to seek shelter.—[illegible] H. Slade.

Nemesias may be fittingly regarded as in the class of reliable annuals, and although rarities and novelties are experimented upon every year, to these is assigned a place won upon their merits as decorative garden plants. The flowers have many good qualities, being bright in colour, freely produced, and lasting in general effect, due largely to the succession of flowers which originate from the lateral branches. The plants are compact in growth, filling out into shapely bushy specimens; the habit is not too stiff, and, as many colours can be had in selected shades, for this reason nemesias are extremely useful for massing in beds and borders, and when employed as a groundwork to taller subjects the effect is all [illegible] desire. Nemesias amply repay a little extra trouble to secure an early display; [illegible] light soil in a cold frame, and transplanted, they may be placed in their flowering quarters early in May. Nine inches apart [illegible] good distance to plant, and provided the [illegible] is rich and light, failure is an [illegible] need scarcely be reckoned with. [illegible] the prettiest nemesias of recent introduction to gardens is a pale blue form which [illegible] gestive of spring forget-me-not [illegible] flower.—Thomas Smith.

THRIPS ON GARDEN PEAS.

(Concluded from page 385.)

Observations During the Past Season.

When the disease was first noticed, in July, and the peas were well advanced in growth, and it was unfortunately impossible to note the commencement of the attack. The diseased appearance of the pods above described was well established, and the larvæ were readily found. They were less than one-sixteenth of an inch long, orange-yellow in colour, except for the last two segments, which were black. The eyes, especially in the younger larvæ, were of a conspicuous red hue. They were fairly active, and were often seen wandering over the pod, but when feeding they were necessarily stationary, with their piercing jaws plunged into the vegetable tissue.

Nothing was to be learnt concerning the course of the disease from the older pods, so the flowers in all stages of development were carefully examined. Very few of the adult insects were seen at all, and still fewer were caught, for they were very active and flew away immediately on discovery. Such as were seen were in the flowers, and were nearly black in colour.

A great deal of search was necessary before the eggs were found, a large number of leaflets and flowers, old and young, being dissected and subjected to microscopic examination. At last they were found, and uniformly in the same situation. In examining the stamen sheaths of fully developed flowers, pairs of minute red specks attracted attention, and these turned out to be the eyes of tiny young larvæ protruding their heads from the surface of the sheath, in the substance of which the eggs from which they were hatching were buried. These little protruding heads with the already conspicuous eyes had a very quaint appearance, and the examination of a great many stamen-sheaths showed the larvæ in various stages of development and emergence. When their position was once discovered there was no difficulty in finding any number of examples, many stamen-sheaths showing twelve or more of the developing larvæ.

I am by no means sure that this is the only situation in which the eggs are deposited, but I entirely failed to find them anywhere else, though from the progress of the disease it seemed likely that some were laid in the very young shoots before the flowers were developed. At all events, the origin of the disease of the pods was clear enough. The female must crawl into the flower and pierce the stamen-sheath at intervals with her ovipositor, depositing an egg at each operation. While the larvæ are developing, so is the pod, and their future feeding ground is close at hand. When they emerge they have only to crawl on to the adjacent pod which they pierce with their jaws, extracting the sap and mottling the green surface with white patches, at first only at the base, but later at both ends where they find convenient shelter if disturbed. The pod soon looks unhealthy and becomes distorted.

Treatment.

It is very evident from the nature of the disease that it is most important to notice the commencement of the attack and deal with it then. The date when it was first observed made this impossible last season, so that observations of the early stages must be deferred till next year, when pea-plants will be kept under observation from their first appearance above ground. All that is possible at present is to state any facts bearing on the origin of the disease, and any measures which are useful in mitigating its ill effects.

Where do the insects come from? Is the soil where diseased peas have been grown a danger to next year's plants?

Now the thrips do not pass the winter in the larval state, but as mature insects, which usually do not live under the soil but are found, if at all, in flowers or under the bark of trees. During attack I never found the larvæ on the roots of infested peas, and even if they could live there very few roots of the old crop are in the ground at the time the seeds are sown in the ordinary course of pea cultivation. It would seem that the only possible direct connection between two attacks would be in the use of pea-sticks a second time with the thrips concealed under the bark. During November I searched for them in such situations and found two or three species of thrips, but I am not aware that the disease only declares itself after sticking. The attacks are probably not directly connected at all, but arrive quite from the outside, in which case preventive measures would be useless. The insect is obviously common and widely distributed, whether or not the species is really Thrips cerealium. This point requires further investigation, as the larva of that species is described as yellow, without any mention of the black terminal segments. The best hope lies in the discovery of some treatment which shall check it when it first begins to attack the peas.

On the already diseased plants various washes were tried with very slight success. Paraffin emulsions did not reach any large proportion of the insects, which were too well hidden. Arsenic washes were hardly indicated in the case of sucking insects, but they were tried, with no very beneficial result. In some varieties of pea, moreover, the pods would not receive a uniform deposit of the spray, and remained largely unaffected by it.

Distinct improvement, however, resulted from topping the plants, just as beans are topped when suffering from aphis. The topmost shoots seemed to be the main seat of the attack, and the disease was certainly mitigated by their removal. In some cases badly diseased plants so treated put forth a late crop of perfectly clean pods.

RED OR GRIZZLY GRAPES.

I can assure Mr. Curtis that what I saw on p. 502 of the R.H.S. "Journal" relating to grizzly grapes does not influence me in the slightest degree, for two reasons: First, because I do not know who the writer of that note is, and whether he has the opportunity of gauging the opinion of those interested in the subject from a practical point of view; and, secondly, because some part of that note is distinctly in favour of my argument. What could be more conclusive of this than the opening note in reference to the variety Prince of Wales? Here we have a variety that is probably the most showy of any grape, in bunch, berry, and colour when in their natural condition, and possessing the highest flavour any grape can command. This variety is recommended most strongly in preference to any other variety, "Grizzly" not even excepted.

Referring to Grizzly Frontignan, I noted too, on p. 502, which Mr. Curtis quotes freely, "now seldom met with." Does not this prove that grape growers require something more than mere flavour, viz., appearance in colour, especially when they can combine quality and flavour, as in the case of Prince of Wales?

Reference is also made to Lady Hastings, a grape that cannot be excelled for flavour, and has the merit of growing freely, and of not being fastidious. It is a strong assistance to my argument that grapes equal, or superior in point of flavour, plus the enhanced appearance—colour—can be, and are, obtained quite as easily as growing these grizzly varieties only noted for flavour.

E. Molyneux.

Cabbage Early Offenham.—Although not a new variety, this cabbage has done remarkably well this spring, when many other varieties have suffered severely from the severity of the winter. Sown the third week in July, planted out twelve inches apart, there is scarcely a miss in a plot containing over one thousand plants. The hearts are close, green, and of capital flavour; it is a cabbage to recommend to those who require this vegetable in quantity during the month of April.—E. M.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

PERMANENT SHADING should now be put on the roofs of the houses where required. I would recommend that all span-roofed odontoglossum or other cool orchid houses should have a coating of permanent shading, which may either be put on with a whitewash brush or syringed with a fine spraying syringe. Houses with south or west aspects should also be permanently shaded where they contain cool orchids or such kinds as do not require an abundance of light. It is far better to prevent the foliage becoming too much ripened or of a bronzy-red colour at this season of the year, for it invariably happens that when plants become bronzed there is a considerable loss of foliage, and, consequently, leafless pseudobulbs, a condition that does not add to the appearance of the plants. Where permanent shade is used on the warmer divisions it enables the blinds to be removed early in the evening, thereby a considerable benefit is afforded in the matter of obtaining light, which has a much greater obstruction when the blinds are drawn.

DAMPING AND SPRAYING.—With the warmer and longer days damping will have to be done more frequently; it is difficult to lay down hard and fast rules as to how frequently damping down should be done, because the various situations and conditions under which the plants have to be grown are so varied that cultivators must be guided by their own discretion. Where the conditions are bright, and at a reasonable altitude, it will be found necessary to damp the houses, especially the warm ones, two or three times a day. We usually damp about 7 a.m., again about 12, and at closing time, say, about 4 o'clock, or a little before, in the afternoon.

SYRINGING AND SPRAYING.—When the conditions outside are favourable dendrobiums and such-like plants may be freely syringed overhead in the morning and again at closing time. Cattleyas and their allied genera should be sprayed daily when out of flower, but spraying should be done sufficiently early in the day to permit the foliage to become dry before the cool night temperatures are reached. The Mexican lælias and other light-loving plants should be syringed at frequent intervals. The odontoglossums we syringe overhead whenever the conditions are favourable outside. This is best done in the morning, as with the frequent dampings the conditions are not so drying as in the warmer divisions.

VENTILATION.—One of the greatest difficulties I find is to induce the young men to ventilate according to the prevailing outside conditions. With us the present spring has been a remarkable one, although the sun has been very strong during the greater part of the day the prevailing winds have been cold and piercing, and such as to cause much anxiety, especially when the blinds are brought into use. If proper care is not observed, and the ventilation reduced when the blinds are brought into use, there is a rapid fall in the temperature, which is anything but beneficial to plants in an active state of growth. Direct draughts must also be avoided; there is nothing more detrimental than the outside air coming in direct contact with the plants, so that every care is necessary to minimise these dangers at all times.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

REARRANGEMENT.—As most of the bedding plants and others that are required for the embellishment of the lawns and terraces have been removed from the houses, we shall be able to give the permanent occupants considerably more room, and the present will be a very convenient opportunity of giving all the stages a good cleansing. As the rearrangement proceeds all the plants that require it may be given a little artificial manure, sprinkling it carefully over the surface of the soil without putting it too near to the stems of the plants. This is really a better method of applying artificial manure than by giving it in the water, as any plant that does not require it may be passed over; but if given in water it is often a trouble to water some with liquid manure and others with clean water. Endeavour to keep all plants together in one house or pit that require shade, and thus save time.

CANNAS.—These, if treated as advised in March, should now be nicely established in 54's or 48's, and be ready for shifting into their flowering pots (32's). A rich compost should be used, and potting done very firmly. All side growths should be rubbed out as they appear, keeping to one shoot in a pot, and if they are well fed after they are established finely developed spikes of bloom will result. The house in which these plants are kept should be frequently fumigated, as green-fly is apt to be troublesome on the young leaves.

ZONAL PELARGONIUMS that are intended for winter blooming should now be ready for transferring into 32's, and should be given the protection of an unheated frame until nicely rooted, when they may be removed into the open air, and given all the sun and light possible. Plants that are coming into bloom should be encouraged with a little feeding, and a light shade during the middle of the day will help the colour of the blooms.

SHOW, FANCY, AND REGAL PELARGONIUMS should now be making a brave show, and a dry, airy house should be devoted to them. Carefully remove all dead blooms, especially if the weather be dull and wet, but if this is regularly attended to they ought to continue bright for a few weeks longer.

COLEUS.—Where there is a demand for plants in small pots these may still be propagated, and the earlier-rooted examples, if required of large size, should be shifted into 9 or 12 inch pots, keeping them pinched into whatever shape they may be required.

SWEET PEAS that are now blooming in pots should receive copious waterings of liquid manure, and if they are not allowed to become dry they ought to give plenty of bloom till those grown outside come into flower.

PRIMULAS.—Seed of these should be sown, also a small sowing of cinerarias, to be followed by another sowing in two or three weeks' time. It is not advisable to raise either of these plants very early, as by sowing early they come into flower at a time when they are not wanted.—Thomas Stevenson, Woburn Place Gardens, Addlestone.

THE FLOWER GARDEN.

SUMMER BEDDING.—Except in the more northern districts it is generally considered safe to commence putting out the various kinds of plants suited for summer bedding after the 21st of the present month, naturally commencing with those which are known to be the most hardy. But where spring bedding is carried out, the work will be deferred owing to the lateness of the season for a week later than is generally the case. The first consideration will be the preserving and propagating of many of the spring-flowering plants which will be required for another year. The magnificent hybrid polyanthus, which have been so finely developed during recent years, are well suited for this branch of gardening, whether mixed or arranged in colours. Two-year-old plants make the finest display; consequently those which were raised from seed sown last spring should be taken care of and planted out pretty thickly together on fairly good ground, in a rather shady part of the garden. Take care to mark and save seed from the very best varieties. Arabis albida fl. pl., too, should be taken care of, parted up, and planted out firmly in a shady position, when it will root freely; and anything else that may be required for the same purpose. After the beds are cleared, apply a thorough dressing of good farmyard manure; dig deeply, or, better still, trench to a depth of two feet, and if the beds can be allowed to remain for a day or two before planting, so much the better, when these should be made very firm by treading, and raked level. Plant firmly, give a good watering in, and all large plants should be thoroughly secured with good stakes.

THE SHRUBBERIES.—One will now be able to determine to what extent many of our more beautiful trees and shrubs have been damaged during the past winter. I fear that in many cases an irreparable amount of mischief has been done, and especially where means were not taken to afford them some kind of protection. These should be carefully looked over now and the damaged parts taken off; and, where there is any sign of life, the plants will stand a much better chance by severely pruning them back, though in many cases it may be quite to the ground. It is very strange how some things which one might have considered perfectly hardy have suffered with us; while others, which one would not have been surprised at if they had been killed outright, have escaped. For instance, the well-known Berberis Wallichiana; in many cases large plants have been killed right to the ground, and all more or less have suffered, while olearias and veronicas have come through quite unharmed. The ground should be thoroughly hoed, the necessary staking carried out, and newly-planted trees damped overhead in the afternoon.

CLIMBERS.—These, whether growing on pergolas, tripods, buildings, or any other support, will need attention about every week or ten days at this season of the year, or the growths of the fast-growing plants will become so entangled that it will be a difficult matter to separate and arrange them satisfactorily. All roses should be thoroughly syringed with a reliable insecticide, both as a cure and a preventive for aphis.

SEED SOWING.—There are several kinds of seeds which should be sown now on a shady border for flowering next spring. These are wallflowers of sorts, myosotis of sorts, to include Royal Blue, polyanthus, and anemones.

RHODODENDRONS.—These should be thoroughly mulched, either with good peat, leaf-soil, and sand, or good half-decayed cow manure, and thoroughly water if dry weather continues.—E. Beckett, Aldenham House Gardens.

HARDY FRUITS.

FRUIT PROSPECTS this season are exceptionally good, every kind and variety which has already flowered has been literally covered with blossoms, while apples, strawberries, raspberries, etc., appear equally as promising.

INSECTS often become troublesome at this season when the fruit is set, and the young foliage is unfolding itself. Prompt measures should be taken with aphides before they have time to protect themselves by curling up the leaves, or the caterpillars before they defoliate the trees. A safe insecticide should be used to destroy the former, while for the latter I find nothing so satisfactory as the arsenate of soda wash. To make this emulsion, dissolve one ounce of arsenate of soda in a little warm water and pour it into a vessel containing ten gallons of soft water, afterwards dissolving three ounces of acetate of lead, adding this to the former, with one pound of treacle, well stir the whole, and it is ready for use. The adhesiveness of the emulsion to the foliage is largely supplemented by the addition of the treacle to the wash. This emulsion may be used as soon as the young fruits are set, without any damage to these or the foliage.

PEAR MIDGE.—Trees on which there were signs of this pest last season should be closely examined as soon as the fruit is well set, and every fruit seen to be infested should be picked off and destroyed by burning.

WATERING.—The rainfall for April in this district registered only 1.35in., while the bright sun and drying winds which we have been experiencing of late have dried up the soil very much. All young trees that were planted during the past season should have a good watering, and, if not already mulched with manure, let this be done immediately afterwards, to assist in conserving the moisture in the soil among the young roots. The borders by walls will in many instances also be found deficient in moisture; where this is so, give the soil about each tree a thorough soaking. Much fruit may be cast off if the trees suffer from dryness at the roots.

WALL TREES.—As the young shoots that have been reserved for laying in become sufficiently long to tie in, let them be carefully fastened to the wall in their proper positions. Use broad strands of raffia if the walls are wired; but, whether using this or nails and shreds, allow plenty of room for the natural swelling up of the young growths.

STRAWBERRIES.—Remove all flower trusses from the young plants that are required for furnishing the early runners for next year's fruiting. If the weather should continue at all dry, it will greatly assist the plants in producing strong runners if they are given occasional waterings with weak liquid manure; also a slight mulching of well-decomposed manure placed round each plant. Harden off and bed out as soon as ready the plants that have been forced, planting them firmly, and keep the crowns level with the surrounding soil. Well water them in their new positions, and mulch the surface with some good manure. Plants in the fruiting beds will be assisted in swelling up their fruits by a few waterings with liquid manure, being careful to keep it from the fruit and foliage. Netting should be provided and placed over the fruiting quarters as soon as the fruits show signs of colouring, or much damage will be wrought by the birds. It is more convenient, when gathering the fruits, if the netting is supported about four feet from the ground by some stakes and thin galvanised wire or cord.—George Woodgate, Rolleston Hall Gardens.

Gesnera cardinalis.—This differs considerably from most of the hybrid gesneras in forming a firm, solid tuber, whereas they generally make a kind of scaly underground rhizome. The season of blooming, too, does not correspond, for Gesnera cardinalis flowers usually in the spring and early summer months, whereas the hybrid forms are, as a rule, at their best later in the season. A synonym of G. cardinalis is G. macrantha, under which latter name it is often met with. Though it has been known in gardens for nearly sixty years, its native country seems to be unknown, though there is little doubt that it came originally from some part of South America. In a warm house it forms a bright and ornamental feature, as, apart from the flowers, the leafage is decidedly striking. From the firm, solid tuber aforesaid it pushes up a stout stem that reaches a height of a foot or thereabouts. This is furnished with large, ovate, oppositely arranged leaves of a bright green colour, and so thickly covered with hairs as to give them quite a velvety appearance. The flowers, borne in a terminal head, are tubular in shape, about a couple of inches long, and of a bright vermilion tint. Like the leaves, these are densely clothed with hairs, which form a very notable feature. This gesnera is of easy cultivation, as it is during the winter quite dormant, then grows and flowers in the spring or early summer, after which it gradually goes to rest. Its season of blooming may, however, be changed somewhat by varying the length of time during which it is, when dormant, kept quite dry. To start the tubers, shake quite clear of the old soil, and repot in a mixture of loam, leaf-mould, and sand.—W. T.

CHESTERFIELD HORTICULTURAL SHOW, QUEEN'S PARK, 28th July, 1909.
[illegible] Marquee for Roses. Numerous attractions.
Schedules on application to
CHAS. WM. HADFIELD, Secretary.

GRAND YORKSHIRE GALA.
June 16th, 17th, and 18th, 1909.
£800 OFFERED IN PRIZES.
[illegible] for Orchids, Stove and Greenhouse Plants.
[illegible] for Pelargoniums, Carnations, Begonias, etc
[illegible] for Roses, Cut Flowers, etc.
[illegible] for Fruit and Vegetables.
[illegible] GOLD MEDALS FOR TRADE EXHIBITS
Entries close 9th June. For Schedules apply to
FRED AREY, Secretary.
Davyhall Chambers, York.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

Notwithstanding that the great Temple show was but a week ahead, there was a particularly fine display on May 18 at the Royal Horticultural Hall. The hall and annexes were filled, and all the committees had to meet upstairs in the smaller rooms. Tulips were a brilliant and striking feature, and these, with the roses, provided the chief attraction.

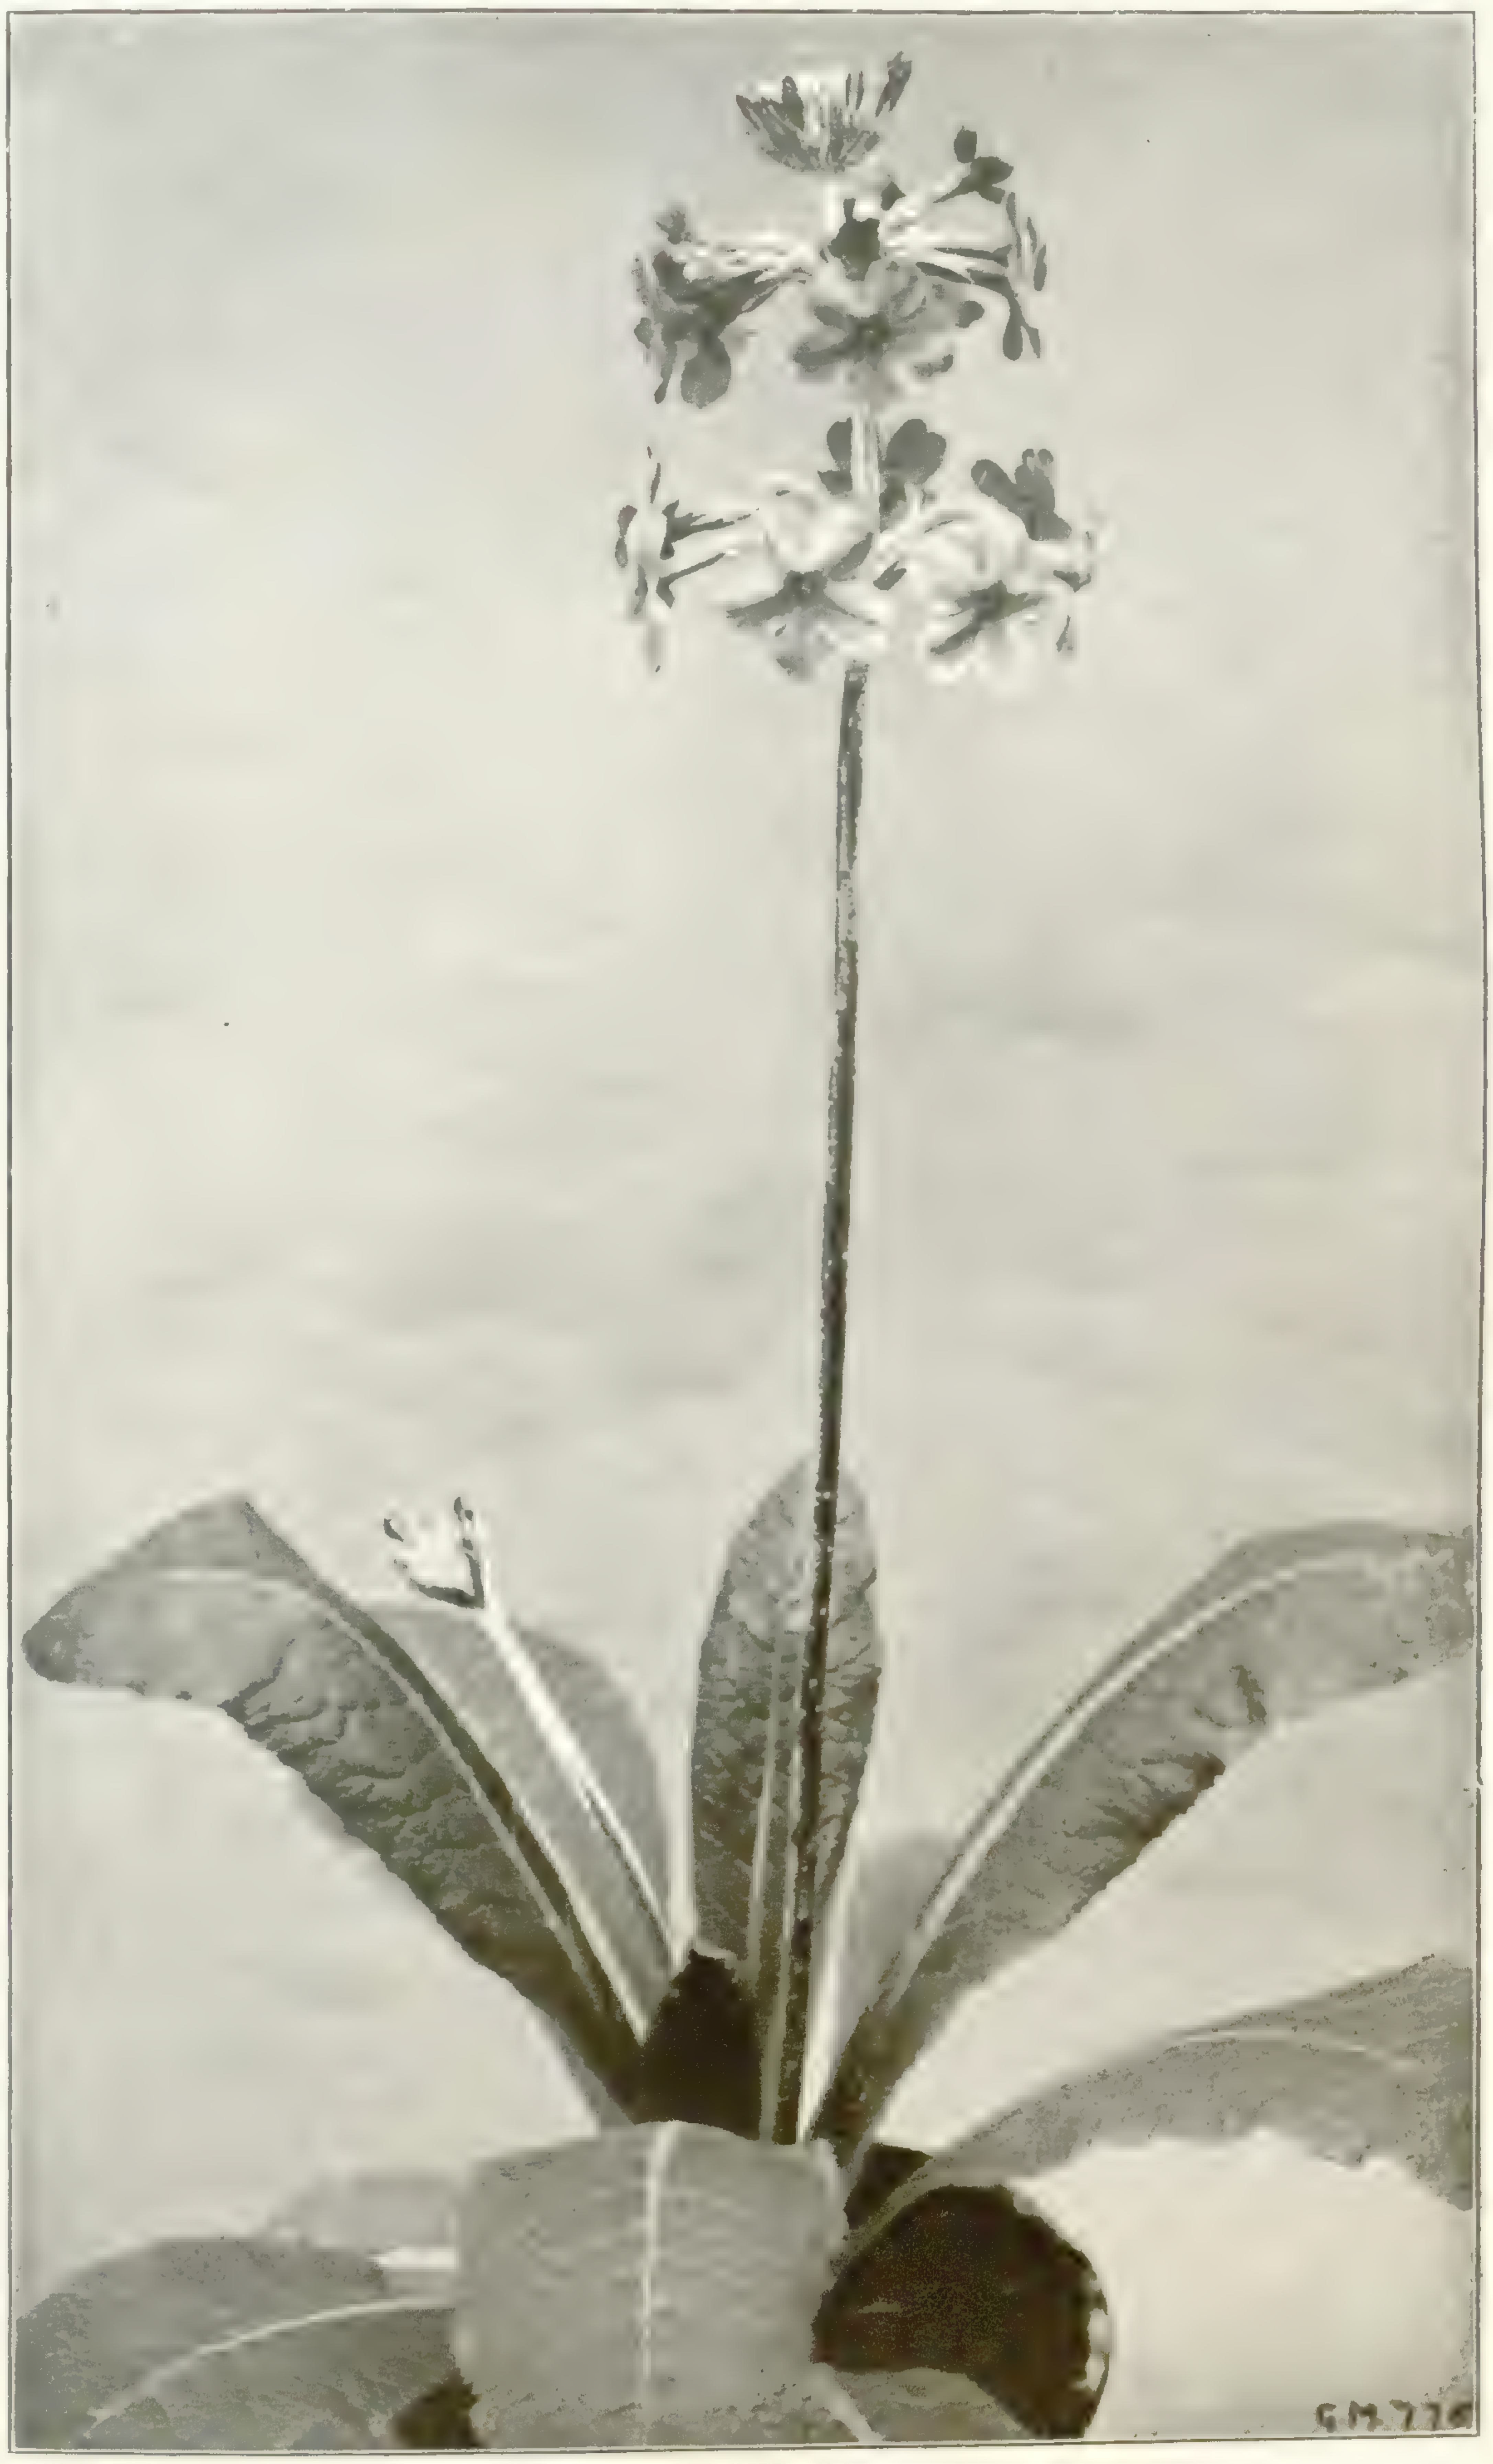
FLORAL COMMITTEE.

Early-flowering shrubs were well displayed by Messrs. J. Cheal and Sons, Crawley, whose vases of Pyrus Scheideckeriana, Kerria japonica, Daphne oleoides, Rhododendron Pink Pearl, and the lovely Exochorda grandiflora, the latter a perfect picture, smothered with white blooms, produced a bright and pleasing display of colour. In Messrs. Hugh Low and Co.'s group the main features were the finely-grown plants of Metrosideros floribundus, blue hydrangeas, schizanthuses, the graceful Aotus gracillima, carnations, and roses. Mr. R. Sydenham, Birmingham, contributed a few bunches of sweet peas, showing The King, H. Eckford, Evelyn Hemus, Etta Dyke, etc. Miss Willmott, V.M.H., Warley Place, Great Warley, showed Cheiranthus Allioni hybrida, a neat and fragrant wallflower. Mr. L. R. Russell, Richmond, sent a prostrate form of Cytisus Andreanus. Mr. Charles Turner, Slough, displayed numerous varieties of Primula Sieboldi, etc.

The group of roses from Messrs. Frank Cant and Co., Braiswick, Colchester, contained some beautiful weeping standards of Dorothy Perkins and a grand lot of cut blooms of the exquisite Marechal Niel. Androsace Chumbyi, Globularia vulgaris, Gentiana acaulis, and Cheiranthus Allioni were delightful gems in a collection of alpines submitted by Messrs. T. S. Ware, Lim., Feltham. The two beautiful new annual chrysanthemums, Morning Star and Lord Beaconsfield, were both largely and splendidly shown, as grown in pots for conservatory decoration by Mr. C. Anderson, gardener to Mrs. Bischoffsheim, South Audley Street, W. Messrs J. Peed and Son, West Norwood, sent [illegible], alpines, and succulent plants.

A magnificent bank of pot-grown roses, arranged by Messrs. T. Rochford and Sons, Turnford Hall Nurseries, opposite the entrance of the hall, was the attraction of the day. [illegible] a very large exhibit, and a high one, [illegible] by palms. There were grand standards of Dorothy Perkins, Lady Gay, and [illegible] Rambler, and great bushes and tall [illegible] of Mrs. F. W. Flight, Wedding Bells, [illegible] Crimson Rambler, Blush [illegible], and Lady Gay. This was a superb [illegible] was a great attraction, and de[illegible]. The firm also showed the Lyon [illegible] Perpetual carnations, forced wistarias, and Azalea mollis, made up a large exhibit from Messrs. W. Cuthbush and Son, Highgate.

[illegible] splendid rhododendrons were exhibited by Messrs. J. Waterer and Sons, Bagshot, and the lovely lilac-pink variety Mrs. C. Stirling was the variety most shown. A few of the newer roses, as well as the old [illegible] Banksian, were exhibited by Messrs. [illegible] and Son, Cheshunt, who also showed vases of choice flowering shrubs. Messrs. G. and A. Clark, Dover, contributed a gay group of tulips, trollius, phloxes, anemones, etc. Messrs. W. H. Rogers and Son, Red Lodge Nursery, Southampton, submitted the bright semi-double pelargonium James T. Hamilton, a very attractive form. Mr. H. Hemsley, Crawley, exhibited alpines and dwarf shrubs, arranged on and among rocks of the celebrated Hackenden sandstone, a particularly good material for rock gardens.



PRIMULA BULLEYANA.
A handsome hardy species, introduced from Western China, and exhibited by Messrs. Bees, Lim., at the Royal Horticultural Society's Meeting on Tuesday last, when a First-Class Certificate was conferred upon it. The flowers are produced in whorls, and are of a rich golden colour, suffused on the outer side with orange.

Calceolaria Profusa (provisional name), a very free-flowering greenhouse plant, bearing a profusion of golden-yellow blooms on much-branched growths, was finely shown by Mr. F. Townsend, gardener to L. Sutton, Esq., Hill Rise, Reading. The origin of this plant appears to be somewhat obscure, but there is no question as to its usefulness for the conservatory. Scented-leaved pelargoniums, as well as a collection of show and regal varieties, were set up by Messrs. Heath and Son, Cheltenham, who also displayed alpine plants in a miniature rock garden. A very beautiful lot of high-class pansies and violas from Messrs. Dobbie and Co., Rothesay, formed a great attraction, as also did the new sweet peas, Masterpiece, Edrom Beauty, Earl Spencer, Mrs. Bell, Mrs. Andrew Ireland, and The King.

Mr. G. Reuthe, Keston, Kent, had many interesting things, notably Embothrium coccineum, Primula pulverulenta, Arnebia echioides, alpine and show auriculas, fine Himalayan rhododendrons, and a small collection of late tulips. Among the roses shown by Messrs. B. Cant and Sons, Colchester, the chief were Hiawatha, Austrian Copper, and Austrian Yellow, Black Rambler, Tausendschon, Mrs. F. W. Flight, and Frau Karl Druschki. Very interesting was the collection of early flowers, all from out of doors, brought up by Mr. W. A. Cook, gardener to Sir Edmund Loder, Bart., Leonardslea, Horsham. The rhododendrons were especially good, and included R. Coombe Royal, R. Blandfordianum, R. cinnabarina, and R. Dalhousie-Victorianum: other fine subjects were Rubus deliciosus, Ranunculus amplexicaulis, Magnolia Lennei, Japanese maples, and the golden Caltha polypetala.

Mr. Amos Perry, Enfield, arranged a very bright collection of hardy flowers, setting up Dodecatheon splendens, Phlox canadensis Perry's var., Lupinus Nootkatensis, Camassia Cusicki, Corydalis nobilis, Weigela præcox, Lithospermum prostratum Heavenly Blue, and Moutan pæonies in variety, with tulips and onco-regelia irises. Some good roses were exhibited by Mr. G. Mount, Canterbury, his leading varieties being Liberty, Mdme. Ravary, Caroline Testout, Mdme. Abel Chatenay, Mdme. Jules Gravereaux, and Richmond. Among several rare shrubs Messrs. Jas. Veitch and Sons, Chelsea, submitted a dwarf and beautiful rhododendron with large rosy-red shaded flowers, named R. Soulei. (F.C.C.).

Mons. H. Correvon, Geneva, showed a tiny group of alpine plants. Messrs. G. Bunyard and Co., Maidstone, contributed well-grown tulips, and a large collection of hardy flowers, flowering shrubs, and the new pink spiræas. Double and single zonal pelargoniums, verbenas in variety, the useful Pelargonium Clorinda, and a very interesting group of varieties of Hartstongue ferns were arranged by Messrs. H. B. May and Sons, Edmonton. Fragrant sweet peas were exhibited by Mr. E. J. Johnstone, Burr's Wood, Groombridge, who showed popular varieties. The fine corner group of roses in pots from Messrs. Wm. Paul and Son, Waltham Cross, did not lack admirers. Standard and pillar plants were extensively displayed, and were finely flowered; Rubin, Elsie, Coquina, Kathleen, Paradise, and Grace Thomson were the leading varieties.

Messrs. Bees, Lim., Liverpool, showed some more new primulas, i.e., P. Bulleyana (F.C.C.), with rich golden blooms on erect spikes, and P. Lichingensis, with deep purple flowers. The large-flowered Incarvillea Bonvaloti and the tiny Primula muscarioides were other interesting plants shown by the Messrs. Bees. Pelargoniums and phyllocacti were extensively displayed by Messrs. H. Cannell and Sons, Swanley, and the same firm had huge blooms of the novel Aristolochia gigas Sturtevanti. A remarkably fine series of varieties of Scilla campanulata was shown by Mr. Maurice Prichard, Christchurch, Hants, whose collection of hardy flowers also included anemones, trollius, phloxes, and hardy orchids. Messrs. Whitelegge and Page, Chislehurst, put up a small collection of alpines. Messrs. Bakers, Wolverhampton, had a fine set of saxifrages, such as S. R. W. Hosier, S. Miss Willmott (A.M.), S. Lady Dean, a large-flowered white, S. Codsall Cream, S. Guildford Seedling, and S. Arkwrighti—all very attractive and beautiful.

ORCHID COMMITTEE.

Orchids were very sparingly shown, and difficult to find. Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester, showed an Odontoglossum Pescatorei with a spike of 125 flowers, the handsome Lælio-cattleya Zoreaster Rex, and Cymbidium Parishi Sanderæ. De Barri Crawshay, Esq., Rosefield, Sevenoaks, contributed Odontioda Vuylstekæ Crawshayana (F.C.C.), a brilliant orchid.

A large group of Lælia purpurata, submitted by Mr. Howard, gardener to H. Little, Esq., Baronshalt, Twickenham, demonstrated the variableness of this species and the wealth of Mr. Little's collection.

TULIP COMMITTEE.

Across the end of the hall Messrs. R. and G. Cuthbert, Southgate, arranged a very large collection of Darwin and May-flowering tulips, grown in pots. The display was most artistically arranged on a very low staging, and some groups of varieties were arranged higher than the rest. White Queen, La Tulip Noir, Salmon Queen, Ada, Mrs. Moon, Painted Lady, Lord Curzon, Pompadour, Lucifer, and Suzon were especially attractive varieties. A very bright exhibit of late tulips came from Messrs. Jas. Veitch and Sons, Chelsea; all the flowers were clean and bright, notably those of Inglescombe Yellow, Gesneriana lutea, Queen of Roses, Picotee, Bouton d'Or, Suzon, Mrs. Moon, Rev. W. Ewbank, Mrs. Krelage, and Yellow Picotee. The Rev. Canon Fowler, Earley Vicarage, Reading, contributed a small collection of well-grown Darwin and May-flowering tulips.

Magnificent tulips were grouped by Messrs. A. Dickson and Sons, Newtownards, Ireland, and the display included wonderfully large and brilliant blooms of Prof. M. Foster, Duke of Westminster, May Queen, Bouton d'Or, Inglescombe Pink, Gold Vase, Nauticus, Marie, Mr. Farncombe Sanders, Margaret, Pride of Haarlem, and Ravenswing. Mr. A. Allan, gardener to Lord Hillingdon, Hillingdon Court, Uxbridge, showed a few finely-developed late tulips, over bunches of lily of the valley Messrs. Wm. Bull and Sons, Chelsea, contributed a collection of bright tulips.

A bold and brilliant exhibit of tulips, arranged rather low on the stage, by Messrs. Hogg and Robertson, Mary Street, Dublin, was a great success. It included Zomerschoon, Chameleon, Gesneriana lutea, Turenne, Garibaldi, Gala Beauty, and other fine things. Another fine display of tulips was made by Messrs. R. H. Bath, Lim., Wisbech, who had very good flowers of Yellow Queen, Ada, Salmon King, Europe, Gustave Doré, Tak van Poortvliet, Bouton d'Or, Mrs. Moon, Fashion, and White Queen. A wonderfully fine bank of cut tulips from Messrs. R. Wallace and Co., Colchester, was a centre of attraction all the day. There were any quantity of fine flowers, and of such beautiful varieties as Mrs. Moon, Leghorn Bonnet, Inglescombe Pink, Inglescombe Yellow, Loveliness, Psyche, The President (A.M.), Fra Angelica, Inglescombe Scarlet, Millais, Red Standard, and several fine new seedlings.

Tulips were remarkably well shown by Messrs. Sutton and Sons, Reading, who displayed fine flowers of the best May-flowering varieties in a very pleasing manner, and avoided the error of overcrowding. An excellent display of Darwin, May-flowering, and florists' tulips was made by Messrs. Barr and Sons, Covent Garden, who had fine flowers of a great number of varieties, and among the many we made special note of Inglescombe Yellow, Zulu, Margaret, Violet King, the lovely Walter T. Ware, Queen Alexandra, and Gala Beauty.

FRUIT AND VEGETABLE COMMITTEE.

Messrs. Sutton and Sons, Reading, were represented by a very interesting exhibit of Flower of Spring and Sutton's April cabbages, excellent Golden Ball and other lettuces, a fine lot of Early Giant and Ideal peas, radishes, very crisp, the Sutton rhubarb, asparagus, and carrots. It was a fine collection of early vegetables and salading. Messrs. Jas. Veitch and Sons, Chelsea, displayed early vegetables and salading, their long turnips, radishes, Veitch's Model broccoli, carrots, Moore's Cream marrows, lettuces, and cabbages attracting a great deal of attention.

Mr. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Elstree, was awarded first prize for a collection of nine kinds of vegetables, and he staged splendid samples of asparagus, Moore's Cream marrows, Perfection tomatoes, Canadian Wonder beans, Matchless cucumbers, Magnum Bonum cauliflowers, Early Giant peas, and May Queen potatoes. Second prizes were awarded to Mr. Staward, gardener to Countess Cowper, Panshanger, Herts, for nine kinds, and Mr. A. G. Gentle, gardener to Mrs. Denison, Little Gaddesden, Berkhamsted, for four kinds. Mr. Staward also showed a collection of lettuces.

Mr. J. W. Barks, gardener to P. Brandt, Esq., Bletchingley, Surrey, submitted dishes of Royal Sovereign strawberries, Alexander peaches, and Hero of Lockinge melons. From the Stour Valley Gardening Society, Westbere, Canterbury, came excellent cos and cabbage lettuces, mushrooms, etc.

A very free cropping strawberry, named George Monro, said to be excellent for forcing, and a very early fruiter out of doors, was shown by Mr. H. Staples, Swanley, and gained an A.M.

CERTIFICATES AND AWARDS.

First-Class Certificate:

To Rhododendron Soulei, from Messrs. Jas. Veitch and Sons, Chelsea.

To Primula Bulleyana, from Messrs. Bees, Lim., Liverpool.

To Odontioda Vuylstekeæ Crawshayana, from De Barri Crawshay, Esq., Rosefield, Sevenoaks.

Award of Merit:

To May-flowering Tulip The President, from Messrs. R. Wallace and Co., Colchester.

To Rose Lyon, from Messrs. T. Rochford and Sons, Turnford Hall, Broxbourne.

To Saxifraga decipiens Miss Willmott, from Messrs. Bakers, Codsall, Wolverhampton.

To Strawberry George Monro, from Mr. H. Staples, Swanley.

MEDALS.

Gold.—To Messrs. T. Rochford and Sons, Broxbourne, for roses in pots.

Silver-Gilt Flora.—To Messrs. Sutton and Sons, Reading, for tulips; to Messrs. Barr and Sons, Covent Garden, for tulips; Messrs. R. and G. Cuthbert, Southgate, for tulips in pots; to Messrs. A. Dickson and Sons, Newtownards, for tulips; to Messrs. R. Wallace and Co., Colchester, for tulips.

Silver-Gilt Knightian.—To Messrs. Sutton and Sons, Reading, for early vegetables and salads.

Silver-Gilt Banksian.—To Messrs. Jas. Veitch and Sons, Chelsea, for tulips; to Messrs. R. H. Bath, Lim., Wisbech, for tulips.

Silver Flora.—To Messrs. H. B. May and Sons, Edmonton, for hardy ferns, etc.; to Mr. G. Mount, Canterbury, for roses; to Mr. G. Reuthe, Keston, for hardy plants; to Messrs. Hogg and Robertson, Dublin, for tulips; to M. Correvon, Geneva, for alpines; to H. Little, Esq., Baronshalt, Twickenham, for lælias.

Silver Knightian.—To Messrs. J. Veitch and Sons, Chelsea, for vegetables and salads; to P. Brandt, Esq., Bletchingley, for fruit.

Silver Banksian.—To Lord Hillingdon, Uxbridge, for tulips; to Rev. Canon Fowler, Earley, Reading, for tulips; to Messrs. Wm. Bull and Sons, Chelsea, for tulips; to Messrs. G. Bunyard and Co., Maidstone, for hardy flowers; to Messrs. J. Cheal and Sons, Crawley, for flowering shrubs; to Sir Edmund Loder, Bart., Leonardslea, Horsham, for choice hardy flowers; to Messrs. W. Cutbush and Son, Highgate, for carnations and flowering shrubs; to Messrs. Dobbie and Co., Rothesay, for violas and sweet peas; to Messrs. Hugh Low and Co., Enfield, for roses and carnations; to Messrs. Wm. Paul and Son, Waltham Cross, for roses in pots; to Mr. Maurice Prichard, Christchurch, for hardy flowers; to Messrs. T. S. Ware, Lim., Feltham, for alpines; to Messrs. J. Waterer and Sons, Bagshot, for rhododendrons; to Mr. Chas. Turner, Slough, for primulas, etc.

Bronze Flora.—Messrs. J. Peed and Son, West Norwood, for alpines.

The Royal National Tulip Society.

The sixteenth annual show of the Southern Section of the above society was held, in conjunction with the ordinary fortnightly meeting of the R.H.S., at Vincent Square, on Tuesday. The show was by no means a large one, for it only filled about half of the annexe on the left of the door. The competition in some of the classes was keen, but taken as a whole, the quality of the flowers was poor. The "feathers" were an exception, and amongst these a William Annibal, which was in Miss Willmott's stand of twelve

THOMAS GREEN & SON, Ltd., Smithfield Ironworks, Leeds, & New Surrey Works, Southwark St., London, S.E.

rectified tulips, was particularly good. Mr. Needham had an excellent Stockport (byblœman), and Mr. Hall a good Sam Barlow (bizarre).

An encouraging feature of the society is the fact that new seedlings are making their appearance, some in a broken state, but the majority as breeders. Mr. A. D. Hall has several hundred blooming in his garden at Cambridge this year. One of his best is a bizarre breeder, which he has named Gleam. It is a most promising flower. We were much struck with the size and freshness of Mr. W. L. S. Loat's collection of May-flowering and Darwin tulips. Unfortunately, the blooms were on very short stems, and in many cases this meant that they were shorn of much of their grace and beauty. This was very apparent in the two smaller classes for Darwins and cottage varieties, where he divided the honours with Miss Willmott. Mr. W. Peters, the hon. secretary of the society, has worked hard for the show, and is to be congratulated on getting together such an interesting collection of flowers. The lateness of the season was visible in many of them, which were shown in too young a state to do them justice.

The following is a list of some of the chief prize-winners this week:

Twelve dissimilar rectified tulips.—1, Mr. C. W. Needham; 2, Miss Willmott; 3, Mr. A. D. Hall.

Six dissimilar rectified tulips. — 1, Miss Willmott; 2, Mr. W. Dunn; 3, Mr. A. D. Hall.

Three feathered tulips.—1, Miss Willmott; 2, Mr. A. D. Hall.

Three flamed tulips.—1, Miss Willmott; 2, Mr. A. D. Hall.

In the single bloom classes Miss Willmott and Messrs. Dunn, Hall, and Needham divided most of the prizes. An interesting class, partly because it perpetuates the memory of the great florist, the late Mr. Samuel Barlow, is that for the best pan of rectified tulips. Miss Willmott was first with Annie Macgregor and William Annibal; Mr. Hall was second with Samuel Barlow and attraction.

National Auricula Society.

(NORTHERN SECTION.)

This exhibition was held at the Coal Exchange, Market Place, Manchester, and an unkindly season robbed it of much of its usual quality. The hot sunny days about Easter started the plants into a forced unnatural growth, bitterly cold nights checked them, and consequently northern-grown stage auriculas were either poorer in size and quality than usual, or not in bloom. Alpine auriculas, not being so exacting in their requirements, have come through the trying time better, but the show would have been better had it been held a week later. It is also distinctly poorer because of the absence of Mr. T. Lord's exhibits, and the refined novelties of Mr. Ben Simonite, whose lamented death about a month ago is a great loss to all who love the auricula. There are, however, some compensations, and a pleasing feature was the prominent position certain of the younger growers are taking, particularly Mrs. Helen Young, of Chorlton, and Mr. Antrobus, of Wilmslow, in stage and alpine auriculas. Polyanthuses were poor, and no exhibitor could be proud of the exhibits the season had allowed him. There were many meritorious novelties in alpine auriculas, and the judges were busy awarding well-deserved certificates. In show auriculas there were few novelties of merit staged. Mr. Bentley's red self Beethoven, which is something like Harrison Weir, was the only one to obtain a certificate.

SHOW AURICULAS.

In competition for the prizes for six, distinct, Mr. W. M. Shipman, Altrincham, occupied the post of honour with excellent examples of Abbe Liszt, Harrison Weir, Richard Headly, Acme, Shirley Hibberd, and Mikado; Mr. J. E. Beaumont, Stalybridge, followed for second place, staging Acme, Rachael, Ruby, Heather Bell, A. Barker, and Mrs. Potts; Mr. J. Stelfox, Stalybridge, was third. In competition for the prizes for four, distinct, Mr. W. M. Shipman was again first, staging as his varieties Acme, Dinham, A. Barker, and Mrs. Potts; Mr. J. E. Beaumont had as his second-prize set George Rudd, Acme, Shirley Hibberd, and Mrs. Potts. The best pair in the open class was that shown by Mr. J. Antrobus, Wilmslow, the varieties being Shirley Hibberd and Ruby; Mrs. Young was second with Gerald and Shirley Hibberd; Mr. W. H. Midgley, Halifax; Mr. A. Preston, Nelson; Mr. T. Sharpe, Kendal; Mr. T. Lomax, Stalybridge; and Mr. J. W. Bentley were also successful competitors in the class. In the corresponding class open to maiden growers only, Mrs. Young, Mr. A. Preston, and Mr. T. Sharpe were the prizetakers in the order of their names.

There was a very good competition in the class for three varieties, open only to amateurs not employing a gardener, and the premier award was made in favour of Mrs. Young, who staged George Lightbody, A. Baker, and Gerald; the remaining prizetakers were Messrs. J. E. Beaumont, J. Stelfox, and J. Fillingham. There was also a class for growers who had not competed previous to 1906, and in this the awards were made in favour of Mr. G. Etherington, Middleton, and Mr. J. Antrobus, the varieties staged being those already enumerated.

The classes for single plants were well filled, and in that for green-edged varieties, Mr. W. M. Shipman was first with Dr. Hardy and second with A. Barker, and Mr. G. D. A. Hall was third with Shirley Hibberd. The other successful exhibitors were Messrs. S. B. Bolton, T. Sharpe, and W. H. Midgley. In the grey-edged class, Mr. M. Shipman was first and third, and Mrs. Young second with George Rudd; Messrs. T. Sharpe and J. E. Beaumont were fourth and fifth with Traill's Beauty. The first and second prizes in the class for white-edged varieties were awarded to Mr. W. M. Shipman, who staged Eucharis and Conservative; Mrs. Young was third with Heather Bell; and Mr. J. W. Bentley fourth with Acme; Mr. J. Stelfox was fifth and sixth; Mrs. Young seventh; and Mr. F. Stringer eighth. The best single self was Mrs. Potts, shown by Mr. J. E. Beaumont, and Messrs. Hall and Stelfox were second and third with the same variety. Other successful competitors were Dr. G. A. Wright, Manchester; Mr. T. Sharpe, and Mr. S. B. Bolton.

In competition for the prizes for seedlings, Mr. J. W. Bentley was first with Beethoven and second with Audrey, and Mr. T. Sharpe was third with an unnamed variety. The premier show auricula was Acme, staged by Mr. W. M. Shipman.

ALPINE AURICULAS (SHADED).

Here Mr. J. W. Bentley was especially strong as evidenced by his taking the first prize in each of the two principal classes. In Mr. Bentley's first-prize six, distinct, were Pegg Colonel Kemp, Goldilocks, Vestal, Dr. P and Mrs. Brindle; Mr. J. Edwards follow for second place with good examples of T Pinch, Eldon, General Botha, and seedlings the remaining prizes in the class awarded to Messrs. W. M. Shipman, Dickins, Worsley, J. E. Beaumont, and Geggie, of Sale. There was a strong petition in the class for four, distinct, the first-prize set, from Mr. J. W. Bent comprised finely developed examples of M Apthorpe, Vestal, Goldilocks, and Luc Mrs. Young, who was second, stag Patience, Thetis, Miss Baker, and Duke York in fine order; Mr. J. E. Beaumont a close third with J. F. Kew, Leon Weber, and Teviot Dale; Mr. J. Stelfox, D G. A. Wright, and Mr. G. D. A. Hall also successful in the class. Mrs. Young tained the premier position in the class pairs, open, and Messrs. T. Sharpe, G. Eth ington, Jack Bentley, J. Antrobus, and Preston shared the remaining prizes. In class for pairs, limited to maiden grow Mrs. Young, Mr. T. Sharpe, and Mr. Ja Bentley were first, second, and third spectively. The prizes in the classes three, distinct, were awarded to Mrs. Young and Messrs. J. Stelfox, G. Geggie, and J. Edwards.

Single specimens were largely shown, an in the class for flowers with yellow cen Mr. W. E. Shipman was first with Fir and fourth with Brenda; Mrs. Y second with Duke of York; and Mr. J. W. Bentley third with Dr. Kershaw and with Child Harold. For varieties with lig centre, Mr. F. Faulkner was first with F and third with a seedling; Mr. G. D. A. H was second with Disley Gem, and Mr. W. Shipman fourth with Brenda. The premier alpine was Duke of York, shown by M W. M. Shipman.

GOLD-LACED POLYANTHUS.

In competition for the prizes fo black-ground varieties, Mr. J. W. Ben was first with Mrs. Brownhill, Tiny, Exile; and Mr. J. Fillingham second Mrs. Brownhill, Trilby, and Exile. In corresponding class for red-ground flow Mr. G. Geggie was first with Sydney Smith, George IV., and Master Fred; and Mr. J. W. Bentley was second with George IV., M ton Favourite, and Sydney Smith. M Young, and Mr. W. Stringer were third and fourth respectively. For a sing black-ground flower, Mrs. Young was with Mrs. Holden; Mr. Lomas second Marie Scholes; Mr. J. W. Bentley third Mr. W. Stringer fourth, with Mrs. Br hill. For a single red-ground flower, Mr. Geggie was first and second with Syd Smith, and Mr. J. W. Bentley was and third with Mrs. Holden.

The premier gold-laced polyanth Marie Scholes, shown by Mr. Lomas. class certificates were awarded as To Mr. J. W. Bentley, for self auricula thoven; to Mr. Geggie, for alpine au J. W. Bentley; to Mr. Faulkner, for alp auricula Frank; and to Mr. Hall, for al auricula Disley Gem.

Name ....

Address ....

buildings in question, with sundry others, was £350,000. There are also other blocks in course of erection, also the gigantic clock tower, 325 feet in height, with its roof nearly completed; the cost of these additions will probably exceed £100,000. The clock, which will be illuminated by electric light, has a dial no less than 17 feet in diameter; the bells of the clock are suspended in a turret above the balcony, the largest weighing 6½ tons, or considerably more than "Big Brum" of the Art Gallery, Birmingham. The tower will be fitted with a suitable lift, and eventually will serve as one of the most striking landmarks of the district.

After inspecting the interiors and witnessing a series of demonstrations in the engineering and other departments, the party was conducted over the vast area of ground surrounding the buildings by Mr. Harry Bick (a member of the association), who is superintendent of the grounds. Portions are devoted to cricket, football, bowling greens, etc., and there is also a botanical garden, which is under the immediate directorship of Professor Hillhouse. An interesting object was that of a "boulder" stone, unearthed during the removal of a large quantity of soil in the formation of one of the slopes, and it was retained in situ upon a mound of the substratum. The total area of the University is about 50 acres. In close proximity to the University site is erected a large hostel for women students; the hostel for the men is situated in the city at Queen's College.

The total cost of the buildirgs and equipment of the University is estimated at upwards of £500,000.

FORTHCOMING ENGAGEMENTS.

TUESDAY, May 25.—Royal Horticultural Society's Great Exhibition at the Inner Temple Gardens, three days.

Kew Guild Annual Meeting at 6.30 p.m., at the Holborn Restaurant, to be followed by the annual dinner.

WEDNESDAY, May 26.—Bath and West of England Agricultural and Flower Show; five days.

British Gardeners' Association Annual Meeting at Exeter Hall, 7 p.m.

THURSDAY, June 3.—Linnean Societ meets.

SATURDAY, June 5.—French Horticultural Society of London.

MONDAY, June 7.—National Fruit Growers' Federation, council meeting.

TUESDAY, June 8.—Royal Horticultural Society; committees meet at 12 o'clock; lecture at 3 p.m. on "Some Old Superstitions about Plants," by the Rev. Professor G. Henslow, V.M.H.; Scientific Committee at 4 o'clock.

OBITUARY.

◆

MR. NORMAN C. COOKSON.

It was with feelings of the deepest regret we learned, on Monday last, of the death of Mr. Norman C. Cookson, at Oakwood, Wylam-on-Tyne, late on Saturday, May 15. For some time past Mr. Cookson had suffered severely, and his friends knew his life was in danger, but hoped that he would be spared for many years. It is as a horticulturist of the best type, and as the raiser and owner of a fine collection of rare and beautiful orchids that Mr. Cookson is best known to our readers; but, as it was only a few days ago that we drew attention to the leading features of his beautiful gardens at Wylam (see p. 356), we need not recapitulate, save to say that a vast number of seedlings derived from the intercrossing of the finest orchids have yet to flower at Oakwood, and show the skill and discrimination of the master who has now departed. On April 6, 1907, we gave Mr. Cookson's portrait in these pages, and referred briefly to his business activities. He was interested in mining of many kinds, and his training, keen business ability, and magnificent memory made him one of the captains of industry. He was the head of the firm of Cookson and Co., and of the Howdon Lead and Antimony Works, chairman of the Mickley Coal Company, a director of the Parson's Turbine Company, and held interests in Mexican silver mines, New York metal works, and Cornish tin mines. In his care for the workman in his various businesses Mr. Cookson was a model employer, and he had taken precautions for the preservation of the health of those employed in the lead works long before an Act of Parliament rendered precautions compulsory; and, indeed, it is well-known that the Home Office regarded Cookson's Lead Works as the model of perfection, and representing a state of affairs far beyond what any Act of Parliament could hope to secure. We have seen with our own eyes the way in which the miners of Mickley and their families have been cared for, and how Mr. Cookson used the heat that would otherwise have escaped, to light up the mine with electricity. He encouraged the horticultural spirit among the miners in the Wylam district, and numbered several of the enthusiasts among his friends. In Wylam, West Wylam, and Prudhoe there are homes where tears of sorrow and sympathy have flown freely these last few days, for Mr. Cookson was greatly loved. He was not a demonstrative man, cared not to hear his praises sung, and was always ready to help every good non-sectarian and non-political work. His family built the handsome Institute at Wylam, and he himself at one time provided half the necessary funds for sick nursing at Wylam, and was always a liberal contributor to the funds.

Mr. Cookson was born at Newcastle in 1841, was educated at Harrow, and came to live at Oakwood thirty-five years ago. He leaves a widow, four sons, and two daughters to mourn their loss, and to these we venture to tender our sympathy, and that of our readers, for all the horticultural world mourns the death of Norman C. Cookson, who was laid to rest at Ovingham Cemetery, on Tuesday, May 18.

TRADE NOTE.

The well-known and old-established business of John Forbes, nurseryman, Hawick, has been incorporated as a private limited company under the Companies (Consolidation) Act, 1908, under the name of "John Forbes, Hawick, Limited." We understand that the shares are all taken up by Mr. Forbes and his family, and that the incorporation is made for family purposes only. We wish the new company a continuation of the prosperity which has marked the business hitherto, and recently secured for it the distinction of royal patronage.

ANSWERS TO CORRESPONDENTS.

PLANTS UNDER GREENHOUSE STAGING.—J. E., Norfolk: There are numerous plants all suitable for covering the ground beneath the staging of a warm greenhouse, and they can be readily obtained from any nurseryman. The chief of these are Selaginella Kraussiana, and Helxine Solieroli, both low-growing creeping plants; Tradescantia zebrina, Rex begonias in variety, Fittonia argyroneura Pearcei, and Pteris cretica, etc. If a strong plant of the latter is secured, and the spores are distributed about the soil, and also on the walls behind, many plants will appear presently, and these will probably thrive better than the planted ones.

ORCHID COLLECTOR'S SALARY.—T. M., Bradford: It is practically impossible to give what has been the maximum and the minimum salary for an orchid collector. In the old days, a quarter of a century or so ago, when plant-collecting was quite a business, we remember hearing of £100 a year, with every expense paid from start to return, as a suitable salary. Higher sums have been paid, especially when the collector has had to take considerable risks.

VALUE OF DAFFODIL BULBS.—M. A. J., Marazion: Very much depends upon the bulbs themselves. If they are of good size for the variety, well ripened and weighty, then a fair wholesale price per 1,000 for Golden Spur would be 30s.; Sir Watkin, 25s.; Emperor, 25s.; and Horsfieldi, 25s. Slightly higher prices may be made if the bulbs are very clean and shapely, and useful for retail dealing.

CUTTINGS OF BEGONIA GLOIRE DE LORRAINE.—F. S. S., Nottingham: From the plants that have flowered, rested a little and put into warmth again, new growth should now be appearing, and these form excellent cuttings if taken when about an inch and a-half long. Place them in light sandy compost, and keep in a close propagating frame until rooted. Be careful not to afford an excess of moisture, or the cuttings will damp off.

EPIPHRONITIS VEITCHI.—S. R. L., Manchester: It was in our issue of May [illegible], 1908, that the culture of Epiphronitis Veitchi was dealt with at some length by Mr. H. J. Chapman. He pointed out that the stems that have flowered are constantly breaking into new growth, and these growths may be cut off when the roots make their appearance, and potted in the usual way. Strong shoots may be either laid out in a bed of moss, or they may be cut into short lengths, and inserted as cuttings in a mixture of sphagnum moss and sand, where they readily produce growth. Few orchids lend themselves so readily to propagation as Epiphronitis Veitchi.

SIX KINDS OF VEGETABLES.—H. W., Bucks: From the several kinds mentioned we should select the following as most suitable for a competition in August: Potatoes, tomatoes, peas, cauliflowers, carrots, and onions.

NATIONAL CHRYSANTHEMUM SOCIETY.—F. E. G., Haslemere: We regret that in our issue of May 15, p. 386, we gave the address of Mr. R. Witty, the secretary of the National Chrysanthemum Society, as Swain's Lane, Highgate. We find that Mr. Witty has left the paternal home, and set up a menage of his own at 72, Savernake Road, Gospel Oak, N.W.

HOW TO APPLY FOR AN ALLOTMENT.—L. N., Yeovil: An allotment may be of any size up to five acres. Applicants in rural parishes should write to the clerk of the Parish Council, or to the chairman of the Parish Meeting if there is no Parish Council, and applicants in urban districts should write to the clerk of the Urban District Council or the Town Clerk, as the case may be. They should state the amount of land required and whether arable or grass, and if any particular piece of land is desired it should be mentioned. It does not follow that the Council will be able to obtain this particular land, but the information furnished will be of use to the Council by enabling them to meet the wishes of applicants as far as possible. Where rules have been made by a Council as to the manner in which applications are to be made, the rules should be carefully observed. Allotments cannot be sold to applicants, but may only be let. No allotment may be sublet. Allotment tenants are entitled, on quitting their allotments, to compensation for unexhausted improvements under the Agricultural Holdings Acts, or under the Allotments and Cottage Gardens Compensation Act, 1887.

SMALL HOLDINGS. L. N., Yeovil: The definition of a small holding, according to the Board of Agriculture is as follows: A "small holding," for the purposes of the Small Holdings Acts, means an agricultural holding which is more than one acre and not more than fifty acres in extent. It may, however, exceed fifty acres provided the annual value for the purpose of income-tax is not more than £50. Applications for small holdings should be made to the clerk of the County Council, or in the case of residents in a county borough to the Town Clerk. There is no restriction in the Small Holdings Acts as to the class or sex of persons that may apply for small holdings, except that they must "themselves cultivate the holding." This expression is not to be understood in a narrow sense. The Acts define "cultivation" to mean the use of land for any purpose of husbandry, including the keeping or breeding of live stock, poultry, or bees, and the growth of fruit, vegetables, and the like. Applicants will be expected to satisfy the Council that they have sufficient experience and means to work a small holding with the prospect of success. There is no provision in the Acts for the advance of money out of public funds to individuals taking up small holdings. Councils can purchase or hire land for small holdings either within or without the county or borough. If they are unable to obtain land by agreement, they can, with the sanction of the Board of Agriculture and Fisheries, acquire land compulsorily subject to the restrictions referred to in the case of allotments. Councils have certain powers of adapting land for the purpose of small holdings, including the power to erect dwelling houses and other buildings. Land that has been bought by a Council by agreement can either be sold or let to a small holder, but land taken on lease, or acquired compulsorily, can only be let. The rent to be paid by a small holder will be fixed by the Council at a sum not less than is sufficient to cover the rent or the interest on the purchase money paid by the Council, with the addition of a fair proportion of the cost of adapting the land for small holdings, and a sum to cover management and other expenses.

NAMES OF PLANTS.

Berwick.—Primula rosea.

W. J., Axminster.—1, Dielytra spectabilis; 2, Ginkgo biloba; 3, Odontoglossum

Chester.—1, Phœnix Roebelini; 2, Veitchi; 3, Pandanus utilis; 4, Tillandsia Lindeni.

E. B., Worcester.—1, Clematis montana; 2, Alyssum saxatile; 3, Selaginella; 4, Berberis stenophylla; 5, Taxus baccata.

W., Shotley. — 1, A dark form of Primula cortusoides; 2, Bifrenaria Harrisoniæ; 3, Adiantum formosum; 4, Polypodium vulgare; 5, probably Adiantum affine, not a good specimen to judge from; 6, Dieffenbachia Pearcei, probably, but the leaf is not in character; send a leaf in July or August; 7, Oncidium Van Oosterzeei.

HUTS FOR THE GARDEN.—Fruit Rooms, Potting Sheds, Workshops, Cycle Houses, Boot Rooms, Servants' Mess Rooms, Children's Play Rooms, etc. Send for Illustrated Catalogue free.—BOULTON and PAUL, Ltd., Manufacturers, Norwich.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WINTER WASH for dormant Trees acts like magic, clearing the Trees and Bushes of all Insects' Eggs, Moss, and Fungoid Growths. XL ALL LAWN SAND, a weed eradicator and fertiliser for weedy and poor lawns. XL ALL WEED KILLER used once a year "No weeds can live." Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

[illegible] 1.30 o'clock.—A splendid lot of choice Ornamental and Decorative PALMS and PLANTS, Standard [illegible], etc.; choice Greenhouse Plants, Ferns, Pot Roses.

MESSRS. PROTHEROE and MORRIS will SELL the above BY AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C. On view morning of sale and catalogues had.

To be Sold.

FOR SALE, with immediate possession, the property known as "FRUITLANDS," CARTER-[illegible], NR. WITNEY, OXFORDSHIRE, consisting of [illegible] ACRES OF FREEHOLD LAND, of which about 6 acres are planted with valuable fruit trees, now coming into bearing; the remainder arable, with a good house and horticultural buildings.

The house is a modern erection of concrete, roofed with the celebrated Rowlands Castle Tiles, and heated throughout by radiators from a single furnace in the basement, and contains 2 sitting-rooms and 5 bedrooms, besides the usual domestic offices, bathroom with hot and cold water. Extensive views from the 3 upper rooms, each of which has a balcony.

About 60 yards from the house there is a compact, well-built office and store, and on the northern boundary, pig styes and stabling. 3 hothouses each 100 feet long, fitted with modern heating apparatus.

There is a private entrance to a good main road, as well as accommodation road to side.

Good tanks for collection of rain water, and excellent supply of water from a well, for domestic use.

Price, including valuation of fruit trees and crops as they stand, £2,500, of which part can remain on mortgage if desired.

Apply to F. WESTELL and SON, Solicitors, Witney, Oxon.

ROCK, Alpine, Wall, and Water Gardening, Stone Paving, etc.—Consider your plants, and [illegible] by using the celebrated HACKENDEN [illegible] (as used in R.H.S. exhibits, May 18th, [illegible] Show), guaranteed to stand all weathers; [illegible] blocks sent to any part by Sole Agent, H. HEMSLEY, F.R.H.S., Sussex Seed, Bulb and Nursery Establishment, Crawley. Work carried out or advice given, re above subjects, in any part of the country, distance no object. NEW INTRODUCTION.

CHARMING ALPINE.

SILENE LACINIATA PURPUSI.

Certainly one of the Finest Introductions of Recent Years.

A very rare species discovered at an elevation of 11,000 feet on the high mountains of Mexico.

A charming rock plant, narrow green leaves, somewhat wooley, of a very graceful spreading habit; flower stems ranging from six to eight inches, producing very freely nearly the whole summer rich, fiery, cardinal red flowers; deeply laciniated.

This plant has wintered on our rockery in a very exposed position.

Strong Plants, 1/6 each; 15/- doz.

"Eureka" WEED KILLER.

Many years' reputation, no new experiment—it is the favourite and certainly the safest and best preparation for ensuring

CLEAN PATHS.

Not only are the top weeds killed but the roots are destroyed and the paths and drives kept clean and bright for 12 to 18 months.

Users of Weed Killer know full well what is required—the first consideration is satisfactory results, and the next is favourable prices. Some makers are advertising various strengths, reduced prices, etc., etc. We give the following straightforward prices, and if you compare you will find they are as satisfactory as the Eureka itself:

1/-	**tin to dress**	**50**	**square yards.**
1/9	**do.**	**100**	**do.**
6/-	**do.**	**400**	**do.**
49/-	**keg do.**	**4,000**	**do.**

Larger quantities at lower prices, carriage paid; no charge for packages. Agents in most towns, or we send direct to you giving name of nearest Agent.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

The Temple Show.

Twenty-two years have run their course since the first of the horticultural exhibitions under the auspices of the Royal Horticultural Society was held in the gardens of the Inner Temple, and throughout this comparatively long number of years there has been a continuous increase in the interest and attractions of the exhibitions, and uniform progress in the development of the horticultural activities of the United Kingdom. There is no occasion we should here speak in detail of the exhibition that has been held during the past week, as the illustrated report which appears in another part of this issue gives the fullest possible information relating to its many features. It will suffice to place on record the fact that it was, as a whole, fully equal to the high average that has been maintained for many years past, and that it was a magnificent demonstration of horticultural enterprise, and a veritable triumph of organisation. We have something more than the ordinary degree of pleasure in being able to speak thus appreciatively of the exhibition, because rumour has it that it may be the last of the series that will be held in the gardens of the Inner Temple, and it is highly satisfactory there should have been continuous progress throughout. Twenty-two years form a comparatively short period in the life of a society that celebrated its centenary some years ago, for there can be no question that during that period the Royal Horticultural Society has exercised a greater influence for good upon the horticultural activities of the country than in any other period of its history. We might, perhaps, go further, and suggest that the society has accomplished more for the advancement of horticulture, as a whole, during the period over which the Temple Shows have extended than in the fifty years by which it was preceded. Whether this be the case or not, the society has accomplished an immense amount of useful work on behalf of gardening, and not the least valuable of its many activities has been the holding of the Temple Shows. These gatherings, wholly unlike those that had been held at South Kensington, and, indeed, unlike those which are held elsewhere, have, by allowing exhibitors to show what they like, within certain limitations, given them opportunities for presenting to public notice plants and flowers of much interest, that, under traditional arrangements, would have been impossible. As the result visitors have had opportunities for becoming acquainted with all that is best in stove and greenhouse, in orchid house and fernery, in herbaceous border and rockery, in shrubbery and plantation, and in bog and water garden. Everything likely to add to the charms of the garden and the home has been heartily welcomed, the exhibitions have proved educationally valuable, and to the object lessons obtained from a visit to them may be traced the greater diversity in the attractions which gardens now possess. That they have also had a stimulative influence upon raisers there can be no doubt, and it was interesting, in walking through the tents on Tuesday, to observe many plants occupying prominent positions that were practically non-existent a quarter of a century ago. Orchid hybridisation had obtained attention long before the Royal Horticultural Society selected Westminster as its headquarters, but the raising of seedlings had not become general, or indeed made much progress, for the orchids at the first Temple Show consisted chiefly of species and well-marked varieties. Of late years the raising of orchids from seed has become so general, and has been carried out with so much success, that the greater proportion of the magnificent display of these fascinating flowers which delighted thousands of visitors during the past week, were mostly home-raised. The number of new forms that have originated during the past two decades from hybridisation and cross-fertilisation in orchids has been surprisingly large. In turning to that storehouse of information, the "Gardening Year Book," we find that for some years past upwards of one hundred new orchids annually have obtained recognition at the Temple Shows and the society's fortnightly meetings. The beautiful race of streptocarpuses now so generally cultivated were unknown: stellate cinerarias are creations of quite recent years, as also are the perpetual carnations, which annually contribute largely to the attractions of the Temple Shows, and are grown in their thousands in private gardens. We had no brightly-coloured kalanchoe to brighten the conservatory; no Wichuraiana roses to give grace and colour to the garden, and beautify the conservatory in advance of the season of flowering outside; and no Pink Pearl rhododendron to enhance the charms of the flower garden. Concurrently with the creation of new classes and forms of plants there has been an enormous development in the cultivation of hardy perennials, and of rock and water gardening, and a largely increased interest in trees and shrubs remarkable for the beauty of their flowers or foliage. At the first of the Temple Shows there were but few trees and shrubs, but now they are

half of gardeninu, and not the least

MR. FRANK READER.

so high a state of development as to constitute a feature remarkable alike for its interest and attractiveness. Reference might be made to other evidence of advancement at the exhibition, but sufficient has been said to show that the progress made has been substantial, and that much of it may be attributed to the influence of the gatherings which have been so successfully held under the auspices of the Royal Horticultural Society in the Temple Gardens.

Mr. Frank Reader.—Not a few of the exhibitors at, and visitors to, the Temple Show during this week will have had cause to be thankful for the extreme courtesy and wonderfully genial manner of Mr. Frank Reader, the cashier to the Royal Horticultural Society. Few men can keep an even temper and a smiling face, no matter what the weather or what the circumstance, like Mr. Reader. He is a right jolly good fellow, and his unfailing memory for faces and for the idiosyncrasies of the Fellows of the society make him an invaluable servant. Under three treasurers he has looked after the finances of the society; under Sir Daniel Morris, the late Mr. Philip Crowley, and now under Mr. J. Gurney Fowler, all extremely capable gentlemen. When Mr. Reader entered the service of the R.H.S., in March, 1890, the annual income was comparatively small, and he has seen it rise from £4,100 to £21,900 a year. The society's investments have advanced from nil to £33,900, with the addition of buildings and equipment worth £40,900, and the Fellowship of the society has risen from 2,050 to 10,507. All this goes to show how greatly Mr. F. Reader's responsibilities have increased during his nineteen years' service. Mr. Reader is, we would add, held in high estimation by his neighbours, as well as by those who have business relation with him, for he occupies the position of churchwarden at Shirley, and is one of the trustees of the Playing Field and Village Institute. It is with great pleasure we present Mr. Reader's portrait to our readers this week, and we know that many will join with us in wishing that he may be long spared to fill his present position at Westminster.

Summer Heat. — There was a marked change on Friday, the 21st inst., in the weather, as compared with that experienced at the end of the previous week. On that date the maximum shade temperature registered in the Royal Gardens, Kew, was 84 degrees. On Saturday, the 22nd inst., the highest temperatures, according to the Meteorological Office, was 82 degrees at Margate and 81 degrees at Westminster. On Sunday, the 23rd, the temperature was equally high in the earlier part of the day, but, later on, it became rather cooler. The maximum of 84 degrees on the 21st inst. was 21 degrees above the averages for that date. There have been only two instances during the past 38 years in which this temperature has been exceeded by one degree, and these are May 30, 1895, when the maximum registered was 85 degrees, and May 26, 1880, when the thermometer rose to 86 degrees.

Royal Botanic Society.—On Tuesday last an extraordinary general meeting of the Fellows was held in the Club House for the purpose of considering the present financial position of the Royal Botanic Society. Mr. C. Brinsley Marley presided, and there was a strong muster of Fellows. It appears that for some time the Council have found that, with the increased cost of the maintenance of the gardens, the expenditure has been in excess of the income. Early in the year the annual subscription was raised from two to three guineas, but a sufficient time has not yet elapsed to enable the society to restore the balance of income and expenditure. The liabilities, including rent, wages, and office expenses, to the end of the year amount to about £5,000, and the Council hope to receive from fêtes and Fellows' subscriptions about £2,000. In considering the ways and means, it was at first thought that a donation of two guineas from each of the Fellows would be sufficient to pay off the adverse balance, but it was found that a donation of three guineas would be required. A motion to that effect was submitted by Captain J. Sparks, a member of Council, but Mr. Cecil Raleigh thought the society should not, in its present position, adopt half measures, and moved an amendment that donations of five guineas be invited, and in the result the amendment was carried.

Rhododendron Pink Pearl.—With reference to the origin of this beautiful rhododendron, Messrs. John Waterer and Sons, Lim., write: "Having noticed in recent issues of 'The Field' letters dealing with the origin of our hybrid rhododendron Pink Pearl, we think it might interest your readers to know that this most beautiful plant was raised by us in our nurseries at Bagshot. The many suggestions that have been made as to the possible parentage of this plant are, in many cases, very wide of the mark. It is obvious that we are not going to give away what is a valuable trade secret by exposing the parentage of Pink Pearl, as we have yet considerable hopes of raising even better varieties. It is somewhat hard lines that the only people who are really responsible for this plant have not been credited with raising it!"

Sale of Weed Killers and Insecticides.—At a recent meeting of the Birmingham Watch Committee, it was decided to grant licences to several seedsmen carrying on business in the city. In moving the granting of the licences, Alderman Sayer said that the applications were from the leading seedsmen of the city. They had all been in the habit of selling insecticides and weed killers more or less of a non-poisonous character. Where there had been preparations of a poisonous character it had been their custom to send the orders to the chemist, and the public had been somewhat inconvenienced by the delay. The chemists urged the danger of the sale of these articles, but that seemed a small point, because most of the trades used poisonous substances in their business, and the very fact that the seedsmen would sell these poisons in a particular manner seemed to the sub-committee a safeguard. The committee had the reasonable requirements of the public to consider, and gardeners would naturally go to the places where they bought their seeds and implements.

A Fortunate Gardener.—The late Dowager Duchess of Marlborough left Mr. F. Chamberlain, her gardener at the Deepdene, a legacy of £500.

Hop Shoots, which have long been used in Belgium as a table vegetable, are being sent to Covent Garden by the Belgian growers, and are retailed at sixpence per pound. The shoots that are being marketed are, as a matter of course, the green growths made in the open; but in Belgium blanched shoots produced early in the year by covering the roots with some light fermenting material or by placing the roots in a mushroom house are the most highly esteemed. Many years ago it was the practice in some country districts for the working classes to obtain supplies of the shoots from plants growing in the hedgerows. But with an extension of cottage gardening, the practice has largely decreased, if it has not wholly died out.

The "Gardeners' Magazine" in Siam.—We are daily receiving evidence of the continuous extension in the circulation of the Gardeners' Magazine abroad, as well as at home. Not so long since we mentioned that one of the firms advertising in its pages had received orders from several different parts of Russia. Now we have the pleasure of stating that H.R.H. Prince Chumphorn of Bangkok Siam, has for business purposes placed himself in communication with Messrs. H. Lane and Son, of Great Berkhamsted, as the result of the firm's advertisements in these pages. In writing to us with reference to the latter, Messrs. H. Lane and Sons observe, "It is really wonderful how the Gardeners' Magazine gets about."

Keeping Qualities of Large Onions.—It is assumed by a considerable proportion of cultivators and a large number of consumers that large onions, such as those usually seen in winning collections of vegetables at exhibitions, do not remain in a sound condition for so long a period as those of a medium size. There is some justification for the belief that large onions do not keep well, but this is wholly due to the course of procedure adopted in their production. It is simply a question of proper maturation, for when so grown that they become ripened in August, the largest specimens of Ailsa Craig, and other types grown for exhibition, will keep equally as well as those of such varieties as James' Longkeeping, grown under ordinary conditions. We have had an interesting proof of this during the present season. Early in April, Mr. E. Beckett, V.M.H., gave a lecture on the production of vegetables for exhibition at a meeting of the Twickenham Gardeners' Association. The cultivation of onions received, as a matter of course, a full share of attention, and at the close of the lecture the question was asked whether large onions, produced under the conditions that had been stated, would keep. As a proof that they will keep for many months after ripening, Mr. Beckett promptly handed round three bulbs of Ailsa Craig, weighing about 3lbs. each, that had formed part of the collection with which he had obtained premier honours at Shrewsbury in the previous August. We were present at the meeting, and at the close, Mr. Beckett handed us two of the bulbs that we might have an opportunity of seeing how much longer they would remain sound. One bulb showed signs of growth on May 7, and the other eight days later, but both were perfectly sound at the commencement of activity, and, when cooked, were so delicately flavoured that one could wish such onions could be obtained from the greengrocers in the usual way. Nine months had elapsed between the onions having been lifted and used, and this assuredly is as long a period as one could expect them to keep perfectly sound.

Fixation of Atmospheric Nitrogen. The paper read at the meeting of the Royal Society of Arts on Wednesday, 26th inst., was by Mr. Sam Eyde, who, with Professor Birkeland, both of Norway, discovered practical means of fixing the nitrogen of the atmosphere, and thereby producing nitrate of lime to replace the nitrate of soda now so largely used as a fertiliser.

ANTIRRHINUMS.

The increasing prevalence among genuine flower lovers of the modern taste for natural grace and beauty of form in plants is shown even in the humble snapdragon. Though we still see "Dwarf Gems" and grotesque striped forms, on the other hand we do not often see the sorts which grow four or five feet high, with lanky stems. The antirrhinum is never at its best when it is other than a graceful plant of free growth, and it is not easy to imagine any improvement upon the strain which some of the leading nurserymen are now sending out—strong-growing selfs attaining a height of some two feet, with large, broad-lipped flowers in a somewhat loose spike, and not closely compacted like the common toadflax (Linaria vulgaris). Self colours are preferred by most, though some like the white throat and the yellow or orange lip.

For flowering the first year seed should be sown under glass in February or early March, the seedlings so obtained making handsome plants from early July onwards. If the soil is a dry one they may be depended upon to stand any ordinary winter, and make fine, large, shrubby plants the following season; but if the soil is a heavy one, especially if it is in a damp situation, a mild or severe winter may be equally fatal to them. For standing the winter it is best to sow early in July, either in the open ground or in pans, and prick out the seedlings on a bed of firm, and not too rich, soil in a sunny position, where most of them will stand the winter.

Plants which have flowered seem to have much less power to stand the winter than young ones, and so have either young or old plants which are moved in the late autumn. When the conditions of soil and climate are so adverse that they cannot be depended upon to stand a normal winter, it is best to pot up the July seedlings in sixties, and either sink them in cinder ashes in the open, or, better, put them in a frame for the winter. Given plenty of air the large majority may be expected to survive, though some always die without apparent cause.

Antirrhinums are common objects on old walls, from which it may be inferred that they like old mortar rubbish, and, as a matter of fact, this is one of the best things to mix with the soil, which should be firm, with little, if any, fresh animal manure in it, the latter often resulting in the withering away of plants in an otherwise inexplicable manner.

The uses to which antirrhinums may be put in the flower garden are very varied. For rows, or other places in formal flower beds, they always seem to me rather out of place, partly because it is usual to employ the dwarf forms for this purpose, and partly because I do not care to see hardy flowers associated with tender ones. Their most suitable position in the garden, as a rule, is in the mixed border, amongst plants of low growth, on the rockery, and on dry banks or walls; and although, on account of their growing in any dry place, it may seem a pity to give up the better parts of the garden to them, yet they are often used with very good effect on semi-permanent beds of hardy flowers.

When visiting the Royal Horticultural Society's summer show two or three years ago in the grounds of the Royal Hospital, Chelsea, I noticed in the Ranelagh Gardens a large bed of iris planted in clumps some two feet apart, while the interspaces were occupied by antirrhinums of various colours. The effect was very pleasing, the foliage of the irises, which were then off flower, helping to show up the gorgeous colouring of the antirrhinums, while the bed, being in a dry place, exposed to the sun all day, the latter were extremely floriferous, without any undue rampancy of growth. I employed them myself in a somewhat similar way last summer. Following a bed of daisies, I planted out early-flowering chrysanthemums in the middle of June straight out of pots, in groups of three. I planted between the groups small antirrhinums, which had been raised from seed some three months previously. The latter flowered profusely, just overtopping the chrysanthemums in July and August, and really making a handsome bed of themselves. By the time the best of the blossom was over the chrysanthemums had grown well above them, and soon they crowded them out altogether. As a method of getting three floral displays on a bed in one year it may serve as a suggestion for others.

When buying seed, obtain the best strain procurable, and, though the effect of one colour only may be best, I should advise a mixed strain, unless some particular colour is wanted in the garden scheme, as it provides more interest. About 80 per cent. of the seedlings from good seed may be expected to come true to colour, and a good many of the remainder not far out. When planting out seedlings from mixed seed the colours can be foretold in a broad way by the colour of the stems and leaves of the young plants.

When a good strain has been obtained in sufficient variety to satisfy the owner—and there may be some disappointment even when a good price has been paid for the seed—it is worth keeping and propagating by means of cuttings, as seed saved from specially good specimens cannot be depended upon to come true when the plants selected are surrounded by others of dif-

TEMPLE SHOW.—ROSE LADY GODIVA (MESSRS. PAUL AND SON).
A beautiful rambling rose with pale flesh-pink flowers, grown in pillar form.

ferent colours. Cuttings may be taken in June or early July, the shorter laterals broken off at the junction forming the best material for the purpose. Put round the sides of pots with a little sand, and set in a house or cold frame, they strike in about a month, and may be potted off into sixties and kept in a cold frame for the winter. They make a tuft of young shoots at the base during the autumn, and so make good-sized bushes the following summer, flowering in early June.

Antirrhinums on an old wall give so good an effect that it is worth while taking a little trouble to establish them there.

TEMPLE SHOW.—TULIP DR. HARDY (MESSRS. BARR AND SONS).
A fine flamed florists' variety; flowers yellow and maroon.

The best time to sow the seed is in early August, so that the late summer and autumn rains may cause the seed to germinate and give the young seedlings time to push their roots deeply into the mortar before the frost comes. They will flower the next season, though the plants will still be small, but the second year they will make fine handsome plants. If the seed is sown in the spring there is a chance of a long period of dry weather, so that either the seed does not germinate or the little seedlings are dried up in a hot June before they are sufficiently established. When once established in such a position they may be trusted to take care of themselves.

Alger Petts.

HINTS FOR SUMMER BEDDING.

In view of the fact that the bedding-out season is now with us, I venture to offer a few remarks as to the disposition and arrangement of plants, and, at the outset, it may be said that it is possible to create beautiful and artistic effects with a very limited number, and also that it is an easy matter to bring about inharmonious muddle, through the indiscriminate use of large numbers of varieties.

The skilful association of colours is responsible for the beauty found in flower beds that are laid out and planted with taste, and happily it is very seldom that we find glaring mistakes in this matter nowadays. Something in the shape of a revolution was effected in the style of bedding out some years ago, and, in order to keep pace with the times, simplicity must be the watchword; combinations that are soft and pleasing are the attraction, as opposed to the displays that made one blink under the old methods. It is not at all unusual for flower beds to be tenanted by three or four distinct sets of plants during the summer, and both stove and greenhouse plants, with roses, perennials, biennials, and annuals are pressed into service, and under these conditions monotony is out of the question.

It may prove of interest if I give particulars of a few beds which struck me as being highly effective last season, and altogether one of the best was composed of Begonia Lafayette, arranged eighteen inches apart, Mesembryanthemum corditolium variegatum acting as a carpeting, and Vitis variegata, Abutilon Sovitzi, and Eulalia gracillima variegata used as dot plants. A huge oblong bed contained a rich crimson single begonia of immense build, the plants two feet apart, and here Centaurea candidissima compacta provided a very fine carpet, while a deep blue verbena formed a foot wide framework. It will occur to the cultivator that violas, Niphetos, Bullion, or Skylark, also the wonderfully floriferous Kœniga maritima, would be very suitable and just as effective as carpeters. A strikingly beautiful combination was seen in deep yellow antirrhinums with Salvia patens towering above them, Verbena Defiance providing a very wide belt.

One cannot well conceive anything more lovely than Celosia plumosa in company with Lilium lancifolium rubrum, L. l. roseum, or L. l. album, and we cannot find anything to equal Viola lilacina as an edging, and it should take the form of double lines. As a foliage bed of medium size, the following produced a very pleasing effect: Groups of Coleus Verschaffelti, Cineraria maritima, Iresine Lindeni, Pelargonium Crystal Palace Gem, and a wide edging of Fuchsia Meteor. The beautifully marked Zea quadricolor was arranged 3ft. apart over the whole. Purple-flowered ten-week stocks, with large and well-flowered examples of Fuchsia Ballet Girl, and panels of blue and white lobelia, with a single plant of croton-leaved beet, and Anthericum variegatum arranged in the centre of each panel respectively, proved very effective.

Bush and standard hydrangeas, enormous plants of Agapanthus umbellatus, and groups of Canna President Faure, with a splendid mass of Phlox Drummondi grandiflora forming a belt eighteen inches wide, struck a bold note. It was a happy idea to bring Pelargonium West Brighton Gem and pure white Iceland poppies together, and the purple lobelia seemed quite at home with them. Quite one of the loveliest beds I have ever seen was composed of groups of half a dozen Lobelia cardinalis Firefly arranged four feet apart, the intervening space being filled with the snowy Kœniga maritima, while a two-feet wide edging of Viola lilacina encircled the whole bed, which, by the way, was of enormous dimensions. Half a dozen perfect specimens of Dracæna indivisa contributed both dignity and grace to this bed. Very fine was a mixture of Lilium longiflorum, Acalypha tricolor, and Iresine Lindeni, the bed being edged with Chlorophytum variegatum, and the same may be said of [illegible] plants of Bouvardia Humboldti cory[illegible] flora, with a carpet of blue violas, and [illegible] edging of Stellaria graminea aurea. [illegible] merous beds were noted containing ca[illegible] tions and violas, a happy combination, [illegible] in this case it is advisable to grow the [illegible] named in pots in order that they may [illegible] removed without check after flowering.

I have said nothing about ivy-leaf [illegible] goniums in specimen form, but their [illegible] as also that of fuchsias, Strep[illegible] Jamesoni, and heliotropes, is too [illegible] known and appreciated to need comm[illegible]

Walter H. A[illegible]

BULBS.—A practical treatise on the cultivation of hardy, hothouse and greenhouse bulbous and tuberous rooted plants is "Bulbs and their Cultivation," by T. W. Sanders, price 2s. 6d. net, or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

HOME-MADE INSECTICIDES.

Among the many difficulties a gardener has to contend with, in order to keep his plants in a vigorous state of health, and secure satisfactory yields of fruits and vegetables, insect pests are perhaps the most troublesome to thoroughly overcome. True, there are so many preparations on the market for specific purposes that an inexperienced grower is apt to conclude he has nothing to do but apply a dressing of this or that to exterminate a certain foe, and has to learn from practice that a knowledge of the life history of the insect, and repeated applications of an insecticide, is essential to success.

It is necessary to know how old the insect is before it lays eggs, and how long the eggs require to hatch, to be able to deal with it in a systematic manner. A dressing of quassia extract compound will kill all the green-fly it touches, but it does not affect the eggs, so that the evil may be as bad in the course of a week as it was when first attacked. Immediately after the dressing some of the eggs will hatch, and the insects thus brought into life will lay eggs in their turn, and fresh broods be provided to harass the plant cultivator. Have the plants affected syringed with this, or some other efficacious insecticide, say twice a week for a fortnight, or month, as the case may be, the evil will be got rid of. In most instances it will be found advisable to err on the side of syringing with an insecticide too often and too long than in not applying it often enough, or for too brief a period. To stamp mealy bug out of a garden I once had charge of, all the plants affected were confined to one house, and regularly syringed with a reliable insecticide every Friday evening for three months, with the result that, so far as I know, not a mealy bug has been seen there since, and this is over twenty years ago. In dealing with all insect foes our methods must be organised and persistent, if we hope to attain success, and a reliable specific must be employed in each case. It is a want of method and knowledge of the life history of our insect pests which often leads us to fancy that certain preparations for specific purposes are not effectual as a permanent remedy, and induces many to try experiments with concoctions of their own, with ruinous consequences. In a wide and varied experience I have rarely found any of those home-made preparations of much value as insecticides, and more often than otherwise, seen most disastrous results follow their application. I invariably find, too, that those who take upon themselves the compounding of preparations for the destruction of insect life have no knowledge of chemistry, or the action of certain substances on the tissues of plants. Their idea seems to be simply to find something that will kill insect pests, and, as a rule, the crudest and most injurious substances are experimented with. A favourite subject utilised for this purpose is petroleum—the most penetrating of all oils, and the most inimical to plant life. Wise experimenters would test the effects of their concoctions on useless plants, but, in many instances, the egotistical inventors apply it with an unsparing hand, and kill both insects and plants. Not long ago I came across three vineries and two peach houses where all the plants were killed to the ground by an application of one of those crude mixtures containing petroleum. The peaches were useless and had to be replaced, but the vines [illegible] growths from the base. Recently [illegible] another vinery where the vines had undergone similar treatment. In every instance the gardener in charge tried to convey the idea that the unhappy state of his plants was due to some special manure, or other influence outside his control, and found it hard, at least so far as appearances went, to realise that the mishap was due to the injurious substances in the mixture the vines had been painted with.

Some of these crude insecticides have contained arsenic—a substance employed in the preparation of some weed destroyers. With a special insecticide for a certain insect, for no insecticide will act inimically on all, and this employed in a thoroughly organised manner, a perfect cure may be expected; but, home-made mixtures of various substances, of which the nature is not understood, should be handled with very great discretion if mishaps like the foregoing are to be avoided, and reputations saved from blemish. Pedestrian.

TEMPLE SHOW.—TULIP INGLESCOMBE PINK (MESSRS. ALEX. DICKSON AND SONS).

A beautiful May-flowering variety, with large pink flowers.

Large White Cabbage Butterflies.—I have never before seen so many of these butterflies about so early in the season. In town and suburban gardens they almost swarm on bright, sunny days. Gardeners must be on their guard, and protect their crops of cabbages and turnips. The eggs will be found in clusters on the undersides of the leaves, and these eggs should be destroyed forthwith. It is not a difficult matter to examine a small or a medium-sized patch of plants now, but very tedious and ineffective to try and do so later in an endeavour to get rid of the resultant caterpillars from the hearts of the plants.—Geo. Garner.

WATERING AND MULCHING WALL FRUIT TREES.

The inexperienced cultivator may overlook the fact that the soil around the roots of fruit trees near walls is at all times drier than in the open quarters of the garden. I have lately noticed certain trees growing in a naturally light soil in my own neighbourhood, suffering from insufficient water at the roots. Some of the leaves even were turning yellow; the cold nights and prevailing east winds aggravating the evil of over-dryness at the roots.

Not only should water be judiciously given, but a mulch of half-decayed manure and some lumpy fibrous turf mixed with it, be applied as a top-dressing directly the water has soaked in. Very often one sees the border soil trodden down very firmly over the roots of the trees, owing to the tramping to and fro of various persons who attend to the trees and other crops growing in the wall border.

A firm rooting medium suits fruit trees better than a loose one, but the firmly-trodden, smooth surface prevents the water soaking in when it does rain, and the early potatoes and other crops get the benefit owing to the soil around them being looser. I always make a point of keeping the surface of the border over the roots of the fruit trees well moved with the Dutch hoe, and so let in the air and water in a natural way. Geo. Garner.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

VANDA TERES.—There are few orchids more useful and attractive than this species. The plants cannot be regarded as difficult to grow, for there are none of the orchids that will submit to artificial cultivation more readily than V. teres, but difficulties are frequently experienced in inducing the plants to flower satisfactorily; in fact, unless the plants can be submitted to suitable conditions, they may be grown for years without ever showing signs of a flower. Where a house, or a portion of a house, can be set apart for their cultivation, so that the plants can be placed in a position where they may obtain the full benefit of all the available light, flowering is generally satisfactory.

POTTING.—V. teres requires to be repotted or top-dressed annually, for the dry state of the potting compost during the prolonged resting period usually causes the sphagnum moss to die, thus necessitating top-dressing. The best time to attend to repotting is immediately after the plants pass out of flower. Where the plants are placed at the end of a span-roofed house with a southern aspect, or in a position where they may be trained near the roof glass, they are well suited by being planted in boxes or troughs. These should be amply drained with clean broken crocks. The potting compost should be of about equal proportions of peat or osmunda fibre and chopped sphagnum moss, intermixed with a liberal sprinkling of broken crocks or charcoal to retain it in an open and porous state. It will be found that some of the plants will annually become leggy through the loss of the lower leaves, so that when repotting is done the stems should be cut down, so as to keep the roots in the potting compost. Thoroughly water as soon as repotting is completed, shade the plants for a few days afterwards, and freely syringe overhead, and maintain a hot, humid atmosphere. As soon as they have recovered from the effects of repotting, afford the plants full advantage of the sunshine.

RESTING.—A saturated state of the atmosphere must be maintained throughout the growing season, but as soon as the growth reaches maturity, water should be gradually withheld, and for about a period of four months no root moisture is necessary beyond an occasional syringing to keep the terete stems and foliage plump. The dry conditions must be maintained until the flower spikes make their appearance, and then the necessary encouragement to produce flowers must be afforded.

TEMPLE SHOW.—MAXILLARIA SANDERIANA (MESSRS. J. CYPHER AND SONS).
A distinct and handsome species.

PROPAGATION.—To increase the stock, lay the ends of the stems that have been removed on a bed of sphagnum moss, or even on the surface of the boxes in which the plants are growing, they will generally produce new growths in due course, which may be potted and grown on in the usual way as soon as new roots make their appearance.

VANDA HOOKERIANA is worthy of every consideration, and is a most desirable companion for V. teres. The hybrid V. Miss Agnes Joachim has a robust constitution, and must have full exposure to the sun to induce it to flower in a satisfactory manner. The cultural conditions otherwise are the same as that required for V. teres.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

FERNS.—The ferns that were repotted early in the year will have their pots now well filled with roots, and will benefit by applications of weak liquid manure; to further the development of the fronds, give plenty of space between the plants. This will also prevent damping.

ADIANTUMS required for cutting should be removed to a slightly cooler house. The late adiantums should have been repotted and then placed in a cool house, and not syringed overhead. These cool-grown plants are better for supplying fronds than others grown in much warmth, and a number should always be kept in reserve. During bright sunshine ferns will now require to be shaded, but the shading should be partial. Perpetual shade will soon spoil the plants.

FERNS IN HANGING BASKETS will now require abundance of water to keep them in good condition, frequent soaking in a water tank being necessary. Any refurnishing of baskets that was overlooked should be given attention, and a moist house will be necessary for a short time. There are many species of ferns that make good basket plants, such as davallias, Nephrolepis davallioides, N. exaltata, N. tuberosa, and others, and moisture in the growing season is of the utmost importance to all.

TREE FERNS, such as dicksonias, lomarias, alsophillas, and cyatheas, throwing up their fronds, should have their stems syringed several times daily, thoroughly wetting every part to encourage growth. Remove unsightly fronds to make room for the new ones. Bind sphagnum moss round the stems of sickly plants to encourage new roots.

GYMNOGRAMMAS, when growing freely suffer if syringed. They do well in the driest and warmest part of the house. Slugs are very troublesome, and destroy the young growths, if not diligently looked after and killed. Collect and pot the small plants often found growing on walls, etc. Pteris serrulata should be grown in a cool house if the fronds are intended for cutting, as these are then more lasting. Diluted liquid manure frequently applied to the more robust species will benefit them.

CLOSE ATTENTION will now be necessary to the inmates of the stove. Although the winds may be cold the sun is powerful, so careful shading and ventilation will be necessary. Avoid cold currents of air by only using the top ventilators, and to correct injurious dryness frequently damp and syringe, and keep the evaporating pans full. To check red spider and thrips, throw plenty of water about at closing time, and again in the evening, if thought necessary. Crotons will now need copious supplies of water and weak liquid manure. Palms not repotted should be assisted with weak liquid manure to give the new leaves strength. Dracænas, aralias, and all similar plants that have filled their pots with roots, if intended for large specimens should be repotted. Frequent sponging is necessary to keep them clean.—W. Fyfe, Lockinge Gardens.

FRUITS UNDER GLASS.

PEACHES AND NECTARINES.—The fruit of trees that were started in the beginning of the year will now be nearly [illegible], especially such varieties as Hale's Early [illegible] Alexander peaches and Early Rivers [illegible] Cardinal nectarines. Plenty of air [illegible] now be admitted, as free ventilation [illegible] help to give good flavour. Syringing [illegible] be discontinued over the fruit, but the [illegible] and floor should be kept damp. On no account neglect the watering of the borders, but if the borders have been kept in [illegible] condition they will not require much [illegible] till the crop has been gathered. As soon as this has been done a good watering will be necessary, and the foliage syringed [illegible] daily, as it is essential to keep the [illegible] clean and healthy. In gathering the [illegible] avoid damage by undue pressure, [illegible] they are gathered place in a box or [illegible] containing a layer of wood wool, over [illegible] should be placed soft tissue paper, [illegible] place in a clean, cool room free [illegible] They are best when used as soon after gathering as possible. Trees in succession [illegible] must be kept thoroughly well syringed and watered, and the young shoots [illegible] The houses should be ventilated [illegible] fine mornings, and the ventilation gradually increased, so that any sudden rush of air is carefully avoided. The borders may receive a good dressing of guano or some approved artificial fertiliser, and a mulch of manure from the farmyard will be beneficial, especially if the borders are subjected to much sunshine. Where the borders are shaded by the trees a mulch is not important.

TEMPLE SHOW.—NEW AMARYLLIS (MESSRS. R. P. KER AND SONS).
New varieties of a fine strain of these handsome bulbous plants.

ORCHARD HOUSE TREES. — Where trees of various kinds are being grown in pots, and are not plunged, it will be necessary to attend to the watering twice daily as any shortage in the supply may ruin the crop, but when the pots are plunged they do not require such frequent waterings, and syringing should be done whenever practicable. Keep cherries and plums free from aphis, and this is best accomplished by syringing.

MELONS.—Plants ripening their fruits will now require less water. The fruits should be cut as soon as ripe or they will crack. One can generally tell by the odour and by the stem showing signs of parting from the fruit. Plants in successional houses should be well syringed and shut up in the afternoon with a good sun heat; if the temperature runs up to 95 degrees no harm will be done. Melon plants that are being prepared for frames should be put out as soon as ready.

EARLY VINERY.—Where the crop is approaching maturity, as it should be if the vines were started at Christmas, a little air should be constantly admitted both at the top and bottom, to prevent sweating. Damp the floor and walls to keep down red spider.

MUSCAT HOUSES.—Muscats have set well, and are going away rapidly. In the thinning take away all small imperfect berries, and cut the footstalks close. Try and make one thinning suffice, as better shaped bunches are secured by this practice. Close the house early, and shut up with a brisk temperature. Water liberally, and sprinkle a little stimulant on the border and wash in. Damp down occasionally with [illegible] water, and give air early in the morning. Stop all laterals at the first joint.—F. A. Cook, Leonardslee Gardens.

THE KITCHEN GARDEN.

WINTER BROCCOLI, KALES, ETC.—If seed was sown as advised, the young plants will have attained their rough leaves, and be large enough to prick out from the seed bed. Select a well-tilled and sweetened soil that has not previously been cropped with this class of plant, at least for a year or two. Allow six inches between each plant, and arrange the varieties and quantities of each, as far as can be judged, to meet the requirements of the household. Till root action has commenced in the new soil give careful attention to watering to avoid check from undue flagging of the leaves.

CELERY.—The main sowing that was made in March, and the young plants later pricked out in cool frames, will, in many cases, or at least during the next week or so, be ready for planting out in the trenches. This is much better carried out before the plants are too large and become drawn up weakly. Previous to lifting them give a thorough soaking of water to the roots, and carefully retain a ball of earth to each. Plant moderately firm, and give another watering to settle them in their new quarters. If the weather is hot and bright a slight shade will be of benefit for a few hours during the middle of the day, and a sprinkling of water over their leaves late in the afternoon will also assist them to stand the check from the transplantation.

LETTUCES.—Seeds will require to be sown frequently, and in cool quarters of the garden, for the next two months at least. North borders are invaluable during this season of the year in producing succulent lettuce. Make the soil rich, and give ample moisture at the roots during their growth. Cos lettuces are much more satisfactory during the summer than the cabbage varieties, as they travel better if sent away, and they are not so liable to become limp in the salad bowl.

SPINACH.—A sowing of this valuable vegetable should be made every fourteen days, to guard against a scarcity, as, being so subject to bolting during hot weather. Sow in a deep, rich soil, thin the plants early, and apply water plentifully when the weather is dry. A supplementary crop to this, of the perennial spinach, is of value in case of failure of the above, and if a sowing has not been made during this year it is advisable to make one to replace the older sowings.

SECOND SOWINGS OF CAULIFLOWER.—These plants will now be about ready to plant out in succession to the earlier plantings, and if all things go well will form a supply till the Walcheren and Autumn Giant varieties turn in. Give the plants liberal treatment, with good soil, and assist them into growth by frequent applications of water if the weather continues dry, till they are established again.

GENERAL REMARKS. — The forcing ground will have accomplished its purpose by this, and such crops as potatoes, carrots, etc., remaining may now have the lights entirely removed. If necessity requires it such crops as cucumbers and melons may be obtained from the frames before they are again required for the protection of crops in the autumn. Should they not be required, have the lights carefully stored away. Clear away any protecting material remaining round the heads of seakale stools and rhubarb crowns, and prick in about the roots a dressing of rotten manure to invigorate them.—Chas Flack, Cholmondely Castle Gardens.

TEMPLE SHOW.—CALTHA PALUSTRIS TYERMANI (MESSRS. R. WALLACE AND CO).
A dwarf golden-yellow marsh marigold, of much value in the bog garden.

NEW PLANTS, ETC.

◆

ROSE THE LYON.

This new rose promises well, and was a striking feature at the White City in 1908. The colour is delightful, but difficult to describe. Deep reddish rose is the basal colour, and the inner side of the petals is flushed with salmon-buff or apricot. In the bud state the colour is deep reddish-apricot. A.M., R.H.S., May 18. Messrs. T. Rochford and Sons, Turnford Hall, Broxbourne, and Messrs. Hugh Low and Co., Enfield.

RHODODENDRON SOULIEI.

This is a beautiful low-growing Chinese species, with deep green leaves, that at first, together with the young growths, are reddish. The flowers are very large, flattish, bright rose-pink, with red shading. Some of the flowers shown were almost four inches across. Perfectly hardy, and growing about a foot high, this should prove an admirable plant for the rock garden or for bordering larger-growing kinds. F.C.C., R.H.S., May 18. Messrs. James Veitch and Sons, Chelsea.

ODONTIODA VUYLSTEKEÆ CRAWSHAYANA.

A very handsome and distinct variety of the cross between Odontoglossum Pescatorei and Cochlioda Noezliana. It has finely-formed flowers, and is of a deep clear crimson-scarlet, with a golden crest. The colouring is not broken up, as in the original hybrid that caused such a sensation a couple of years ago. F.C.C., R.H.S., May 18. De Barri Crawshay, Esq., Rosefield, Sevenoaks.

SAXIFRAGA DECIPIENS MISS WILLMOTT.

Another useful and distinct saxifrage, with large white flowers borne on dark red-brown stems. The base of each flower is marked with red-brown. This variety is apparently a strong grower: it certainly flowers with great freedom, and is very attractive. A.M., R.H.S., May 18. Messrs. Bakers, Wolverhampton.

TULIP THE PRESIDENT.

A very handsome May-flowering tulip, with shapely elongated blooms of a rich bright red colour, suffused with orange. The base is dark, and expanded flowers are very beautiful. A most effective variety. A.M., R.H.S., May 18. Messrs. R. Wallace and Co., Colchester.

PRIMULA BULLEYANA.

A tall-growing Chinese species collected by Mr. G. Forrest. It has leaves like those of a polyanthus, and tall, erect, whorled spikes of orange-yellow flowers. The latter are not very large, but they are freely produced. We figured this interesting new species on p. 403. F.C.C., R.H.S., May 18. Messrs. Bees, Lim., Liverpool.

STRAWBERRY GEORGE MONRO.

This new strawberry may be described as a very early and exceptionally free-fruiting Royal Sovereign. It is useful alike for forcing and outdoor culture. A.M., R.H.S., May 18. Mr. H. Staples, Swanley.

TEMPLE SHOW.—RHODODENDRON SOULIEI (MESSRS. J. VEITCH AND SONS).

A new Chinese species. F.C.C., R.H.S. Flowers bright rose-pink.

DESCRIPTIVE FERN NAMES.

As enquiries occasionally reach me which indicate a need for a little guidance as to principles which rule, or ought to rule, the naming of varietal forms of ferns, some of which are now and then sent to me with names which are not properly applied at all, I venture to cite a few points germane to the matter.

Varieties fall roughly into three categories, viz., crested or tasselled, plumose or extra feathery, i.e., more divided than the normal, and curios, or forms varied eccentrically. The crested section varies greatly in degree of terminal tasselling or branching, from a mere forking of the tips of the fronds to a repeated branching from the base, which may transform the normally flat frond into a mass resembling a ball of moss. This section may be graded as follows: Furcate, digitate, multifid, or polydactylous; these terms should only be applied when the divisions do not divide again, the tassel being flat, and the divisions pointed. Cristate, percristate, and grandiceps, apply in their order (1) to crests in which the strands of the tassels terminating the fronds and side divisions divide again into minor tassels; (2) to forms where the pinnules or tertiary divisions are tasselled; and (3) when the terminal frond tassel is very heavy. Corymbiferous may fit when the crests are bunchy rather than fan-like. Ramose forms, in which the main rachis or midrib of the frond divides so as to split it up into secondary fronds, may be indicated according to the extent of the branching, as ramosum or ramosissimum or ramulosissimum, while if this branching be associated with terminal division as well, the prefix "ramo" may be applied to the other descriptive terms, thus: ramo-digitatum, ramo-cristatum, or alternatively, cristatum-ramosum, percristatum ramosum, and so on.

By attention to these gradational terms a fair idea can be conveyed of the tasselling or branching character, and this, when associated with other characters, such as the plumose or extra feathery types, which owe their beauty primarily to an extension of the frond division on otherwise normal lines, so that a once-divided or pinnate fern becomes bi, tri, or even quadripinnate, may be conjointly indicated by prefixing the term "plumosum." The true plumose forms are, however, distinguished by a more delicate or papery texture than the normal, and are usually either quite barren of spores or comparatively so. To indicate greater subdivision, coupled with normal texture, we have, therefore, other terms, such as bi-pinnatum, tri-pinnatum, quadripinnatum, decompositum, and dissectum, and if such forms be crested the descriptive term in that connection can be added.

There are, especially in the Athyria or Lady Ferns, a great number of distinct forms, in which the general shape of the divisions varies, and these variants can hardly be classified. In a general way, however, the adoption of the above rules will cover a very large number of forms, as they constitute a rational guide to the naming of seedlings, which may vary too much from a recognised named parent to receive the same name, and thus [illegible] the purchaser.

The descriptive names, it is to be noted, should be written to agree with the botanical gender of the species, thus: Athyrium f.f. furcatum, Lastrea pseudo-mas furcata, and so throughout the names suggested, to which the English form is given above to simplify description.

Chas. T. Druery, V.M.H., F.L.S.

FIGHTING THE FROST.

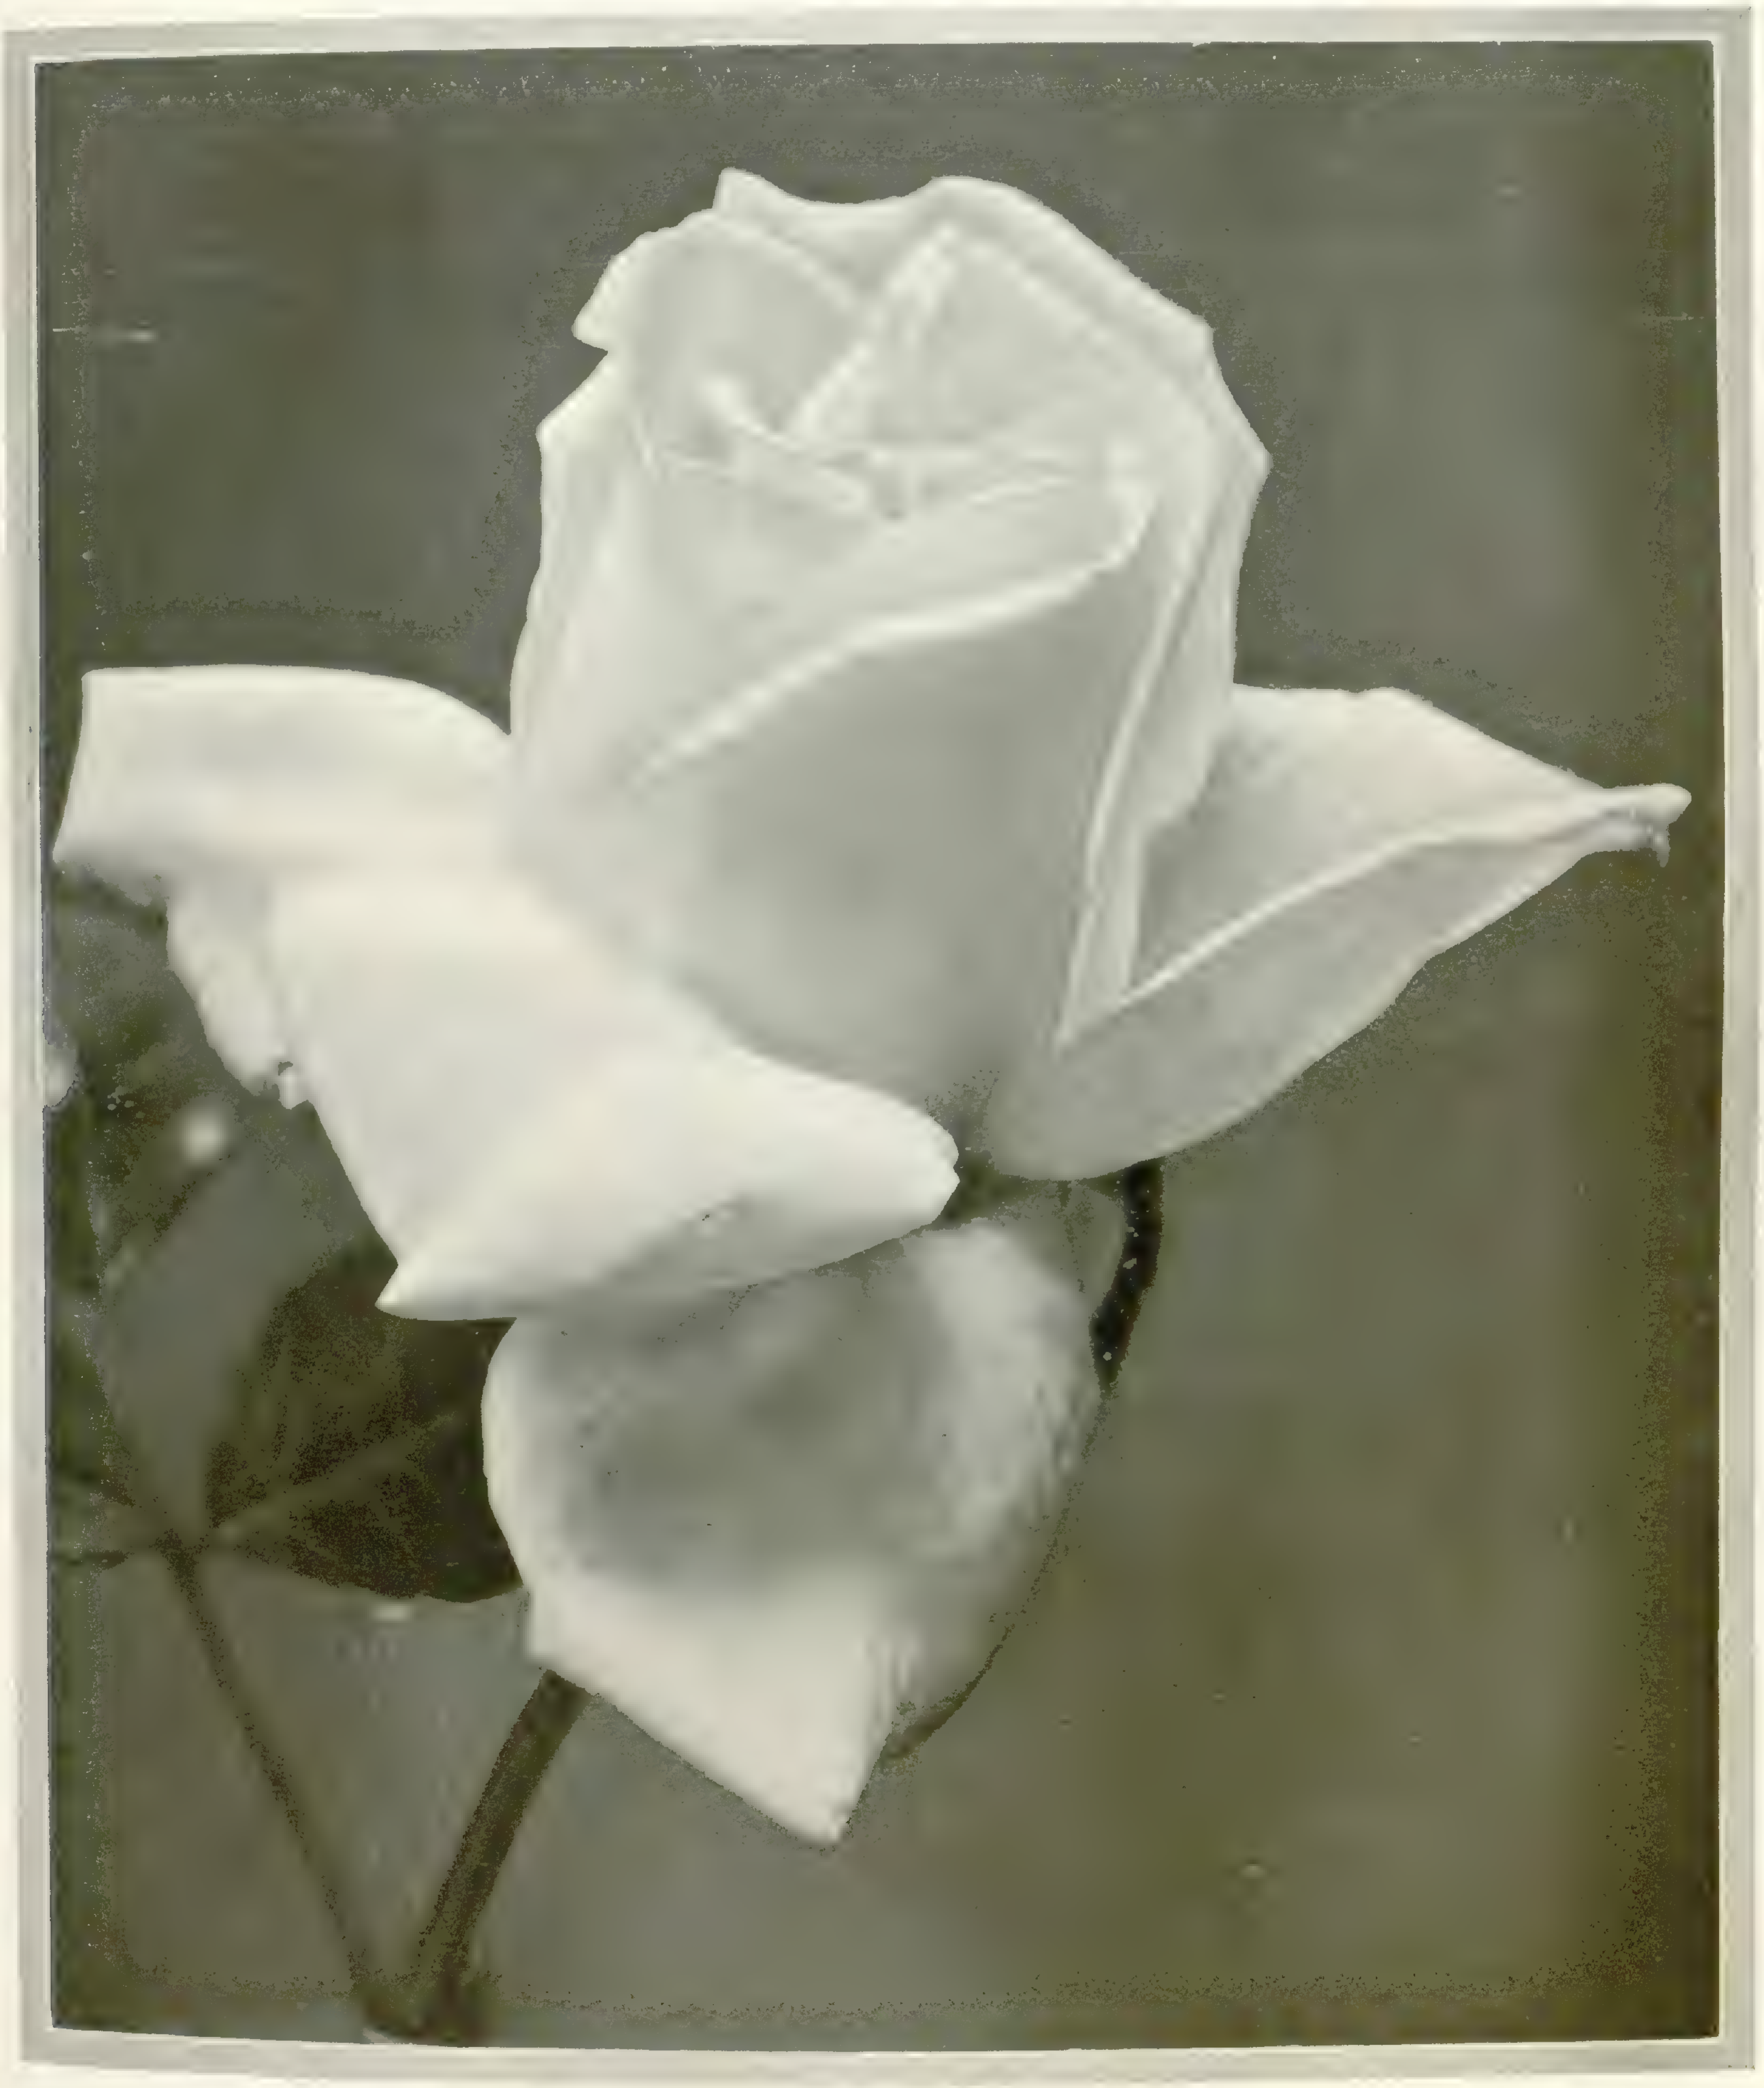
There is scarcely any more potent factor the question of the success or failure of ttempt to grow fruit in this country "Jack Frost," and anything which provide a means of combating its dread ts is at least worthy of the most serious consideration of all who own fruit trees have them under their care.

The economic question as to whether it will pay to incur the expenditure on apparatus and fuel, such as I shall describe, is one upon which we are not prepared at the moment to express a very decided opinion; but I am sure of this, that in private gardens where questions of ways and means are not of such consequence as the production of first-class home-grown fruit, one or other of these systems will be found of inestimable advantage. For several years, both on the Continent and in America, considerable experiments have been tried, with rubbish fires, open coal fires, and even briquettes made from sawdust and crude petroleum.

All who have any connection with gardens are doubtless aware that it is on the clear, still nights that there is danger from frost, and that a cloudy atmosphere is the very best safeguard from its destructive influence.

Following out this idea, fires of rubbish were lighted round the plantations on the windward side, in order to make a smoky cloud, or "smudge." Considerable difficulty was found in obtaining sufficient material of the right sort for the purpose, and also in preventing such large fires as were necessary from becoming dangerous to the adjacent bushes and trees by bursting into flame, so this method was, after some time, abandoned. Coal was then tried both in heaps on the ground and in iron baskets, the latter being found necessary as considerable draught was needed to make it burn properly.

This latter course was adopted with the idea, not so much of preventing the frost from falling by the use of artificial clouds, as to thoroughly heat up the atmosphere in that particular spot, warding off the frost by means of the increased heat and by the motion of the ascending currents of the hot air, and descending currents of colder. At first this was found very expensive in operation, and recourse was had to mixtures of substances, such as crude petroleum, naphtha, and simil



TEMPLE SHOW.—ROSE ALBATROSS (MESSRS WILLIAM PAUL AND SON).

A fine new ivory-white hybrid tea variety.

materials which give off a fair heat and much smoke when burning, but unfortunately they also gave rise to sticky black smuts, which covered the leaves of the immediately surrounding trees, and also caused considerable inconvenience when operations were conducted anywhere near dwelling-houses. Such substances, it was found, could only be used where there were no other crops to become spoilt by these filthy residues of combustion.

A substance has, however, now been produced, which the inventor claims has none of these drawbacks, and will fulfil all that is required for the purpose of frost prevention. When first lighted, it produces a dense black smoke and considerable heat, warming up the atmosphere, and setting in motion the currents of air. When this has been accomplished, a wet sack is thrown over the fire, whereupon a thick white smoke is produced, lasting for a considerable period, hanging well in the air, and forming an excellent artificial cloud.

The apparatus for using this fuel, called a "pot," consists of an upright cylinder of iron perforated with holes, having in the centre a tube also perforated to act as a draught-producing chimney, the space between being filled with the patent fuel, only the application of a lighted match being necessary to set the latter going.

Since the first trials at Evesham, this "pot" has been made with a hinge in the middle, so as to pack fairly flat and facilitate storage during the seasons when they are not required. Mr. Stainforth, of Evesham, the inventor, estimates the cost of the stoves at £3 per acre, and the cost of the fuel at 15s. per acre, including the labour of putting out the pots and filling. The fuel can be re-used, and is not damaged by exposure to the weather, so that the pots can stand out in the plantation from the first opening of any blossom until all danger of frost is passed without need for any covers or protection of any kind.

Of course, to some extent, the lighting, putting out, and relighting continually of the material, produces some waste, but a little extra can be added at any time.

TEMPLE SHOW.—NEW BEGONIA MRS. JOHN BRINSMEAD (MESSRS. T. S. WARE, LIM.).

A handsome double variety, with finely-formed flowers.

So much for the hanging smoke system. Now, however, there is upon the market a competitive system, depending for its success upon the production of heat, such as we have mentioned above.

A syndicate of Colorado growers, where, by the way, smudging has to be practised to be able, sometimes, to save even the trees, has placed on the market here a "pot" for burning coal, and they maintain that their system is the most efficient. The "pot" consists of an inverted cone of sheet iron, perforated with holes at the bottom, resting in a circular wire stand, supported on three twisted wire legs, and also having a cover which is arranged to stand about three inches above the top of the pot. A piece of waste, saturated with oil, is put in the bottom, then some wood, and lastly 15 to 20 lbs. of coal, and when the cover is put on, the heater is ready for action.

Fifty of these heaters are required to the acre, and at some recent demonstrations at Heston, they were lighted in three minutes by two persons. Temperature readings inside and outside the area were taken, and it was found that the heat was raised 4 degrees, the outside readings being 32 degrees.

At Swanley the work of lighting up was accomplished even more speedily, in 1½ minutes, and, as the general temperature was lower, 30 degrees, even better results were achieved, a gain of 6 degrees being obtained in a little over an hour.

It will thus be seen that it is possible in actual practice to so heat the atmosphere as to ward off frost, but whether the expense of material and labour will be justified by results remains to be seen."

By the use of coal as a fuel, the pots need re-charging each time they are used, and the covers need to be kept on, otherwise the wood and waste might become damp and not light up readily. It is to be hoped that considerable experiments will be made with both systems in actual practice, so that we may know whether heat to drive off the frost, or a hanging smoke to prevent it settling, and also, a point, by the way, which was omitted in reference to Mr. Stainforth's system, to prevent the too-rapid thawing out of the bloom, if it is unfortunately frozen, be the most efficient for use in this country.

Whichever is proved the better system it will be seen from the foregoing remarks that there is now a possibility of fighting frosts, so as to make it possible to grow some of the finer and more tender sorts of fruits, particularly of pears, in the open, with a greater chance of success, and with a considerable diminution of labour to the covering of the trees with mats every night, such as used to be the practice years ago.

Fred. W. Hammond.

Brentwood.

ROSA SERICEA.

This is usually the earliest species of rose to open its blossoms, and it may often be found in flower about the middle of May. It is rather widely distributed through N. India and China, and has been brought into great prominence during the last few years by reason of a very interesting variety with large red spines which has been received from the latter country. The type forms a large bush, 5 or 6ft. high, and 8 or 9ft. across, with cream-coloured flowers a couple of inches in diameter. The spines of this do not exhibit any special characteristics, but those of the variety, which is known as pteracantha, are very large, bright red, and more or less transparent when young. They beset the stems thickly, so that a plant in full growth is a very striking object.

The fruit of both the type and the variety is orange or orange-scarlet, and is very ornamental. Either plant is worthy a position in a shrubbery, whilst the variety is worth placing in a good position on a lawn. To succeed with it rich soil should be provided.

W. D.

Vegetable Marrows.—If the beds are not in readiness for the plants do not delay to make them ready; plant as soon as possible to enable them to grow away without a check, for if allowed to become too pot-bound, or any other way neglected, valuable time is wasted during their recovery. It may be necessary to afford slight protection for a time by placing hand lights over the plants after planting out.—Chas. Flack.

THE GREAT TEMPLE FLOWER SHOW,

MAY 25, 26 and 27.

A glorious rain ushered in the twenty-second great exhibition of the Royal Horticultural Society, held in the gardens of the Inner Temple, by permission of the Treasurer and Benchers. In brilliance, quality, and variety this display was rather better than those that have gone before, though, with the advance in quality and arrangement that has characterised the more recent Temple Shows, it is difficult to say just where the present show is better than others, or even how much it is better.

There were the usual five tents, three close to the Embankment, and two big ones besides. There was also a small overflow tent at the end of the refreshment tent. Altogether there was 13,000 feet of staging space under canvas, and 20,000 space out of doors, and every available inch was fully occupied. Some idea of the immensity of the show may be gathered from the fact that it was nearly ten times as large as the largest show that can be squeezed into the Royal Horticultural Hall.

Notwithstanding the staging space provided, every exhibitor had to be content with about a quarter of the area he would have liked, consequently it comes to this—that the Royal Horticultural Society's prestige is now so great that, if it had command of sufficient space, it could annually hold a show four times as large as the present one. The Temple Show is now a great institution, a fashionable function, a great horticultural gathering, and a national, nay, an international, affair, for from France, Belgium, Germany, Italy, and America come those interested in flowers and plants, and no doubt from other countries also.

The twenty-second Temple Show will long be remembered. Perhaps it will be the last of the series held at the Inner Temple. The restrictions placed upon the society and upon exhibitors have increased of late, until now they have become positively irksome. We grant that the Benchers have done horticulture in general, and the R.H.S. in particular, good service in allowing their pretty gardens to be used for the great show, but, on the other hand, the Benchers, and their families and friends, have had the grandest annual European show made free to them, and the value of the tickets given them for the privilege they grant must be worth, face value, [illegible] £500. No other liquid refreshments but tea and coffee were permitted on the grounds this year, and the outdoor displays, with one exception, were confined to the area adjoining the No. 4 tent, and to a space on either side of the short walk in front of the chambers of the Benchers. The tea tent was moved to the other side of the path from its usual site, and this opened up a considerable lawn space that was good to look upon, and very refreshing. Another restriction imposed upon the society rendered the preparation for the show a difficult matter: it was that no noise should be made from 11 a.m. until 5.30 p.m., lest the Benchers should be disturbed, and so Mr. S. T. Wright, the society's genial superintendent, had to restrain his men during the daytime, and urge them on at night and early morning. We must confess that the extra hours thus imposed upon Mr. S. T. Wright did not appear to have undermined his constitution. These restrictions, and [illegible] seem to point to one thing, i.e., that the Benchers of the Inner Temple do not want the show held in their gardens. But [illegible] want? Well, it is a year from now to next May, and the fates may be kind enough to show the way long before then.

We congratulate the exhibitors on their [illegible], and on the results achieved, and we heartily [illegible] our meed of praise to those who have had to bear the brunt of the great task in preparing for and conducting this grand exhibition of horticultural skill. The Rev. W. Wilks, Mr. S. T. Wright, Mr. Reader, Mr. Gaskell, Mr. Harry J. Veitch, Mr. H. B. May, Mr. W. A. Bilney, and others who have helped, have done their work well, and under rather trying conditions, for even the best-tempered of exhibitors is apt to be ruffled when his space is so severely cut down, and when, on arrival, he finds but two entrances available for the bringing of his goods, and these blocked by vans of other exhibitors, and also when his assistants must need go outside the show ground for their much-needed refreshments.

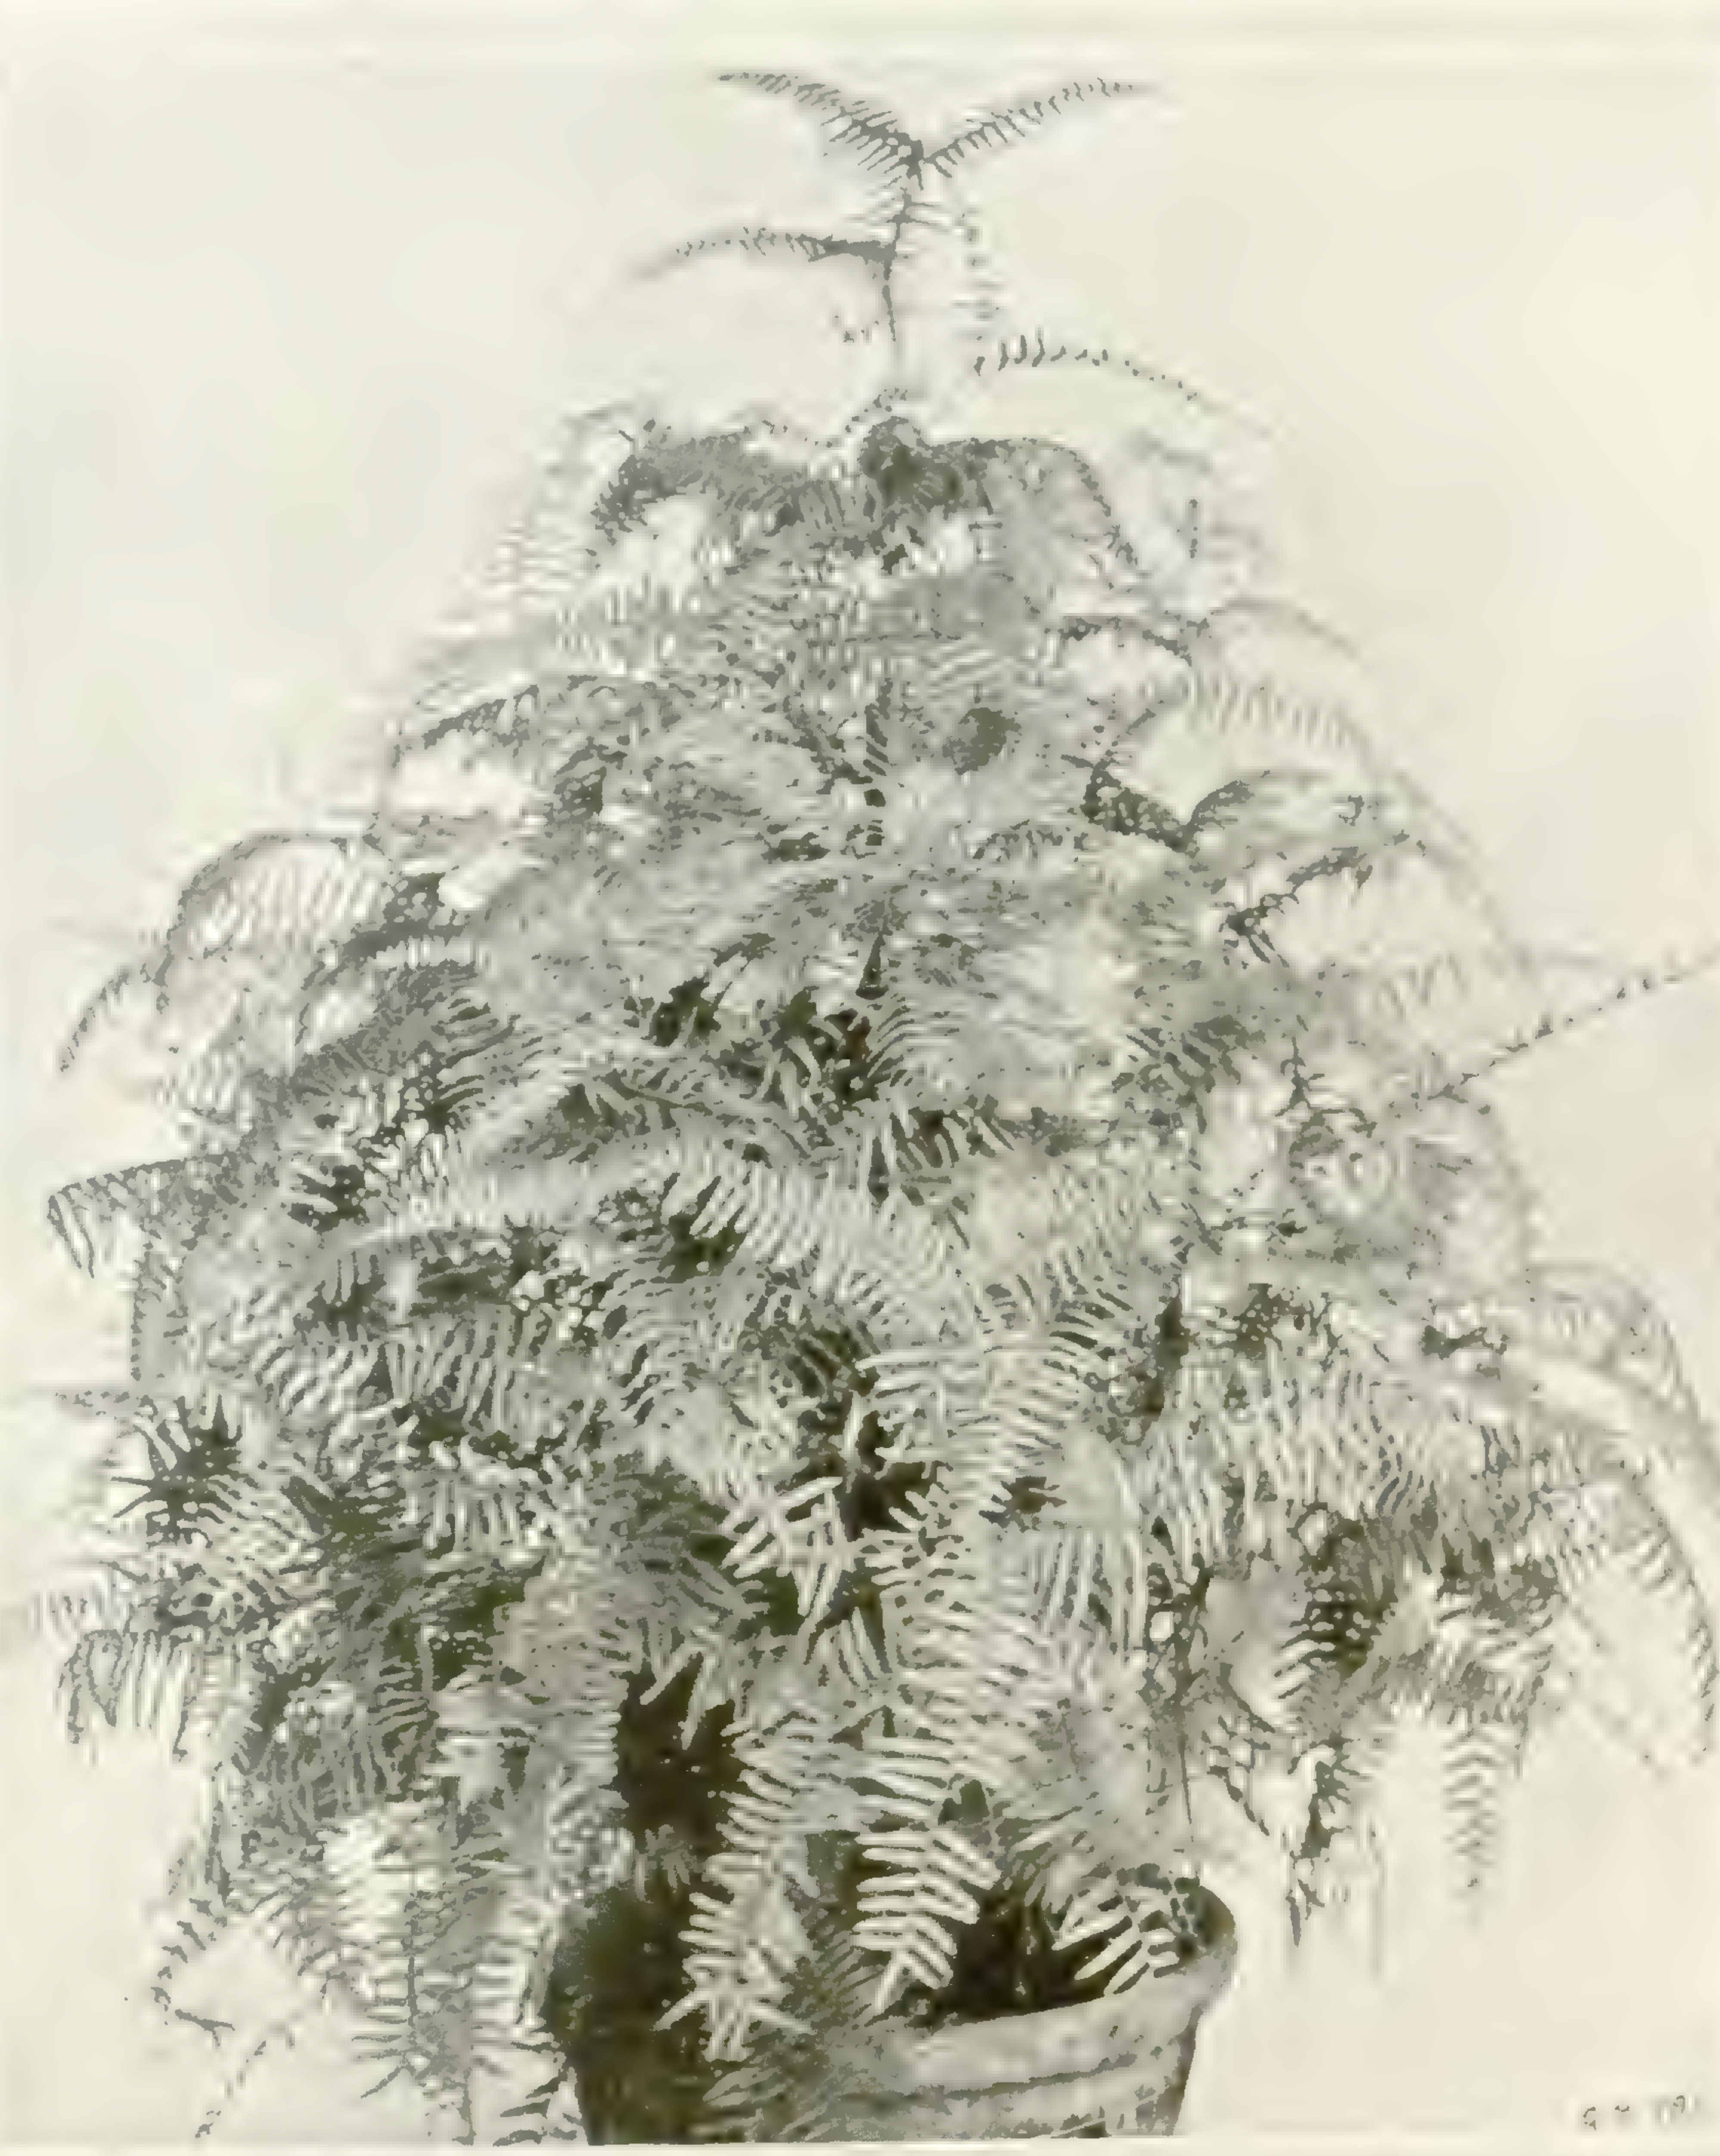
But it was a great show, and one of which Britishers may well be proud. In the matter of novelties there was nothing of transcendent merit or rarity.

ORCHIDS.

The orchids were once again a magnificent feature of the great show, and they filled the great central space in the big tent with their wonderful beauty and colour, and variety of form. Hybrid odontoglossums were a distinct feature.

Mr. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate, occupied a prominent position in the central part of the great tent, and arranged thereon a beautiful exhibit of orchids. The general design was two large mounds or cones, composed of cattleyas, lælio-cattleyas, and miltonias, with odontoglossum spikes arching out from among them. Between these groups the centre of the display was filled in with Cymbidium insigne Sanderæ, bright epidendrums, and a magnificent group of Miltonia vexillaria. Either flank was filled with Cymbidium Lowio-eburneum, C. Lowianum, and odontoglossums in variety, and along the front of the whole display a very large number of interesting orchids were arranged in a setting of moss and asparagus; Epiphronitis Veitchi, the sensitive Bulbophyllum barbigerum, B. Lobbi colossus, Cypripedium callosum Sanderæ, Maxillaria Sanderiana, and many botanical orchids were included.

A magnificent array of choice orchids was very boldly and charmingly arranged by Messrs. Sander and Sons, St. Albans. The group was set out in two big bays, with a bold central mass of orchids between, and high groups at each end. It was a splendid design, and everything was shown up well. Taking the centre first, this was composed chiefly of hybrids of which Lælia (Brassavola) Digbyana is one parent, hence big fringed lips were a feature. L.-c. Digbyana-Mossiæ.



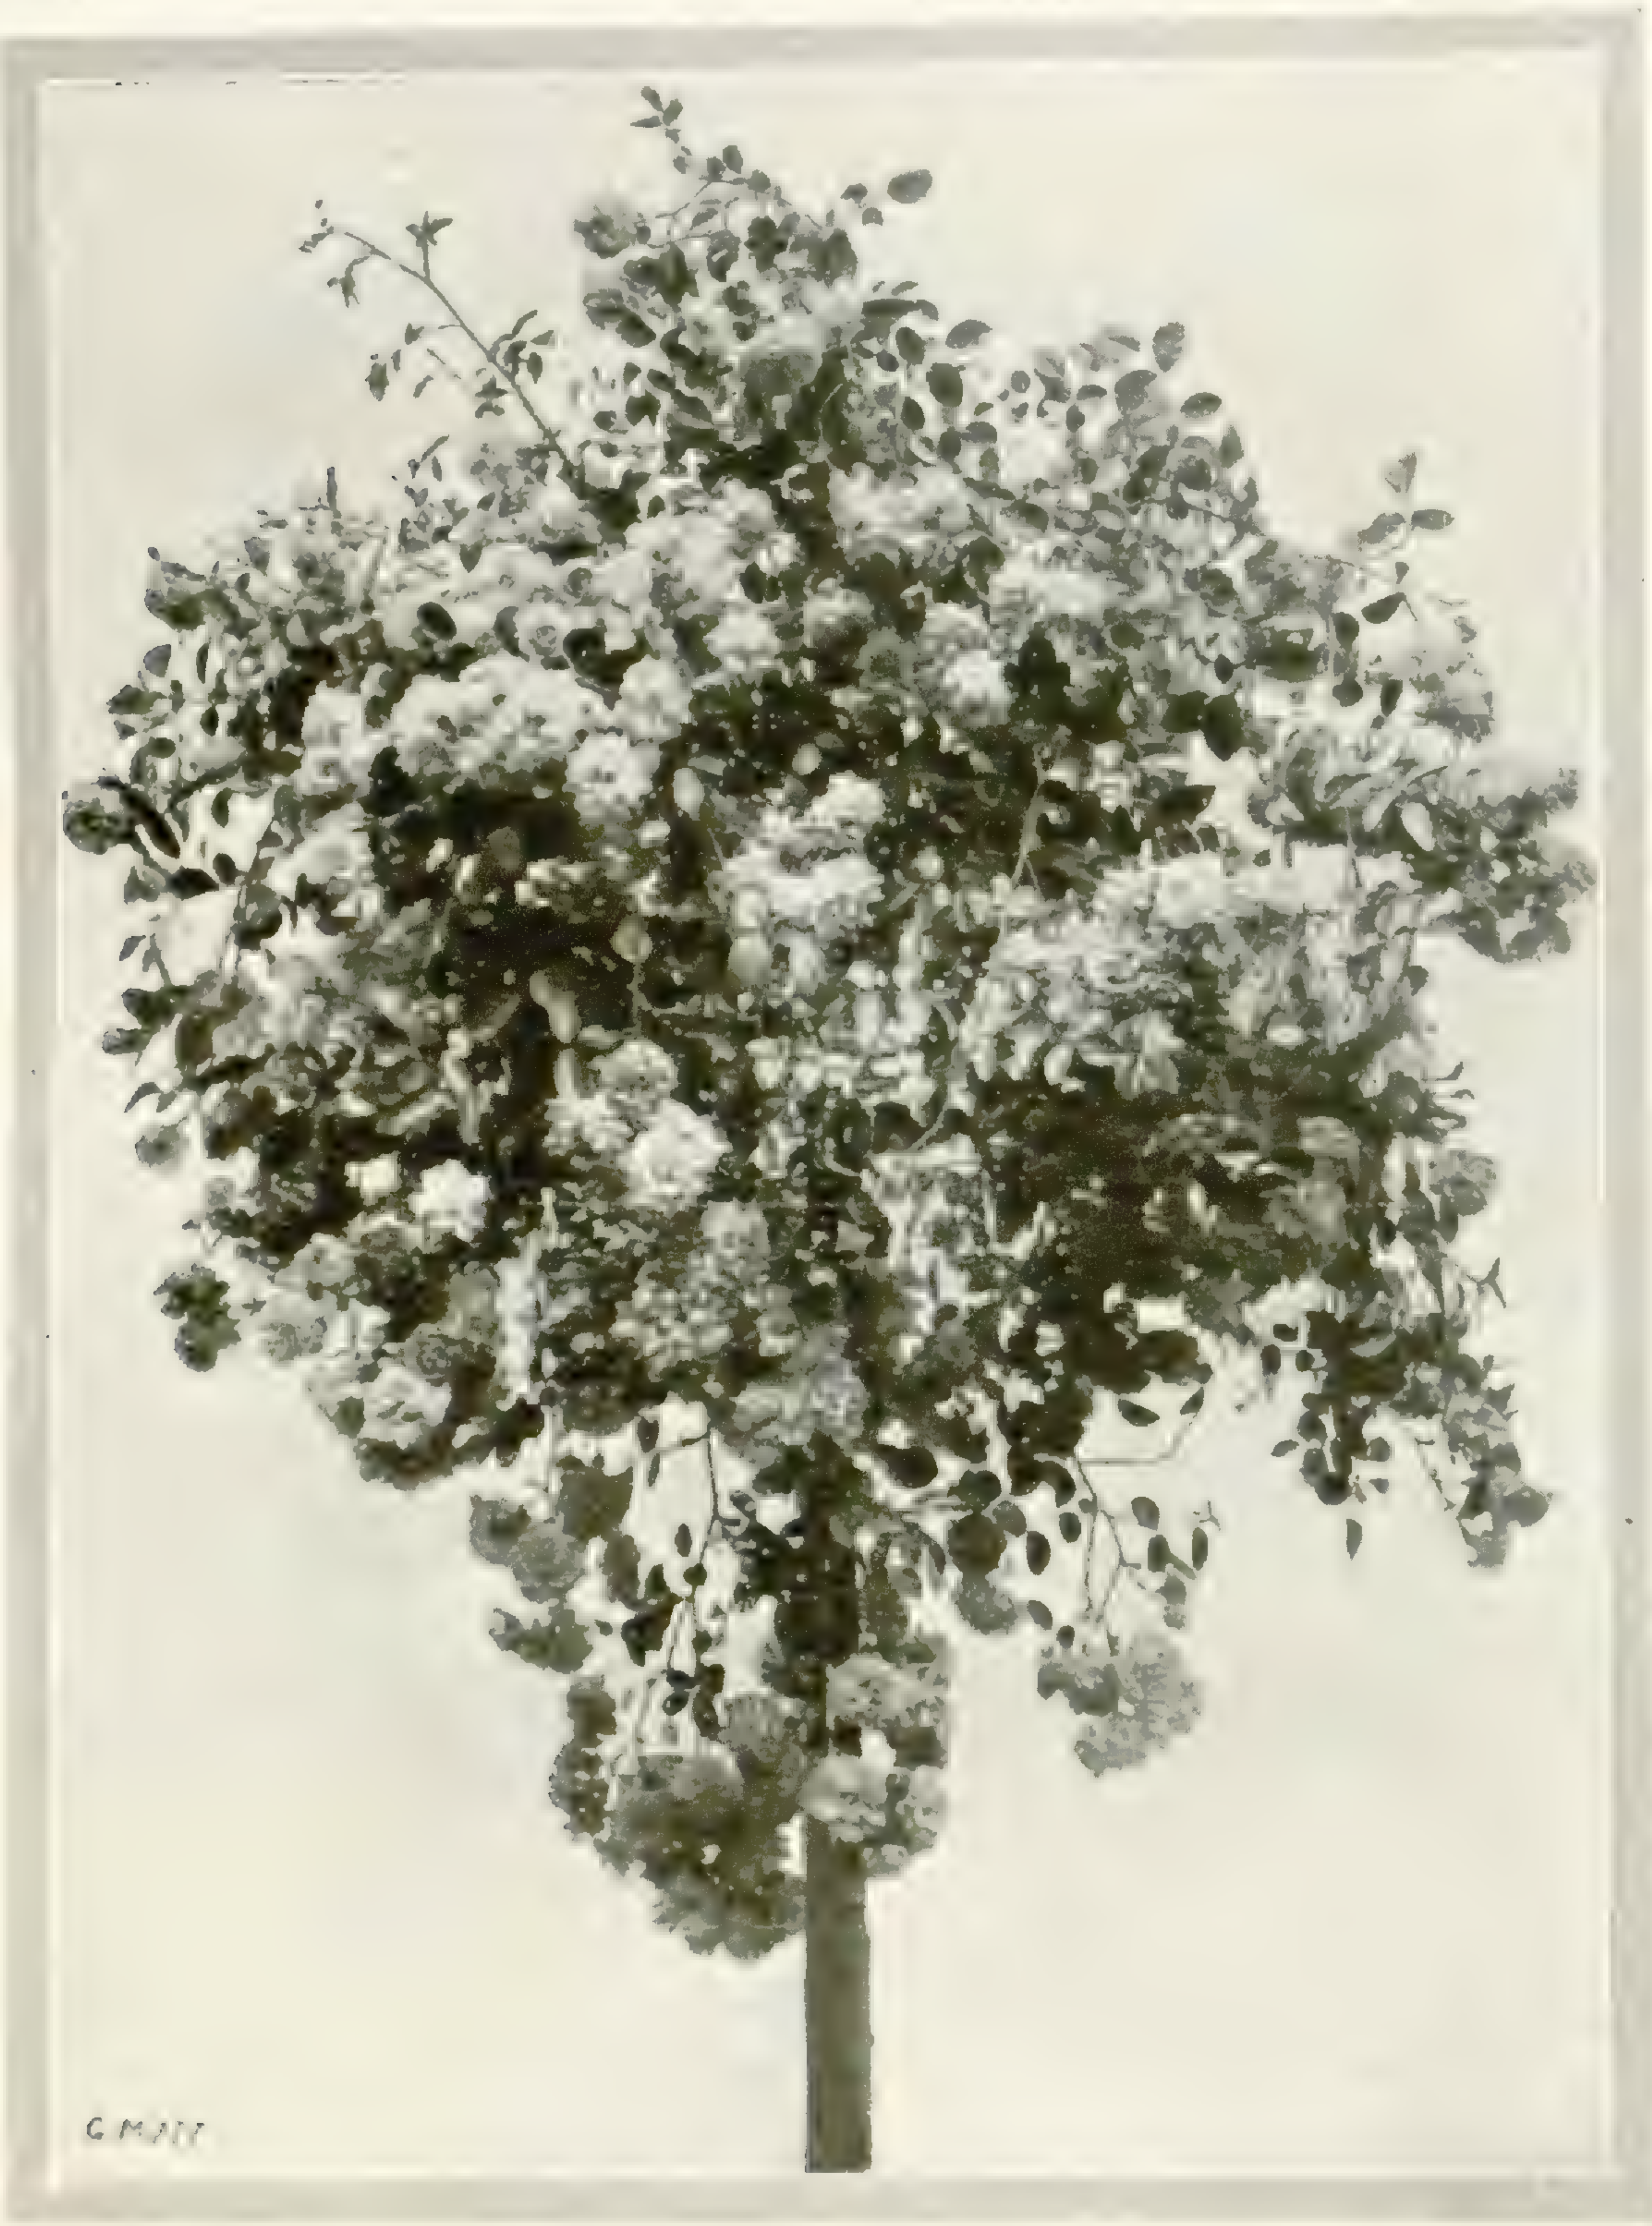
TEMPLE SHOW.—GLEICHENIA RUPESTRIS GLAUCESCENS (MESSRS. J. HILL AND SONS).

A beautiful form of this elegant greenhouse fern.

L.-c. D.-M. Queen Alexandra, and L.-c. Digbyana-Schroderæ, were grandly shown and largely represented. Spikes of Odontioda Devossiana and Phalænopsis Rimestadtiana came well out from among the lælio-cattleyas, and the top of the group was surmounted by a big Cyrtopodium St. Legerianum, surrounded by gorgeous spikes of Oncidium Marshallianum. In the end groups Cattleya Mendeli, Dendrobium thyrsiflorum, and odontoglossums figured largely, and in the bays the choicest of choice things were grouped with a few of the more popular lælio-cattleyas, cypripediums, and odontoglossums. The very beautiful and extraordinary Odontoglossum crispum Solum, that was such a feature of the show two years ago, carried a spike of fourteen blooms; Miltonia Bleueana Mrs. F. Sander, very chaste; Odontoglossum Stella, O. Macnabiana, O. Adriana in great variety, Cattleya Mendeli Mrs. E. Benson, and batches of Cypripedium bellatulum and C. niveum were other notably fine things in this fine group.

A particularly fine group of orchids came from F. Menteith Ogilvie, Esq., The Shrubbery, Oxford, who has now a very large and choice collection of plants. The grace of the very large number of odontoglossum spikes was a feature of the display arranged by Mr. Balmforth, Mr. Ogilvie's gardener. A huge central specimen of Cymbidium Lowianum, and two groups of albino cypripediums were prominent features, these latter including C. callosum Sanderæ, C. Maudiæ. and C. Lawrencianum Hyeanum. The background was of Lælio purpurata, Cattleya Mossiæ, and C. Mendeli; and the front centre was filled in with four plants of the beautiful Cattleya Dusseldorfi, carrying a total of thirty white flowers. Prominent choice orchids along the foreground included Odontioda Vuylstekeæ, O. Bradshawiæ, several unnamed odontiodas, O. Charlesworthi, Odontoglossum luteo-purpureum Vuylstekeanum, O. percultum, a fine O. eximium, and Cypripedium Rothschildeanum. It was a splendid amateur's contribution.

Another big orchid exhibit was the one from Messrs. Armstrong and Brown, of Tunbridge Wells, whose general design was two bays, one on either side of a big mound, and with high flanking ends. Giant specimens of Cymbidium Lowianum crowned the ends, their spikes arching out over lælias, cattleyas, and odontoglossums in great beauty and variety. The centre was a beautiful group of odontoglossums arranged in a bed of light maidenhair ferns. A few of the best of these were O. crispum Trianæ, O. ardentissimum Mrs. Temple, O. percultum, O. Ossulstoni, O. amabile, O. Lambeauianum, O. crispo-Harryanum, and the deeply-coloured O. Armstrongæ. In the little dells there were groups of cypripediums, and here C. glaucophyllum, C. bellatulum, C. callosum Sanderæ, C. Rothschildeanum, and C. grande atratum were all good. A few of the other notably fine things were Lælio-cattleya G. S. Ball, Cattleya Skinneri alba, Brasso-cattleya Veitchi, L.-c. Mercia, Cœlogyne pandurata, Cattleya Dusseldorfi var. Undine, and Dendrobium nobile virginale.



TEMPLE SHOW.—ROSE DOROTHY PERKINS (MESSRS. FRANK CANT AND CO.).

A splendidly developed standard specimen of this beautiful pink rambling rose.

Messrs. Hugh Low and Co.'s contribution, from Enfield, was hardly so well put up as usual, the flower pots were too much in evidence. They had charming varieties of Cattleya Mendeli and C. Mossiæ, and Odontoglossum Pescatorei, Oncidium phymatochilum, Cymbidium insigne Sanderæ, Oncidium pulchellum, and Epidendrum bicornutum and Dendrobium Jamesianum were all represented. Odontoglossums provided the bulk of the display made by Messrs. William Bull and Sons, King's Road, Chelsea, and conspicuous among these were the new seedling O. crispum Minoru, heavily blotched with red-brown. O. c. Mabel, O. c. Mikado, O. c. Diadem, O. Harryano-crispum, O. luteo-purpureum, and Odontioda Chelsiensis were all charming in grace and colour. Dendrobium Wardianum, Cattleya Mendeli, and Cymbidium Lowianum were also freely represented.

Messrs. Stanley and Co., Southgate, presented a small group of odontoglossums and cattleyas. They showed Lælia purpurata The Queen, pure white, and C. Mossiæ vestalis, with white sepals and petals, both of these being very distinct. Mr. J. Robson, Bowdon Nurseries, Altrincham, showed some beautiful forms of Odontoglossum crispum, O. Lambeauianum, other very fine hybrid odontoglossums, and an odontioda, but not anything was named.

Mons. Chas. Vuylsteke, Loochristy, Ghent, brought over a few exquisitely beautiful odontoglossums, and these were O. conspicuum, O. insuetum, O. eximium rotundiflorum, O. Aglaon (F.C.C.), a grand flower, richly coloured with chocolate-red; O. Princess Victoria Alexandra (F.C.C.), with rich red-brown flowers, having every segment beautifully margined with blush white; and O. mirum Emperor of India (F.C.C.), a big red-brown flower margined and marked with white, and with a deep golden crest. All these were wondrously beautiful and distinct.

From his Grace the Duke of Marlborough, Blenheim Palace, came a high-pitched bank of orchids arranged by his gardener, Mr. Hunter. Dendrobium densiflorum was freely used in the background, with Lælia purpurata, and varieties of the latter were set out all over the group, among miltonias and odontoglossums, and with Chysis bractescens, trichopilias, and the fragrant Cattleya citrina. Mr. Gould, gardener to Mrs. Wood, Glossop, put up a collection of orchids, wherein Cymbidium Lowianum, Dendrobium atro-violaceum, Cattleya Mossiæ, Odontoglossum crispum, and miltonias were conspicuous.

A very light and elegant arrangement of orchids was made by Messrs. Moore and Co., Lim., Rawdon, Leeds. Phalænopsis Rimestadtiana, carrying grand spikes of its [illegible] white flowers, formed a telling central [illegible]ture, and fine forms of Odontoglossum [illegible]pum coming from among Cattleya M[illegible] and C. Mendeli made up the corners. [illegible] the foreground, all set out clear from [illegible] another, were Odontoglossum A[illegible]liersense, O. Rolfeæ, O. Phœbe, O. pe[illegible]tum, O. crispo-Harryanum, Odontioda V[illegible]stekeæ, Trichopilia Backhousiana, Ang[illegible] Clowesi, and other good things.

Odontoglossums and miltonias were [illegible] effectively grouped by Messrs. Cyp[illegible] Sons, Cheltenham, and the former [illegible] O. concinorum, O. amabile, O. La[illegible]num, and various new hybrids. W[illegible] were Cattleya Dusseldorfi, Maxilla[illegible]deriana, with its quaint flowers, [illegible] and a fine representation of [illegible] This firm had also a fine set of [illegible] Mossiæ, a big plant of Cypripedi[illegible]childeanum, and a large Stanhopea [illegible]

One of the finest of the many [illegible]rangements of orchids was the [illegible] set up by Messrs. Charlesworth and [illegible] Haywards Heath, who occupied their [illegible] place in the big tent. In their group they had a wonderful variety of subjects, all charmingly associated. The chief plant was Oncidium Charlesworthi (F.C.C.), a grand species with big brown and gold flowers. Odontoglossums were a leading feature, and among these we made special note of O. crispum Queen Maud, the new O. Thompsonianum, a lovely pure white O. crispum, O. Othello Golden Glow, very fine; O. Pescatorei, nd O. P. Charlesworthi, and O. Harryano rispum with three spikes. There were seve- al plants of the beautiful Odontioda Vuyl- tekeæ, O. Charlesworthi, O. Heatonense, and O. lutetia, Lælio-cattleya Eurylochus (F.C.C.) with bright red-buff flowers was very attrac- ve, and the newly-re-introduced Trichopilia ackhousiana was largely shown. L.-c. Gol- n Glory, Renanthera Imschootiana, Brasso- ttleya Queen Alexandra, Cymbidium insigne [illegible], Cypripedium grande, Ærides Houl- [illegible], Cattleya intermedia alba, B.-c. [illegible]tia, and the yellow Sobralia xanthotes [illegible] a few among the many other good [illegible] exhibited.

TEMPLE SHOW.—BEAUTIFUL DOUBLE BEGONIAS (MESSRS. SUTTON AND SONS).

An excellent strain of these gorgeous flowers.

he exquisitely beautiful Vanda teres was [illegible]ntly shown by Mr. G. Reynolds, [illegible] to Leopold de Rothschild, Esq., [illegible]sbury Park, Acton. The whole group [illegible] of this lovely orchid, in pots, in [illegible], and in long boxes, every plant carry- [illegible] of spikes of mauve-pink blooms. his plant is always remarkably well man- aged by Mr. Reynolds, and this was one of best groups of it he has staged. In a tting of maidenhair ferns these orchids red a very great attraction.

Mr. Richard Ashworth, Ashlands Hall, ewchurch, contributed some charming dontoglossums, and a fine plant of Dendro- m Victoria Regina, but unfortunately rdly any of the fine odontoglossums were med.

FLOWERING SHRUBS.

beautiful bank of hardy azaleas was set y Messrs. R. and G. Cuthbert, of South- . A kind of groundwork was formed by s of such telling varieties as A. mollis onse Levallee, A. mollis x sinensis An- Koster, Occidentalis magnifica (new), lentalis delicatissima (new), Glory of Bos- and others. Standing up above these tandard specimens of Comte de Ker- Occidentalis exquisita, Florodora, te de Gomer, and a host of other charm- things. In the top tent also Messrs. thbert had a number of azaleas, which own in pots on the table—not a good the way, to set them off to the best [illegible] one saw the same stamp of [illegible] as in the big group. The single Ghent variety called Fanny took the attention of a good many people.

Pink Pearl was the absorbing feature in the bank of rhododendrons set up by Messrs. J. Waterer and Sons, Bagshot, and never have we seen this telling variety shown in finer form. Other varieties well worthy of mention were Marquis of Waterford, Lady Eleanor Cathcart, Mrs. Holford, Michael Waterer, John Walter, Mrs. E. C. Stirling, Strategist, and Gomer Waterer. With roses on one side of them, and exotics on the other, these rhododendrons did not fail to assert themselves, and were much admired.

Messrs. James Veitch and Sons, Lim., Chelsea, show hardy flowering plants just as well as they show everything else, and their groups are always put up with artistic taste. Right in the middle of this fine exhibit was a display of Wistaria sinensis, with a standard plant of the white form, alba, in front, and there was also well-grown specimens of Hydrangea paniculata grandiflora, Rhododendron Pink Pearl, Azalea Anthony Koster, Styrax japonica, with a few clematises and Wichuraiana roses. Another feature about the group was the pleasing blending of colour.

GREENHOUSE PLANTS.

We should have known, without looking at the exhibitors' name, that the splendid bank of flowers which filled one end of the big tent came from Suttons, because somehow it bore the unmistakable Sutton stamp. In the centre was a mass of Cineraria stellata, flanked on the right and left by glorious calceolarias, and further on, on each side, groups of schizanthuses, with double begonias and gloxinias dotted about here and there. Conspicuous in the exhibit was Sutton's carnation-flaked clarkia—a very pretty thing—and nemesias in variety. As a margin along the front was the greenest of green turf arranged perpendicularly.

The scent of a bank of heliotropes set up by the King's Acre Nursery Company, Hereford, was attractive enough to draw people to it, but this was not everything, as the plants were well grown, and the varieties numerous. Gorgeous is the word that best describes the bank of hippeastrums set up by Messrs. Ker and Sons, Aigburth, Liverpool. There was a wonderful array of varieties, and amongst them were splendid specimens of Bacchus, Scarlet Queen, Monarch, Silver King, Salmon King, The General, Emperor of India, and a host of others.

Turning from hippeastrums we passed to something equally showy in the cannas which came from Messrs. Cannell, Swanley. They were a grand lot, well grown, and well set up, and when we say that all the best varieties in the canna world were represented this says a good deal. Visitors to the Temple Show are familiar with Messrs. Cannell's cannas, but better they have never seen them. The same firm also set up a few plants of Spiræa Peach Blossom, fuchsias of various types, and a compact little collection of phyllocactus, in which the neat flesh-coloured variety German Empress called for favourable comment.

Messrs. Louis Van Houtte, Ghent, set up an exhibit of Gloxinia striata Count J. de Hemptinne, but there was nothing particularly striking about the plants or flowers. Messrs. W. H. Rogers and Sons, Lim., Red

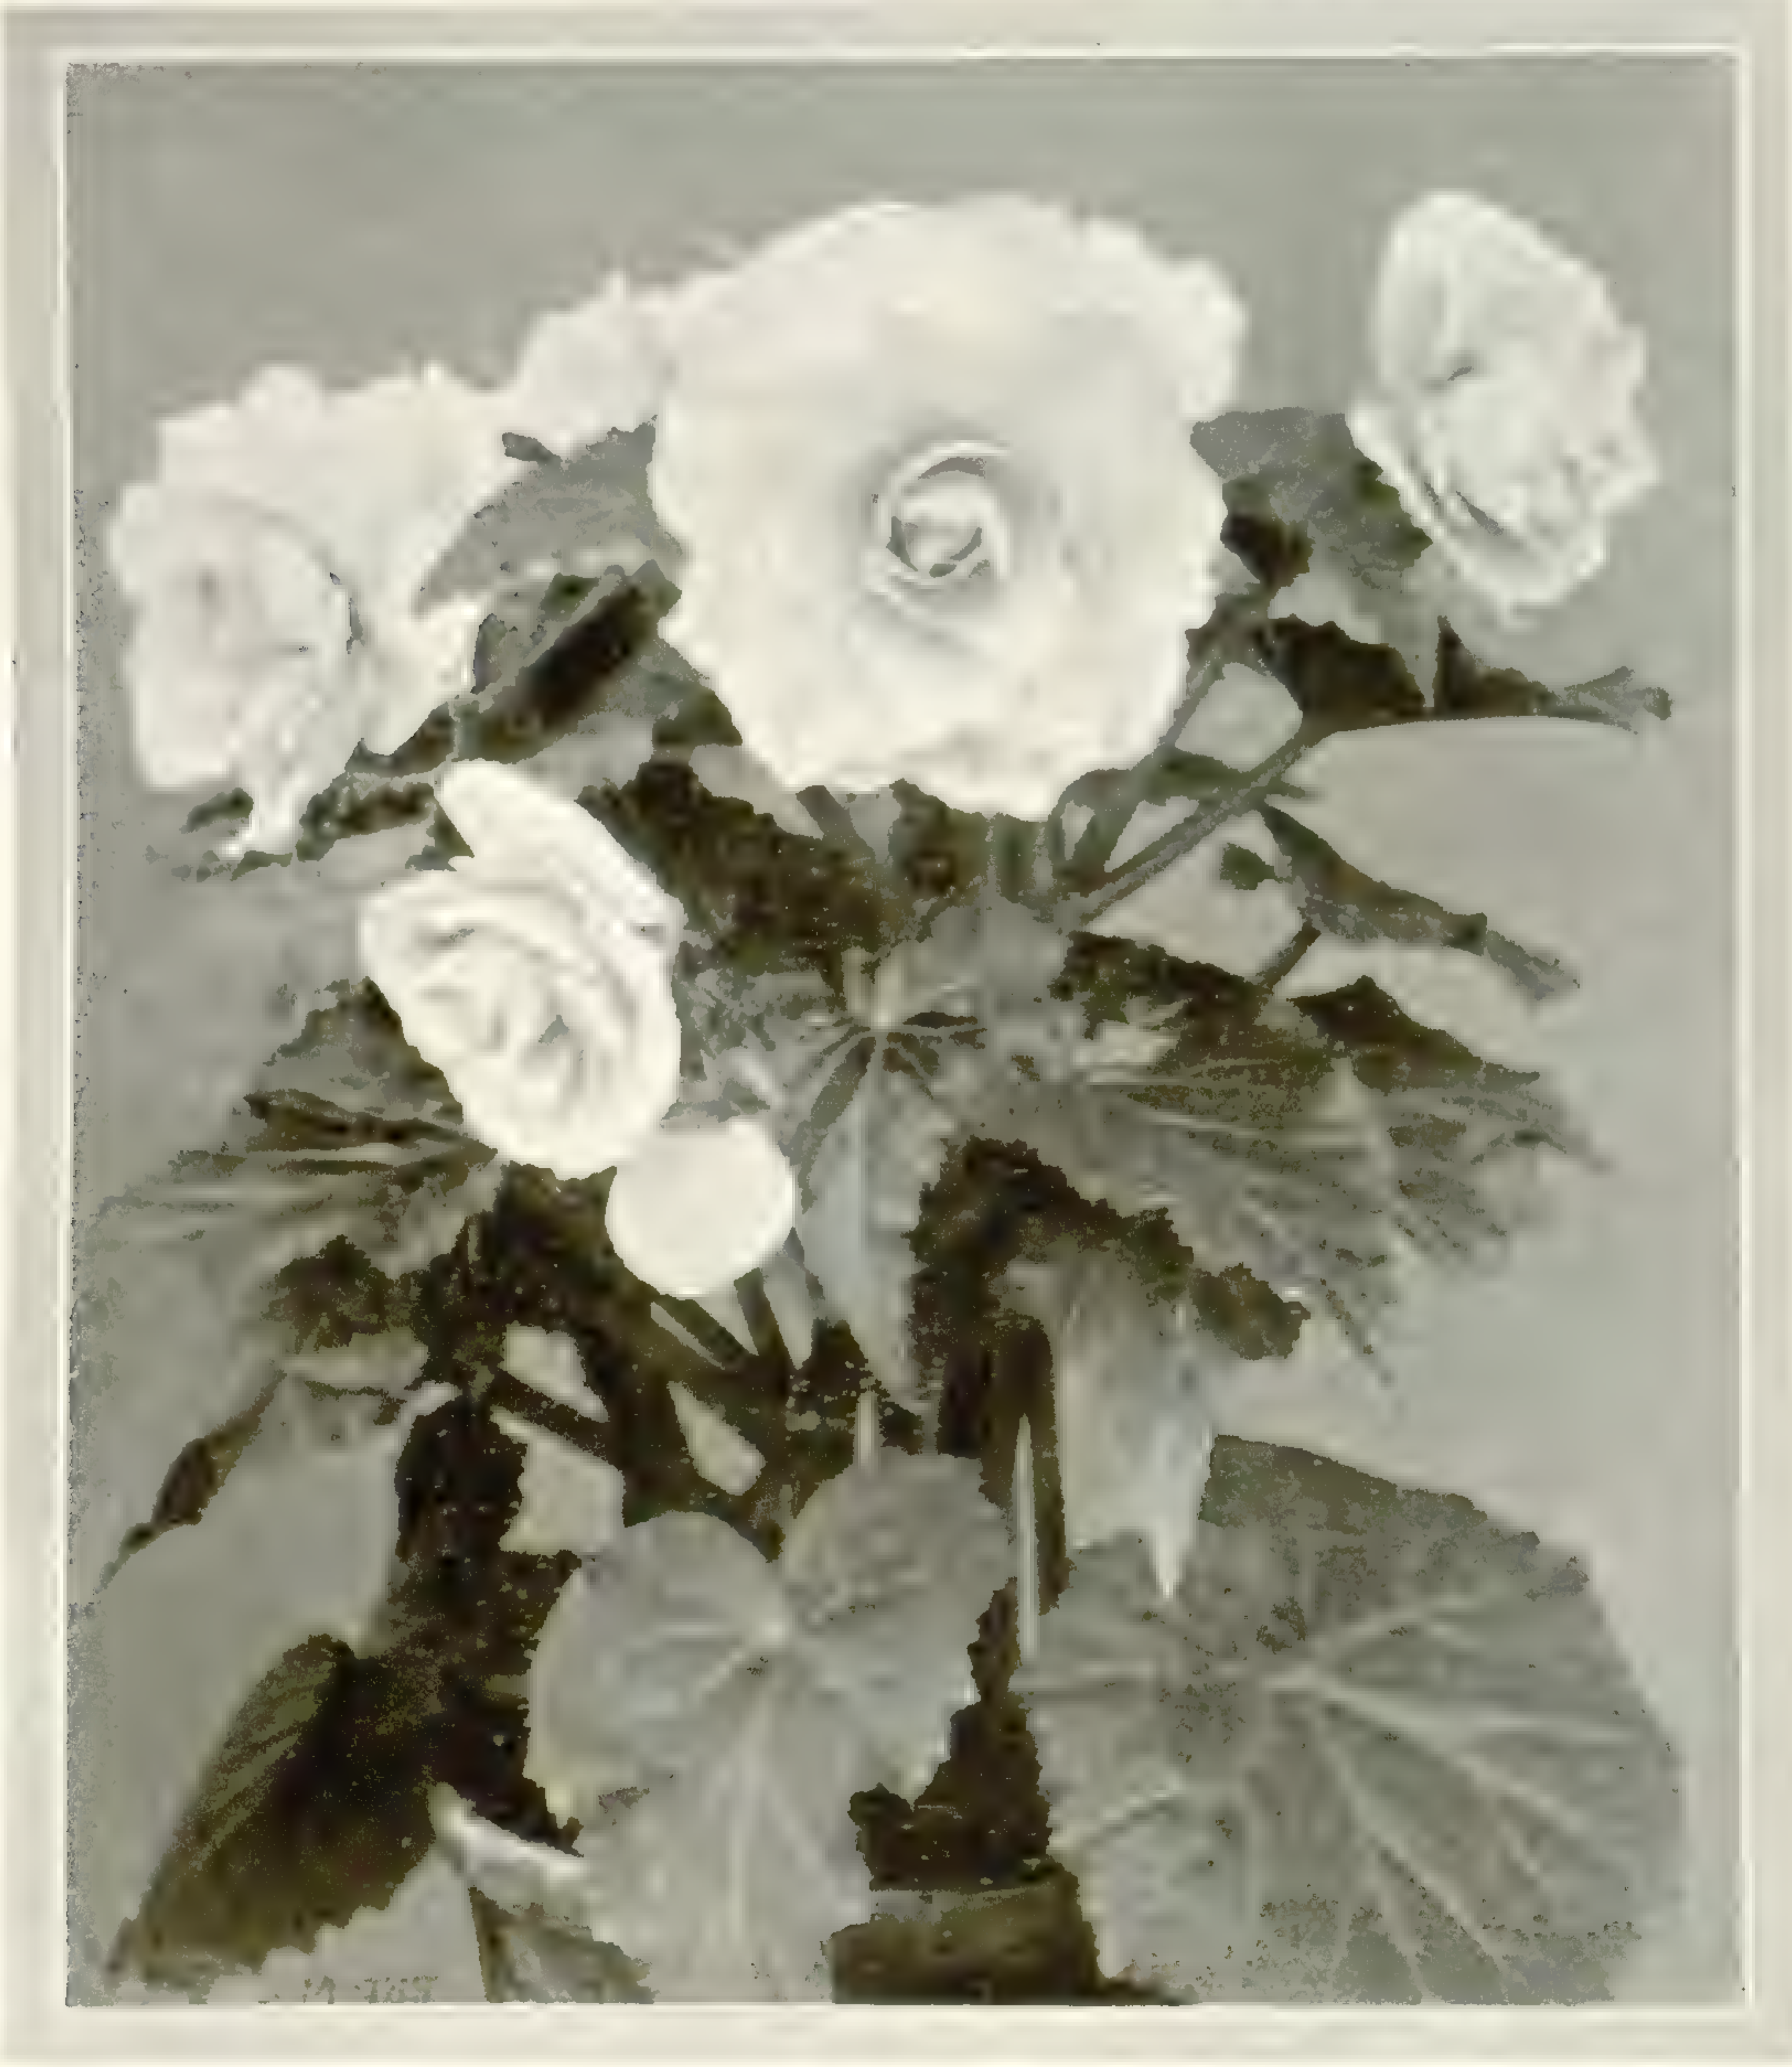
TEMPLE SHOW.—TRICHOPILIA BACKHOUSEANA (MESSRS. CHARLESWORTH AND CO.).

A rare old species, newly introduced. Flowers white and yellow.

Lodge Nursery, Southampton, set up a collection of plants of a new scarlet double pelargonium called James T. Hamilton. The trusses are large, and the habit good.

Wickham Noakes, Esq., Selsdon Park, Croydon, set up some of the best-grown specimens of greenhouse calceolarias that were to be seen in the show. The plants were fine examples of good culture, and reflected credit on the gardener, Mr. W. Howarth. Mr. T. Hobbs, gardener to Vivian Phillips, Esq., Crofton Court, Orpington, also staged a lot of well-grown calceolarias. The flowers were wonderfully fine, and the plants were striking examples of good cultivation.

Fancy pelargoniums seem to have gone nearly out of fashion at Temple Shows, but Messrs. Godfrey, of Exmouth, made an attempt to revive them by setting up a collection of seedling varieties, which included Acquisition, Duke of Devonshire, Ruby, Success, and Exmouth Rival.



TEMPLE SHOW.—NEW BEGONIA MARIE NICHOLAS (MESSRS. BLACKMORE AND LANGDON).

A beautiful double variety with rich pink flowers.

Messrs. J. Carter had a big exhibit of greenhouse plants, which were arranged in what can now be called the typical Carter style. There were well-furnished baskets of schizanthuses overhead, with the same plant in pots beneath, well-flowered gloxinias, and streptocarpuses, cinerarias in variety, double begonias, and a few carnations, all on the centre stage, while in banks in corner recesses of the tent were new Spiraeas Queen Alexandra and Peach Blossom, finely grown cinerarias, Brilliant Prize, and a lot of calceolarias that were perhaps arranged rather too flat.

The Hon. Vicary Gibbs (gardener, Mr. E. Beckett) staged a fine lot of new hybrid streptocarpus, edged with Isolepis gracilis. There was a wide range and pleasing variety of colour amongst the flowers.

Messrs. Hugh Low and Co. had a showy exhibit which contained good specimens of Hydrangea hortensis caerulea, the bottle-brush tree, Pelargonium Clorinda, a few azaleas, schizanthuses, and spiraeas. Bright and brilliant was the display of large-flowered hybrid schizanthuses set up by Messrs. Garaway, Bristol. The plants were well grown and much admired. No more effective exhibit graced the tables in the long tent than the greenhouse plants from Messrs. Veitch, of Chelsea. We were much taken by the delightful little double white pelargonium, with leaves of green and white, and the plants of Lobelia tenuior were much admired. Calla Elliottiana, streptocarpuses of pearly whiteness, cannas in variety, gloxinias, kalanchoes, Cineraria Feltham Bouquet, Cineraria Boule de Neige, Streptosolen Jamesoni, and a number of new hybrid gerberas were included in this interesting exhibit. Nothing in the whole display was more pleasing than the groups of Cinerarias Fairy Queen, Feltham Beauty, and Antique Rose.

From Messrs. W. and J. Brown, Stamford, came an interesting group of plants, which included a charming double white marguerite called Perfection, Verbenas Miss Willmott and King of Scarlets, Lotus peliorhynchus, and Heliotrope Lord Roberts. An attempt to revive an old order of things in the way of trained azaleas was made by Mr. Charles Turner, of Slough. The plants, which were conical in form, had the merit of being not too stiffly trained, so that the charming flowers showed to good advantage. Messrs. Toogood, of Southampton, showed greenhouse calceolarias, which would have looked better if they had been arranged less stiffly.

CLEMATISES.

Once again we have to record a group of clematises from Richard Smith and Co., Worcester, not so large as some we have seen at past Temple Shows, but made up of nicely grown stuff, which displayed a freedom about the training that we like to see. To mention just a few of the many varieties, we were favourably impressed by Sensation, President, Marie Lefebvre, and Willisoni. In the splendid exhibit of clematis from Mr. George Jackman, of Woking, there was the unmistakable stamp of excellent cultivation. The specimens without an exception were well grown, and furnished with beautiful flowers, while the arrangement left little room for criticism. Amongst the varieties the following called forth many favourable comments: Nelly Moser, Fairy Queen, La France, Lanuginosa candida, Mrs. Hope, Mrs. George Jackman, Lady Londesborough, Lady Neville, Henryi, and Princess of Wales. In this exhibit one saw what it is possible to do with these plants when a choice selection of varieties is grown and the cultivation is right.

ROSES.

The Queen of flowers was once more beautifully represented at the Temple Show, and in one corner of the big tent Messrs. Paul and Son, Cheshunt, arranged a superb group of splendidly-grown pot roses. The great feature of the display was the beautiful tall weeping standards of Hiawatha, Dorothy Perkins, White Dorothy Perkins, Lady Godiva, and the new single Buttercup. These fine plants were a trifle crowded towards the back, and needed greater height to display their charms. The groundwork of the group consisted of dwarf plants of Paula, Queen of Spain, Dean Hole, David Harum, Mildred Grant, Mrs. Brocklebank, Wm. Shean, Mrs. A. Ward, Rhea Reid, Lady Roberts, and Richmond and other lovely hybrid tea roses, and over these rose large bushes or standards of Souv. de Pierre Notting, Madame Hoste, Frau Karl Druschki, Princess Charles de Ligne, Maman Cochet, Victor Hugo, and the pretty Goldfinch. Altogether this was a great effort.

A grand group of roses was put up by Messrs. William Paul and Son, Waltham Cross, who, as usual, had superbly flowered specimens of Lady Gay and Dorothy Perkins roses grown in pillar form, and literally smothered in blooms. Other varieties similarly grown and equally well flowered were Crimson Rambler, the glorious Tausendschon, the new single White Fairy, and Philadelphia Rambler. Below these beautiful plants were dwarfs of the newer varieties such as Elaine, David R. Williamson, J. B. Clark, the fine white Albatross, Margaret, Marquis de Sinety, the lovely Lyon rose, Pharisaer, and Mrs. Dudley Cross. It was a delightful display, and showed how beautiful, useful, and popular the free-flowering rambling roses are. Standard roses of such pleasing varieties as Niphetos, Souv. de Pierre Notting, Florence Pemberton, and Madame A. Levavasseur were shown by Mr. Charles Turner, Slough, associated with dwarfs of popular H.P. and H.T. varieties.

Messrs. H. Cannell and Sons, Swanley, startled everyone with their extraordinarily beautiful exhibit of the new rose-pink single rose American Pillar. The plants were very fine, and so also were the specimens of Baby Rambler, Maman Levavasseur, Minnehaha and Dorothy Perkins, but American Pillar overpowered all else in the display.

Messrs. Frank Cant and Co., Braiswick Nurseries, Colchester, had a delightful exhibit of roses, showing the rambling varieties freely. Hiawatha, Dorothy Perkins, Tausendschon, and Minnehaha were very good, and Persian Yellow was a great attraction. Lady Roberts, delightful as ever, occupied the place of honour among the [illegible] flowers, and with this we were [illegible] pressed; also Princess Mertchersky, Marechal Niel, Mrs. A. Ward, Ethel Brownlow, and Souv. de Pierre Notting, J. B. Clark, and White Maman Cochet.

Rambling roses were the great feature of Messrs. B. Cant and Son's rose display in No. 4 tent. Blush Rambler was very charming, and contrasted with Philadelphia Rambler and Crimson Rambler, while the Goldfinch, and Hiawatha added other colours and attractions. Excellent blooms of Frau Karl Druschki, Joseph Lowe, Maman Cochet, and Marechal Niel were also staged in considerable numbers. At the end of the [illegible] of long tents near the Embankment Messrs. Hobbies, Lim., Dereham, set up a large group of roses, and made a great feature of tall standard plants of the rambling roses, and it is surprising what good standards Dorothy Perkins, Minnehaha, Paradise, Seagull, and Lady Gay, make. These standards [illegible] raised high above pillar roses and dwarfs of many kinds, the smallest rose being the little bedding polyantha variety named Apple Blossom, a charming little rose. The "blue" Veitchenblau was also represented.

Once more Mr. George Mount, of Canterbury, staged roses remarkably well, and throughout the whole of the first day it was not an easy matter to get near the exhibit of roses that proved so attractive. The deep green leathery foliage and blooms of Ulrich Brunner, Joseph Lowe, [illegible] Karl Druschki, and Mrs. John Laing [illegible] most impressive, and the flowers were shown on long stalks in Mr. Mount's well-known style. A pleasing background was formed by varieties of the Rambler type, and perhaps the feature of the exhibit was the collection of the new H.T. Rose Joseph Lowe. Captain Hayward was shown in fine form, and altogether it would be impossible to speak too highly of this exhibit.

Messrs. Dickson and Sons, of Nowtownards, [illegible] a choice little collection of new roses, which attracted much attention. Amongst the most pleasing were Margaret Molyneux, Mrs. David Jardine, George C. Waud, Lady Ursula, and Mrs. Cornwallis West.

FRUIT AND VEGETABLES.

There was a distinct touch of familiarity [illegible] the fruit trees in pots which came from Messrs. T. Rivers and Son, of Sawbridgeworth, and they were as good as ever. Tempting [illegible] appearance were the well-coloured fruits [illegible] Nectarine Seedling 101—apparently a [illegible] introduction—while other varieties [illegible] are now well known, including Cardinal [illegible] Early Rivers, showed up well. Amongst [illegible] Peregrine was strongly represented, [illegible] to give variety to the collection was a fruited specimen of Grape Ferdinand [illegible] Lesseps in a pot, Early Rivers and Frog-[illegible] Bigarreau cherries. Altogether the [illegible] was worthy of the reputation of the [illegible]

Rhubarb alone made up the exhibit sent by Mr. T. E. Dawes, Syderstone, Norfolk, and amongst the varieties represented was Dawes' Challenge, of which there was staged a tremendous clump weighing 168lb.

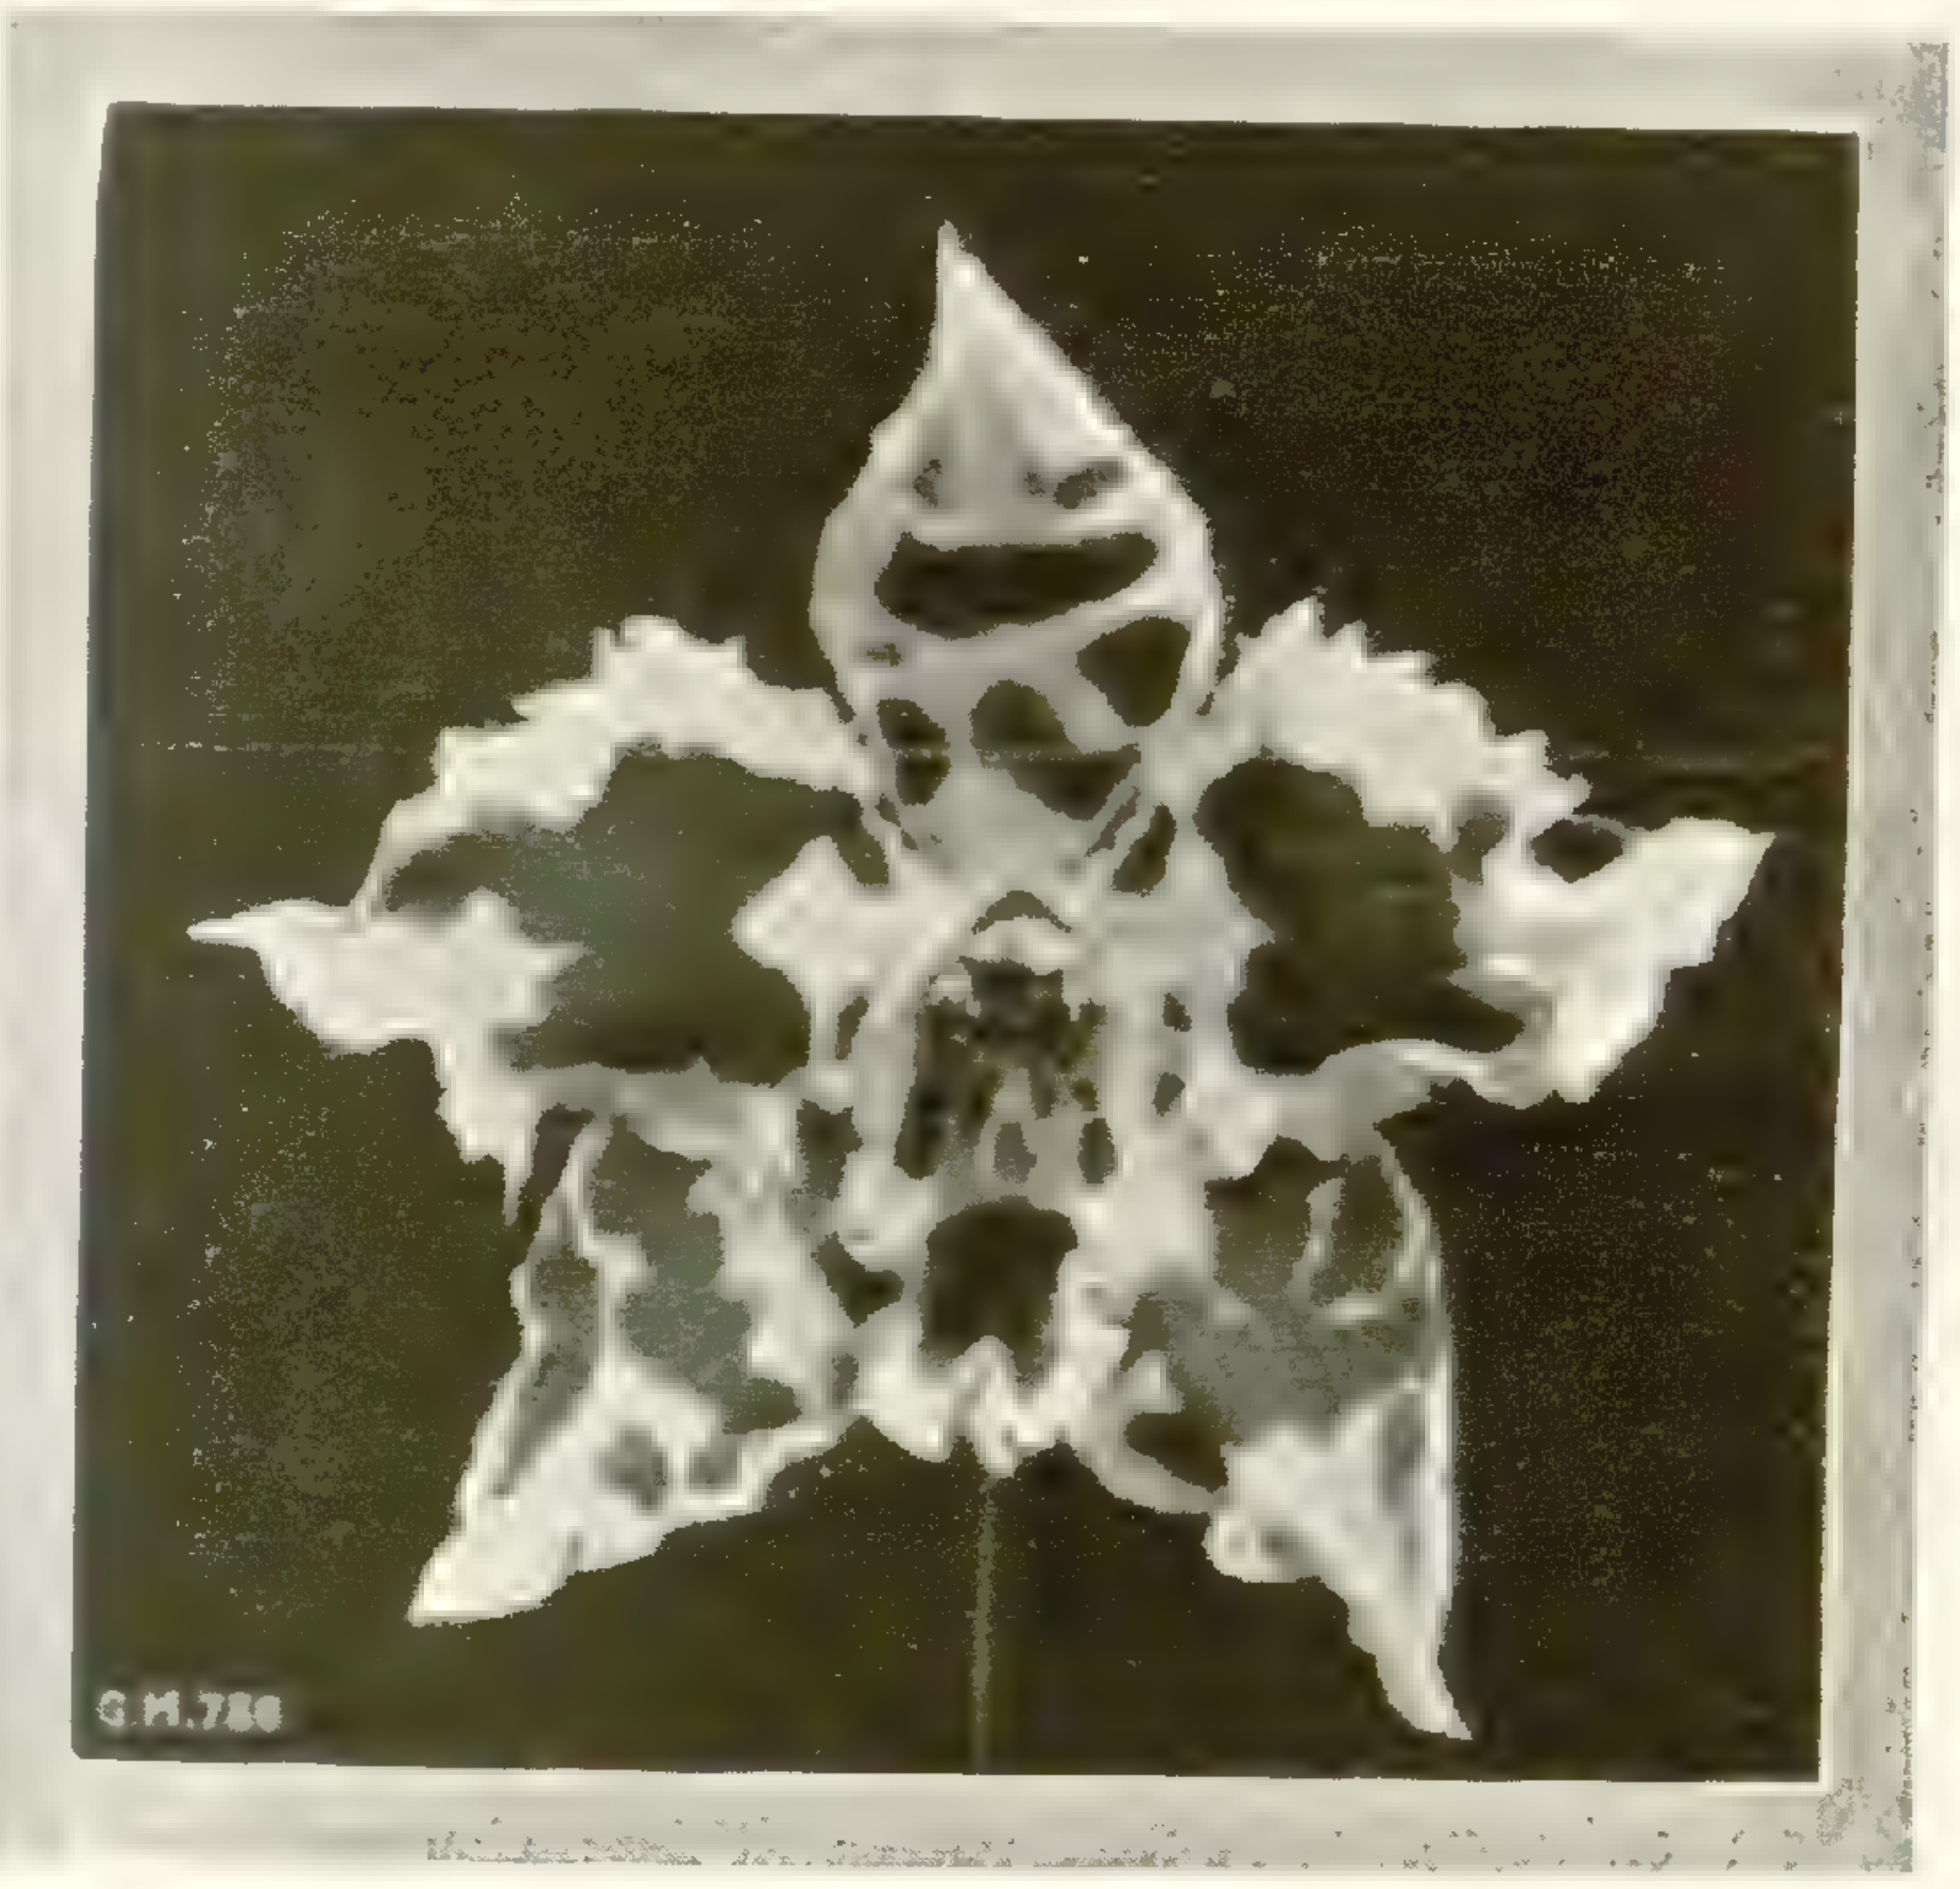
[illegible] Brothers, of Bedford, were, of [illegible] represented by strawberries, and the [illegible]-looking fruits shown in baskets made [illegible] to try the flavour. Amongst the [illegible] conspicuous was the well known Royal [illegible], but we also noticed Bedford [illegible], and a new, but somewhat dull-[illegible] variety called Reward. An element [illegible] was introduced in the presence of [illegible] of Cardinal nectarine, and Duke [illegible] and Hale's Early peaches.

[illegible] J. and F. Chatfield, Southwick, were represented by a small, but [illegible] exhibit of strawberries, in which there [illegible] some splendid fruits of Royal Sovereign. Cucumbers, long, green, and fresh, [illegible] from Mr. S. Mortimer, of Farnham, Surrey. Amongst the varieties staged [illegible] Mortimer's Bounteous, Tender [illegible], and Improved Telegraph. Ar-[illegible] in front of the cucumbers were several [illegible] of Tomato Sunrise. The Thatcham [illegible] and Flower Company, at Newbury, set [illegible] collection of forced vegetables, which [illegible] carrots, turnips, lettuces, radishes, [illegible] and mushrooms, with a host [illegible] for garnishing. There was too [illegible] the latter, and we cannot speak [illegible] the method of arrangement

[illegible] J. Harwood, of Colchester, staged a dozen bundles of giant asparagus, [illegible] we never wish to see finer samples. [illegible] Messrs. Sutton stage vegetables [illegible] always something worth seeing, and this occasion was no exception to [illegible]. The potatoes made a good exhibit in themselves, and young tubers of numerous varieties were shown in Sutton's own [illegible] style. Clean and fresh were the exhibits of White City, Harbinger, Ideal, King Edward VII., Reliance, Sutton's Seedling, and others, and the forcing capacities of the above and others were clearly demonstrated.

The miscellaneous collection of vegetables staged by the Reading firm was unique, and high quality was the keynote throughout. We noticed neat little heads of Sutton's April cabbage, crisp-looking Golden Ball lettuces, fine tomatoes of the variety Winter Beauty, peas, green, and carrying a dense bloom, and represented by varieties Duke of Albany, Early Giant, and Duchess of York. There were short, thick stems of the Sutton rhubarb, white broccoli, and still whiter cauliflowers, Sutton's Market cucumber, and marrows that could not be other than tender. Altogether, the exhibit was worthy of the firm, which means a great deal.

Messrs. George Bunyard and Co., of Maidstone, again proved that they are not only masters of the art of growing fine fruit, but also storing it. The splendid specimens staged were such as would have been good in November, but simply splendid in May. We noticed Striped Beefing, Newton Wonder, Annie Elizabeth, Alfriston, Betty Geeson, Smart's Prince Arthur, and Alden's Everlasting in the best of condition, and included in the exhibit was a remarkably fine dish of Uvedale's St. German pear.



TEMPLE SHOW.—ODONTOGLOSSUM CRISPUM MINORU (MESSRS. W. BULL AND SON).

A distinct variety remarkable for its handsome markings.

FERNS.

Ferns were grandly shown by Messrs. J. Hill and Sons, Barrowfield Nurseries, Edmonton: this firm had splendid specimens of Davallia fijiensis elegans, Nephrolepis todeaoides, N. Amerpohli, Gleichenia rupestris glaucescens, Platycerium Villincki, P. grande, Cyathea Scheideri, and Lomaria discolor. Mr. H. N. Ellison, West Bromwich, contributed a collection of ferns, displaying gold and silver gymnogrammas, davallias, and maidenhair ferns in great variety. The newer nephrolepises were well represented in this exhibit.

Messrs. H. B. May and Sons, Edmonton, submitted a bank of splendid exotic ferns, the huge specimens of davallias and nephrolepises attracting a great deal of attention. These ferns were exactly opposite the begonias, and formed an admirable foil for the brilliant colours. Platyceriums were excellent, and so were the lygodiums, the newer nephrolepises and Polypodium Schneiderianum.

CARNATIONS

Very beautiful were the splendid flowers of popular perpetual carnations submitted by Mr. A. F. Dutton, Iver, Bucks, who had lovely vases of Enchantress, White Enchantress, Winsor, Beacon, Mrs. T. W. Lawson, Fair Maid, Britannia, and the crimson Harlowarden. These were all in tall glass vases over maidenhair ferns. Messrs. Bell and Sheldon, Guernsey, showed magnificent carnation blooms, and set up very fine sets of The President, Marmion, Mikado, Helen Gould, Mrs. H. Burnett, Lady Bountiful, White Enchantress, and Mrs. T. W. Lawson.

A great variety of carnations came from Mr. C. F. Waters, Balcombe, Sussex, whose brightest samples were of Victory, Progress, Aurora, Britannia, Harry Fenn, Ceres, and Helen Goddard. Messrs. R. H. Bath, Wisbech, contributed excellent flowers of Beacon, Fairy Maid, Winsor, Winona, White Enchantress, and other popular perpetual carnations. Mr. Hayward Mathias, Medstead, Hants, had a bright and attractive group of carnation flowers, in which Cecilia, Mrs. H. Burnett, Rose Pink Enchantress, White Enchantress, Melody, Britannia, and Lord Welby were excellent. Mr. C. Engelmann, Saffron Walden, was another exhibitor of excellent carnations, and he had superb flowers of his new crimson Carola (A.M.) set amid beautiful blooms of popular kinds.

Messrs. Hugh Low, of Bush Hill Park, made a grand display with carnations. Overhead, suspended in bowls, hung huge Malmaisons and a beautiful crimson variety Britannia; Pink Enchantress was very fine, as also was White Enchantress, and we were much struck with the beautiful flowers of Black Chief, Winsor, and Red Lawson. The scarlet flowers of King Arthur were of great size, and the exhibit from end to end gave unmistakable evidence of splendid cultivation. It would be difficult to conceive a finer display of carnations.

Mixed in with roses, and giving a pleasing phase of variety, were the carnations shown by Messrs. W. Cutbush and Sons, Highgate. The varieties, White Perfection, Enchantress, Lady Coventry, Marmion, and Defiance, were much admired, and each and all were represented by finely grown specimens. The American Carnation Company, Sawbridgeworth, had a big and effective display of cut carnation blooms. Most of the popular varieties were represented, and set up with taste. Mr. W. H. Page, Tangley Nurseries, Hampton, showed a few big vases filled with splendidly grown carnation flowers, amongst which the varieties Mrs. T. W. Lawson, Beacon, Winsor, Britannia, and White Enchantress were especially noteworthy.

BEGONIAS

Gloriously beautiful were the tuberous begonias shown by Messrs. T. S. Ware, Lim., Feltham. This firm has a great reputation for these flowers, and admirably sustained it on this occasion. The plants were well grown, and the flowers splendidly developed, while they represented a wonderful variety of colours. Maud Nickells, Maggie Mercer, Marchioness of Bute, Mrs. Stoneham (a fine yellow), W. Marshall, Mrs. J. Brinsmead, Mrs. A. Paget, George Pike, and Mrs. Ernest James were a few choice varieties that greatly attracted us.

Superbly gorgeous were the double begonias shown by Messrs. Blackmore and Langdon, Twerton-on-Avon, Bath. The flowers were of immense size and substance, particularly those of Mrs. G. F. Fry, Marie Nicholas, the lovely pink Millicent, Pink Pearl, Mrs. D. Paterson, Mrs. W. L. Ainslie, Mrs. P. Clowes, and the exquisitely fringed and frilled varieties. Very beautiful, too, were the baskets of Begonia carminea and B. Mrs. Wilkie, vivid orange.

Messrs. J. Laing and Sons, Forest Hill, made up a small exhibit of double begonias in various forms and colours. The charming and graceful Begonia Lloydi was admirably shown by Mr. Mills, gardener to F. Lloyd, Esq., Coombe House, Croydon. This has double pendant flowers, and forms a lovely basket plant as well as a good conservatory subject in pots. There are now many colours represented, from white to deep red, and almost to yellow.

SWEET PEAS.

The sweet peas from Messrs. E. W. King and Co., Coggeshall, Essex, were very bright, especially the bunches of Helen Lewis, Mrs. W. King, the lavender Mrs. E. Noakes, Cream Spencer, Constance Oliver, the rich Sterling Stent, and the blue Lord Charles Beresford. Mr. C. W. Breadmore contributed a very large exhibit of well-grown sweet peas, and his best examples were of Helen Lewis, Constance Oliver, Dazzler, George Herbert, Marjory Linzee, Queen Alexandra, Audrey Crier, and Mrs. C. W. Breadmore.

The sweet peas from Mr. Robert Sydenham were a fragrant lot, and, in addition to popular varieties, the group contained Helen Grosvenor, Flora Norton, Paradise Ivory, Syeira Lee, White Gem, and several seedlings.

Prettily arranged and excellent in quality were the sweet peas set up by Messrs. G. and A. Clark, of Dover. The Duchess, Rosie Adams, Apple Blossom, Helen Lewis, Chillon, and Norma were a few of the varieties staged. Some beautiful vases of sweet peas were staged by Mr. W. R. Chaplin, of Waltham Cross, and in the receptacles were arranged such varieties as Henry Eckford, Helen Lewis, Helen Pierce, Dorothy Eckford, Evelyn Byatt, and Primrose Spencer, all in the pink of condition.

Not a large, but an extremely beautiful display of sweet peas was that set up by Messrs. Dobbie and Co., Rothesay. Mid Blue, Masterpiece, Princess Victoria, New Crimson, and Mrs. Henry Bell were amongst the principal varieties. Mr. H. J. Jones, of Ryecroft, Lewisham, made a speciality of sweet peas this year, and a beautiful lot of flowers were staged by him. The flowers were shown on long stalks in glasses, in three tiers, and a host of varieties were represented. One that appeared to attract attention was a novelty called Sterling Stent.

Messrs. G. Stark and Son, Great Ryburgh, are to be commended on their collection of sweet peas. The flowers were perhaps a trifle small, but the colours were nicely blended, and the arrangement of the whole exhibit was pleasing. Miss Hemus, of Upton-on-Severn, the well-known sweet pea specialist, had a compact little exhibit, in which a number of her novelties were displayed.

STOVE PLANTS.

Tall dracænas, elegant aralias, tree ferns, and bold anthuriums, with caladiums, asparagus, amaryilis in variety, various stove foliage plants, and the new pink Queen Alexandra marguerite were staged in the large tent by Messrs. William Bull and Sons, Chelsea. Bold and brilliant caladiums, bright crotons, gorgeously-flowered anthuriums,and graceful dracænas were set up by Mr. L. R. Russell, Richmond.

Messrs. John Peed and Son, West Norwood, were extensive exhibitors of caladiums, and they displayed good specimens of Charlemagne, Mrs. Box, John Peed, Henry Lovatt, the pale Silver Queen, W. E. Gladstone, Madame J. R. Box, and many others, the leaves perfect in form, and of delightful colouring.

The magnificent exhibit of stove plants arranged by Messrs. James Veitch and Sons, Chelsea, was one of the great attractions of the big tent. Every plant was a perfect specimen. Towards the back were giant specimens of Mrs. J. Box, The Mikado, Rose Laing, Louis A. Van Houtte, and Baron A. de Rothschild caladiums. In the centre was a group of Cattleyas Mendeli and Mossiæ, with Brasso-cattleya Veitchi carrying five immense flowers, and fine spikes of Disa Luna. The crotons on either side were superb, notably Dayspring, Thomsoni, and caudatus tortilis, while anthuriums of the Scherzerianum group, Rex begonias, bertolonias, and tillandsias, with handsome alocasias, assisted to make up a fine exhibit.

Messrs. Sander and Sons, St. Albans, contributed a fine exhibit of stove plants, and in it the newer things that gained prominence were Bowenia spectabilis serrulata, Caladium Superb, Clerodendron Campbelli, Bougainvillea Sanderiana variegata, Fourcroya Watsoniana, Pinanga Micholitzi, Gloriosa lutea and Bromelia tricolor. The exquisitely marked bertolonias from Mr. L. R. Russell, Richmond, were greatly admired by lovers of foliage plants, their blue and silvery veins and spots, and their wonderful shades of green proving a great attraction.

OUTSIDE DISPLAYS.

One of the prettiest as well as the most novel exhibits in the show was the tasteful Japanese garden arranged outdoors by Messrs. J. Carter and Co., Holborn. There were miniature rock gardens, dwarfed trees here and there, stone lanterns and bronze storks, a little mountain clad with conifers and maples, and with its little waterfall and colonies of ferns. There was a little bridge over the little lake, and the latter had its complement of gold fish and water lilies. The exhibit was a delightful one, and created a vast amount of interest.

Messrs. J. Cheal and Sons, Crawley, had a gay exhibit of Japanese maples, clematis, Pink Pearl rhododendron, delightful Ghent and mollis azaleas, cytisuses, spiræas, lilacs, viburnums, the yellow Quercus concordia, and the variegated form of Dimorphanthus mandschuricus. Messrs. H. Lane and Son, Great Berkhamsted, had a brilliant exhibit of Anthony Koster and other azaleas, Pink Pearl and other rhododendrons, and pillar and dwarf roses, cytisuses, etc., out of doors. Messrs. Carter Page and Co., London Wall, showed pansies and violas in pans in front of a standard of Pelargonium Clorinda. Mr. Clarence Elliott, Six Hills Nursery, Stevenage, contributed a small rock garden, and Mr. Maurice Prichard submitted an alpine garden of considerable size, well-furnished with phloxes, incarvilleas, primulas, saxifrages, androsaces, hardy orchids, rhododendrons, etc.

Very boldly constructed was the bog and water garden designed and planted by Messrs. Jas. Backhouse and Son, York. Large masses of rock were used, and between these were colonies of gentians, saxifragas, campanulas, primulas, Daphne cneorum, hardy cypripediums, ramondias, alyssums, etc.; while on the higher parts roses and azaleas and rhododendrons were effectively disposed, and attracted an immense amount of attention.

Messrs. W. Cutbush and Son, Highgate, contributed a bold rock garden display, surmounted by rhododendrons. The front was almost entirely a lake, with water-loving plants growing in the water, and bog plants along the margins. There was a waterfall down amid ferns, and there were colonies of azaleas on the higher ground. Primula japonica, gentians, aquilegias, trollius, pæonies, and a fine lot of eremurus and liliums were other features of beauty.

Quite an interesting little bed of pleasing colour was made by Mr. Amos Perry with Lithospermum prostratum Heavenly Blue. This is a pretty little plant, and well worth growing. Messrs. Gunn and Sons, Olton, had a display of their Viola cornuta purpurea outdoors as well as inside the tent. The Misses Hopkins had a specimen of their rockwork outside, but we thought the stone had been too liberally used.

Messrs. J. Veitch and Sons, as usual, had a grand display of flowering plants in the open. Eremurus robustus, rhododendrons, primulas, cannas, azaleas, and other things were included, the whole making up a very fine display. The roses and carnations displayed outside by Messrs. Hugh Low and Co., were a grand lot; the blooms of the carnations were fine, and the standard roses of the rambling type were much admired. Mr. L. R. Russell, Richmond, set up a collection of plants. Messrs. W. Fromow and Sons, Chiswick, were, of course, represented by acers, and we question if the firm has ever set up a finer collection of these interesting foliage plants.

Acers, azaleas, hydrangeas, and lilacs were the chief items in the outdoor group arranged by Mr. R. C. Notcutt, Woodbridge. Peacocks and all sorts of fantastic things in box were shown by Messrs. J. Piper and Son, Bayswater. A beautiful bank of hardy rhododendrons was shown by Messrs. John Waterer and Son, Bagshot, interspersed with acers and other foliage plants. Messrs. Thomas Cripps and Son, Lim., Tunbridge Wells, were represented by a large and excellent display of acers, and in the centre of the exhibit was a fine bank of Pink Pearl rhododendron.

The corner rockery arranged by Messrs. Pulham and Son, London, looked as if it was a permanent institution, so natural and complete did it look. Messrs. W. Cutbush and Son were represented by topiary work. A rockery, with a natural-looking pool in the middle, was arranged by Messrs. R. Wallace and Co., Colchester, and the whole of the furnishing was quite unique.

Messrs. Barr and Sons' pigmy trees, dwarf and ancient, after the manner of these Japanese freaks, were there, and, as usual, they aroused a considerable amount of interest. Messrs. H. B. May and Sons, Upper Edmonton, had a very interesting collection of plants outside. The background was formed of ferns, and in the centre were standard pelargoniums and heliotropes, with baskets of verbenas and other things underneath. In this exhibit was a number of strikingly coloured coleuses. Mr. V. Slade, Taunton, exhibited a collection of zonal pelargoniums, but the trusses were by no means so fresh looking as they must have been when they left the nursery.

HARDY FLOWERS.

A very bold, beautiful, and striking exhibit of hardy flowers was arranged most attractively by Messrs. R. Wallace and Co., Colchester. The central feature was the eremuri, and Lilium japonicum Colchesteri, L. Marbon, and L. Browni was particularly fine, but the groups of Colvillei varieties of gladiolus, the ixias, the big poppies, Lilium elegans, L. excelsum, and L. longiflorum, were all very good, and the hardy orchids and the large rosy heads of Allium Rosenbachianum were other attractions. Tulips were also shown in variety, including the new variety named The President.

Tulips and irises shown by Messrs. R. H. Bath, Lim., Wisbech, made a grand blaze of colour in No. 4 tent. Of the former they had very fine examples of Flambeau, Margaret, Mdme. Krelage, White Queen, Ada, New Moon, Inglescombe Pink, Europe, Marcella, Mr. Farncombe Sanders, La Tulipe Noir, and Gala Beauty. Messrs. T. S. Ware, Lim., Feltham, provided a miniature rock garden display with phloxes, Viola pedata bicolor, dodecatheons, aquilegias, Trillium stylosum, saxifragas, and hardy orchids.

A display of violas was set up by Messrs. Bakers, of Wolverhampton. The flowers, which were very fresh, were nicely set up, and all the principal varieties were represented. The same firm also had a varied display of hardy flowers, which contained a host of interesting things. Mr. H. H. Crane, of Highgate, had also a very nice lot of violas, which were tastily set up in shallow bowls filled with wet sand. The foliage used, however, did not seem to be quite appropriate to violas.

Messrs. Lilley, Guernsey, were represented by a pleasing collection of flowers, which included gladioli, irises, ixias, and sparaxis in interesting variety. Messrs. George Jackman and Son, Woking, set up a big and interesting exhibit of hardy flowers. Amongst other things we observed Trollius Orange Globe, Lupinus polyphyllus roseus, Cypripedium spectabile, pyrethrums, and irises. Messrs. [illegible], of Exmouth, showed a collection of Oriental poppies, which came in for conconsiderable attention.

Some of the most magnificent blooms of tulips we have ever seen were set up by Messrs. Alex. Dickson and Sons, Newtownards, Co. Down, Ireland. The severe heat of the tents made many of the large blooms hang their heads somewhat, but there was no mistaking the quality, substance, and colour of these superb flowers. A few of the finest varieties were Eric, Inglescombe Pink, Clara Butt, Europe, Sultan, Duke of Westminster, White Queen, Eureka, Mr. Farncombe Sanders, Galatea, J. Ruskin, and Bouton d'Or, the latter grandly represented. Messrs. Hogg and Robertson set up a most interesting collection of Irish tulips. The flowers were very fine, and included all the best varieties in this section of bulbous plants. A very pretty exhibit was that sent from Messrs. Gilbert and Son, of Bourne, Lincs. It was composed entirely of anemones, the most striking of which was King of the Scarlets. Aquilegias, delphiniums, a fine lot of Heuchera sanguinea Shirley, and a cluster of Lupinus polyphyllus Rose Queen, were the chief features in the bank of hardy flowers arranged by Messrs. B. Ladhams, The Shirley Nurseries, Southampton, but there were numerous other flowers in the collection worthy of notice. Mr. N. Lewis, Bridgwater, set up a neat little collection of hardy flowers, the principal feature of which was the St. Brigid anemones. A dwarf polyantha rose, called Jessie, shown by H. Merryweather and Sons, Lim., is a pretty little variety with flowers of scarlet hue.

Big scented clusters of lilacs were exhibited by Messrs. Paul and Son. A number of varieties were represented, both single and double, giving visitors an illustration of the beautiful things there are in the lilac family. Tasteful to a degree was the collection of new hybrid centaureas set up by Messrs. Jarman and Co., of Chard. The Bride, Bridegroom, and Honeymoon were the chief varieties, and in the collection we noticed several charming new sweet peas. One does not expect to see dahlias shown in May, but Messrs. Carter Page and Co. had an interesting collection of [illegible] varieties. Messrs. G. and A. Clark, Dover, showed a grand lot of hardy flowers, which included the stately Eremurus himalaicus, Pyrethrum John Malcolm, Phlox canadensis Laphami, and Marguerite White Perfection, the latter a novelty with pyrethrum-like white flowers.

A large display of hardy flowers was made by Mr. M. Prichard, of Christchurch; many beautiful things were represented, including poppies, irises, pyrethrums, and pæonies. From Mr. John Forbes, of Hawick, came a [illegible] collection of phloxes, pentstemons, [illegible], violas, and Black Vesuvius pelargoniums. Messrs. W. Bull and Sons, Chelsea, were represented by a showy collection of [illegible] in great variety. Messrs. Amos Perry, Enfield, set up a most interesting lot of [illegible], amongst which were pretty phloxes, [illegible] in variety, tree pæonies in a number of shades of colour, as well as alyssums, thalictrums, and poppies. Taken altogether, there was no exhibit in the hardy flowering section of more interesting character. Quite unique was the collection of polyanthuses and auriculas staged by Messrs. Storrie and Storrie, Glencarse, Perth, N.B., and this exhibit attracted considerable attention. Sweet and [illegible] were the miniature mountains of lily of the valley set up by some exhibitor whose name did not appear. Densely blue was the [illegible] of Viola cornuta purpurea shown by Messrs. Gunn and Son, Olton, Warwickshire, and we noticed that the flowers were very much admired.

Messrs. G. Bunyard and Co., Maidstone, were represented by a grand lot of hardy flowers, amongst which poppies, tulips, delphiniums, pyrethrums, irises, and pæonies were represented. Mr. A. J. Harwood, Colchester, set up a very interesting collection of varieties of Primula Sieboldi that was much admired. Messrs. W. Artindale and Son, Sheffield, set up a very nice lot of violas, which were arranged in a pleasing manner.

Messrs. Harkness and Sons, Bedale, showed some very fine trolliuses, notably King Cup, Orange Globe, Buttercup, and Triumph, all splendid flowers in yellow shades. Messrs. R. P. Ker and Sons, Liverpool, staged the pink variety of Queen Alexandra marguerite in fine condition. Messrs. Bees, Lim., Liverpool, again showed their new primulas Bulleyana and Lichiangensis.

Rather too crowded in arrangement, but made up of a host of interesting flowers, was the exhibit sent by Mr. R. C. Notcutt, of Woodbridge. Most of the principal flowers in the hardy flower section were represented. Messrs. George Mallet and Co., Cheddar, had a fine exhibit of hardy flowers, containing the things mostly seen in such collections. Messrs. G. Reuthe, of Keston, had a grand lot of hardy flowers in bewildering variety. Exceptionally fine were the tulips, rhododendrons, magnolias, azaleas, and daphnes, but other things were equally worthy of mention. The display of hardy flowers from Turnbull's Direct Supply Company contained some interesting flowers. From Messrs. Reamsbottom and Co., Alderborough, came an interesting exhibit of anemones and mimulus. The colours were extremely pleasing, and some beautiful varieties of these interesting flowers were displayed.

Perfect in form and beautiful in colouring were the pansies and violas staged by Messrs. Dobbie and Co., of Rothesay. The arrangement of the flowers left little room for criticism, and there was a freshness about them that was very striking. Yards of tabling were occupied by a splendid show of tulips from Messrs. Barr and Sons, Covent Garden, and it is hardly necessary to add that everything good in the tulip world was included. The same firm also staged an interesting collection of hardy flowers, which included irises in great variety, geums, pyrethrums, and phloxes. Along the front of the exhibit was a tasteful arrangement of alpine plants. Messrs. Hobbies, Lim., Dereham, sent an interesting but rather crowded collection of irises. Lilac flowers, and a beautiful lot of them in variety, were staged by Mr. Charles Turner, of Slough, and sweet was the aroma they gave off. All the best varieties were represented.

ROCKERIES AND ALPINE PLANTS.

The King's Acre Nursery Company filled a long stretch of tabling with alpine flowers interspersed with stones, arranged in undulating form. Considerable taste was displayed in the arrangement of the rockery set up by Messrs. Bakers, of Wolverhampton. Stone was used boldly and to advantage, and amongst the flowers were alyssums, Edrianthus serpyllifolius major, Dianthus cœsius, aquilegias, and saxifragas.

Small but tasteful was the rockery arranged by Messrs. Geo. Mallett and Co., Cheddar, and apparently growing amongst the stones were to be seen many gems of the alpine section. Forming the groundwork of an exhibit which was flanked by hardy flowers, Messrs. G. Reuthe, Keston, arranged a most interesting lot of alpines, which were arranged in a deceptively natural manner. Messrs. J. Cheal and Sons, of Crawley, are masters of the art of setting up miniature rockeries, and once again they had a most interesting exhibit. All sorts of beautiful little things were arranged in pockets and crevices, and the display as a whole had a most natural appearance. Another pretty rockery was that which came from the Craven Nursery, Clapham, and amongst the flowers shown were Primula farinosa, Saxifraga aizoon rosea, and Edrianthus serpyllifolius. The arrangement of this exhibit was extremely pleasing. Not the least interesting exhibit of rock plants in the show was that set up by Messrs. W. Artindale, of Sheffield. Primulas were very fine, as also were alyssums, and the style in which the plants were displayed was quite pleasing.

Natural in its arrangement, and filled with pretty and interesting flowers, was the rockery set up by the Guildford Hardy Plant Company. We wonder what weight of sandstone was used by Mr. H. Hemsley, of Crawley, in the make up of his rockery, but it must have been very considerable. The stone, however, was used to advantage in showing up the many charming flowers that were nestling in the crevices. The exhibit was a most interesting one.

MISCELLANEOUS.

A few exhibits that evaded us in our first tour of the great show are now included here, as they were discovered too late for inclusion under their right headings.

A charming exhibit of rambling roses, set up as pillars and arches by Mr. G. Prince, Longworth, Berks, was delightfully novel in design. Lady Gay, Yellow Banksian, Hiawatha, Dorothy Perkins, and Minnehaha, were well represented, and below these Mdme. Jean Dupuy, Richmond, The Lyon Rose, Souv. de Pierre Notting, and Earl of Warwick were very beautiful.

Very pretty were the new hybrid gerberas sent by M. R. Adnet, Cap d'Antibes, France. The blooms were of large size, and ranged from white through pink and rose shades to yellow, orange, and scarlet. Some had very long florets, while others had very shapely blooms and broader florets. The flowers were delightful even after their 1,000 miles journey.

Mr. S. Mortimer, Farnham, Surrey, showed good blooms of the popular varieties of carnations, and he set them up in a most attractive manner. Mr. Hunter, gardener to his Grace the Duke of Marlborough, Blenheim, set up a table of finely developed perpetual and Malmaison carnations; Robert Craig and Enchantress were particularly good.

CERTIFICATES AND AWARDS.

Orchid Committee.

First Class Certificate.—To Lælio-cattleya Eurylochus, from Messrs. Charlesworth and Co.; to Oncidium Charlesworthi, from Messrs. Charlesworth and Co.; to Odontoglossum mirum Emperor of India, from Mons. C. Vuylsteke; to Odontoglossum Aglaon, from Mons. C. Vuylsteke; and to Odontoglossum Princess Victoria Alexandra, from Mons. C. Vuylsteke, Loochristy.

Award of Merit.—To Cattleya Mossiæ, Gatton Park var., from Sir J. Colman, Bart., Reigate.

Botanical Certificate.—To Oncidium Retemeyerianum and Sigmatostalix Eliæ, from J. Birchenall, Esq., Alderley Edge, Cheshire; Bulbophyllum Lemniscatoides, and Gongora quinquenervis, from Sir J. Colman, Bart., Reigate.

Cultural Commendation.—To Dendrobium Victoria Regina, from R. Ashworth, Esq., Newchurch, Manchester.

Floral Committee.

Award of Merit.—To Rose Coquina, from Messrs. William Paul, Waltham Cross, and Messrs. Hobbies, Dereham; Rose Margaret, from Messrs. W. Paul, Waltham Cross; to Carnation Carola, from Mr. C. Englemann, Saffron Walden; to Begonia Pink Pearl, from Messrs. Blackmore and Langdon, Bath; to Rose (polyantha) Mrs. Taft, from Messrs. Low and Co., Enfield; to Iris Sir Dighton-Probyn, and to Iris Sir Trevor Lawrence, from Mr. Amos Perry, Enfield; to Ficus australis variegata, from Messrs. Sander and Sons, St. Albans; to Ptychoraphis Siebertiana, from Messrs. Sander and Sons; to Marguerite White Perfection, from Messrs. G. and A. Clark, Dover; to Rose American Pillar, from Messrs. H. Cannell and Sons, Swanley; and to Rose Jessie, from Messrs. Merryweather and Son, Southwell.

GOLD MEDALS.

To Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs W. Cutbush and Son, Highgate, for rock garden plants; to Messrs. James Veitch and Sons, Chelsea, for stove foliage plants, herbaceous plants, flowering plants, trees, etc.; to Messrs. R. Wallace and Co., Colchester, for tulips, lilies, pæonies, irises, hardy plants, and water garden; to Messrs. William Paul and Son, Waltham Cross, for roses, trees, and shrubs; to Messrs. Paul and Son, Cheshunt, for roses, lilacs, and new shrubs; to Messrs. H. B. May and Sons, Edmonton, for exotic and hardy ferns and flowering plants; to Mr. H. Burnett, St. Margaret's Guernsey, for carnations; to Messrs. J. Waterer and Sons, Lim., Bagshot, for rhododendrons, flowering and evergreen shrubs.

SILVER CUPS.

To Sir J. Colman, Bart., Gatton Park, Surrey, for orchids (gardener, Mr. J. Collier); to Leopold de Rothschild, Esq., Gunnersbury Park, W., for Vanda teres (gardener, Mr. G. Reynolds; to Mrs. Kershaw Wood, Glossop, Derbyshire, for orchids and gloxinias (gardener, Mr. J. Gould); to Messrs. Armstrong and Brown, Tunbridge Wells, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids and foliage plants; to Messrs. J. Veitch and Sons, Chelsea, for hardy flowering plants and shrubs; to Mr. L. R. Russell, Richmond, S.W., for flowering trees and shrubs; to Messrs. J. Carter and Co., Holborn, W.C., for flowering plants (begonias, carnations, gloxinias, etc.); to Messrs. Barr and Sons, Covent Garden, W.C., for hardy plants and pigmy trees and herbaceous; to Messrs. G. Jackman and Son, Woking, for clematis and hardy plants; to Mr. A. Perry, Enfield, for tree pæonies and herbaceous plants; to Mr. G. Reuthe, Keston, for alpines, rhododendrons, tulips, and rare shrubs; to Messrs. H. Cannell and Son, Swanley, for cannas, cacti, and phyllocactus; to Messrs. J. Cheal and Sons, Crawley, for trees and shrubs, alpines, and rock garden; to Messrs. Bell and Sheldon, Guernsey, for carnations; to Messrs. F. Cant and Co., Colchester, for roses; to the Craven Nursery Company, Clapham, Lancaster, for alpines; to Mr. G. Mount, Canterbury, for roses; to the American Carnation Nursery, Sawbridgeworth, for carnations; to Messrs. T. Cripps and Son, Tunbridge Wells, for Japanese acers, etc.; to Messrs. Alex. Dickson and Sons, Newtownards, for tulips and roses; to Messrs. Hobbies, Lim., Dereham, for roses; to Messrs. J. Backhouse and Son, Lim., York, for miniature rock garden; to Messrs. R. and G. Cuthbert, Southgate, N., for azaleas; to Messrs. R. P. Ker and Son, Liverpool, for amaryllis; to Messrs. W. Cutbush and Son, for clipped trees and carnations, roses, etc.; to Messrs. Sutton and Sons, Reading, for greenhouse plants; and to Messrs. T. Rivers and Son, Sawbridgeworth, for fruit trees in pots.

Sherwood Cup (value £21), for group of orchids, to F. Mentieth Ogilvie, Esq., for orchids; silver cup to Sir Jeremiah Colman, Bart., Reigate, for orchids. For a group of orchids not exceeding 75 sq. ft.—(Veitch Memorial Medal and £5), to the Duke of Marlborough; and small silver cup, to Mrs. Kershaw Wood, of Glossop. The silver cup for a quite small group of orchids was not awarded, but the second prize, a silver Flora medal, was granted to R. Ashworth, Esq., Manchester.

SILVER-GILT AND SILVER MEDALS.

Silver-gilt Knightian. — To Messrs. G. Bunyard and Co., Lim., Maidstone for fruit trees in pots; and to Mr. S. Mortimer, Farnham, Surrey, for carnations, cucumbers; and tomatoes.

Silver-gilt Flora.—To F. A. Lloyd, Esq., Coombe House, Croydon (gardener, Mr. M. Mills), for a group of begonias; to Mons. R. Adnet, Cap d'Antibes, France, for hybrid gerberas; to Messrs. J. W. Moore, Lim., Rawdon, Leeds, for orchids; to Mr. M. Prichard, Christchurch, Hants, for alpines and rock plants; to Messrs. Bakers, Wolverhampton, for violas, sweet peas, rock garden, and herbaceous plants; to Messrs. T. S. Ware, Lim., Feltham, for begonias, carnations, etc.; to Messrs. Blackmore and Langdon, Bath, for tuberous begonias; to Messrs. R. H. Bath, Wisbech, for tulips and carnations; to Messrs. H. Low and Co., Enfeld, N., for orchids, carnations, and roses; to Mr. C. Turner, Slough, for roses and azaleas; to Messrs. B. R. Cant and Sons, Colchester, for roses; to Mr. A. F. Dutton, Iver, Bucks, for carnations; to Messrs. J. Peed and Son, West Norwood, for caladiums; to Mr. C. F. Walters, Balcombe, for carnations; to Messrs. J. Hill and Son, Lower Edmonton, for ferns; and to Messrs. W. Fromow and Son, Chiswick, for Japanese maples.

Silver-gilt Banksian Medal.—To Mr. W. H. Page, Hampton, for carnations, liliums, roses, etc.; to Mr. R. C. Notcutt, Woodbridge, for hardy flowers; to Messrs. W. Bull and Son, Chelsea, for orchids, foliage plants, and cut flowers; and to Messrs. R. Smith and Co., Worcester, for clematises.

Silver Knightian Medal.—To Messrs. Hughes, Jones, and Peers, Thatcham Fruit Farm, Newbury, for vegetables and salads; to Mr. R. Stephenson, Burwell, Cambridge, for asparagus; to Messrs. J. and F. Chatfield, Southwick, Sussex, for strawberries; and to Messrs. Laxton Brothers, Bedford, for strawberries.

Silver Flora Medal.—To the Hon. Vicary Gibbs (gardener, Mr. E. Beckett, V.M.H.), Elstree, Herts, for streptocarpus; to Wickham Noakes, Esq. (gardener, Mr. W. Howarth), Selsdon Park, Croydon, for calceolarias; to Mr. H. Mathias, Stubbington, Hants, for carnations; to Mr. A. R. Upton, Millmead, Guildford, for alpines; to Mr. J. Piper, Bayswater, W., for trained box trees; to Misses Hopkins, Shepperton, for alpines and rock plants; to Mr. C. Engelmann, Saffron Walden, for carnations; to Messrs. Cypher and Sons, Cheltenham, for orchids; to Messrs. G. and A. Clark, Lim., Dover, for hardy flowers, plants, etc.; to Mr. C. W. Breadmore, Winchester, for carnations, etc.; to Messrs. Dobbie and Co., Rothesay, for herbaceous plants; to Messrs. Hogg and Robertson, Dublin, for tulips; to Mr. H. Hemsley, Crawley, for alpines and rock plants; to Messrs. H. J. Jones, Lim., Lewisham, for sweet peas, etc.; to Mr. W. R. Chaplin, Waltham Cross, for sweet peas; to Mr. J. Green, March, for carnations; to Messrs. E. W. King and Co., Coggeshall, for sweet peas; to Messrs. Ladhams, Lim., Shirley, for hardy flowers and plants; to Mr. W. H. Lancashire, Guernsey, for carnations; and to Mr. George Prince, Longworth, for roses.

Silver Banksian Medal.—To Messrs. Stanley and Co., for orchids; to Messrs. W. Artindale and Son, Sheffield, for alpines, etc.; to Messrs. G. Mallett and Co., Cheddar, for rock and herbaceous plants; to Mr. W. H. Page, Hampton, for carnations, roses, etc.; to the King's Acre Nurseries, Lim., Hereford, for alpines and herbaceous; to Mr. C. Elliott, Stevenage, for miniature rock gardens; to Mr. H. N. Ellison, W. Bromwich, for ferns; to Messrs. Gunn and Sons, Olton, for hardy herbaceous, etc.; to Mr. Frank Lilley, St. Peter's, Guernsey, for gladioli and bulbous plants; to Messrs. Storrie and Storrie, Perth, for polyanthus and auriculas; and to Vivian Phillips, Esq. (gardener, Mr. T. Hobbs), Orpington, for calceolarias.

FORTHCOMING ENGAGEMENTS.

THURSDAY, June 3.—Linnean Society meets.

SATURDAY, June 5.—French Horticultural Society of London.

MONDAY, June 7.—National Fruit Growers' Federation, council meeting.

TUESDAY, June 8.—Royal Horticultural Society: committees meet at 12 o'clock; lecture at 3 p.m. on "Some Old Superstitions about Plants," by the Rev. Professor G. Henslow, V.M.H.; Scientific Committee at 4 o'clock.

EXHIBITIONS AND MEETINGS.

◆

East Anglian Horticultural Club.

This club again had a most excellent show, at its May meeting, of flowers, fruits, and vegetables. Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, staged some exceptionally good strawberries, large and well-coloured; and apples, for so late a date, were fine examples. The educational side of the club was added to by the receipt of four splendid essays in a competition upon "The Cultivation of Herbaceous Flowers." The practical side of gardening was much evidenced by all the writers; some dealt with the names of flowers too freely, and lost points against those who gave the preparation of the border and planting in better detail. The judges, Messrs. L. Smith. T. G. Bishop, and H. Goude, gave their awards as follows: 1, J. Ewing, Stoke Hall Gardens; 2, Mr. D. Howlett, Thorpe; and 3, Mr. C. Matthews, Thorpe.

The members decided to hold a summer outing this year on July 15, and, if permission can be obtained, Earsham Hall, the seat of Captain Mead, J.P., was the place decided upon for the visit. There is a rock garden of very large dimensions there, and many other treats for horticulturists.

British Gardeners' Association.

LONDON BRANCH.

At the recent meeting of this branch an important lecture on "Nitrogen Fixation in Plants" was given by Professor W. B. Bottomley, M.A., of King's College, London. On rising, Professor Bottomley said he had been greatly interested in the questions and the answers given during the business part of the meeting, and he thought the British Gardeners' Association was capable of doing good work for gardeners.

He outlined the work of bacteria in the soil, illustrating it by some remarkable lantern slides. The extraordinary rapidity with which these soil organisms multiplied was clearly shown. Important experiments had, he said, been carried out, which at at no very distant date would have a far-reaching effect in the culture of plants. The escape of free nitrogen was very great. All were well aware that leguminous plants were able to absorb nitrogen from the air, but he proposed to deal principally with those plants incapable of doing so. Details of the trials conducted at the Royal Horticultural Society's Gardens at Wisley were given, and expressed the wish that all gardeners willing to give nitro-bacteria a fair trial would experiment.

There was a good discussion, in which Messrs. E. F. Hawes, J. Weathers, A. J. Hartless, V. Cockram, and H. Cowley took part. A very hearty vote of thanks was then passed to Professor Bottomley for his valuable lecture.

Birmingham Gardeners' Association.

The second summer outing took place on May 19, and a visit was made to Highbury, the residence of the Right Hon. J. Chamberlain. The party of about fifty members were met at Highbury by Mr. J. Deacon, the head gardener, who conducted them through the houses and grounds, pointing out new features and the development of old ones. The Dutch garden, the lake, and the rock garden and herbaceous collections were greatly admired by all, and proved most attractive. The orchids proved another great attraction, and the collection was examined under the guidance of Mr. Mackay, the orchid grower.

Mr. T. Humphreys proposed that a vote of thanks be sent to Mr. J. Chamberlain, and this was unanimously carried, as were votes of thanks to Mr. Deacon and Mr. Mackay for their very great courtesy during the afternoon.

TRADE NOTES.

Water distribution forms an important factor in garden management, and with a fuller recognition of this fact increased attention is being paid to the improvement of the appliances by which water used in gardens may be distributed. One of the most noteworthy of the appliances to which we have had our attention called is that known as the Max Water Distributor, which combines simplicity and efficiency in a very marked manner. This distributor is so small and compact that it stands only nine inches high, and so powerful that the water, in course of distribution, may be made to cover an area of 5,000 square feet. Unlike the [illegible] sprinklers commonly used, it distributes an even quantity of water to every part of the area covered, and may be readily adjusted to cover areas of any shape and size within the range of the machine. The action is perfectly automatic; the water from the hose, in passing through the machine, actuates a small turbine, from which the power is taken to regulate the delivery [illegible]. Two gear wheels are attached to the nozzle, the one rotating the device, while the other is a cam which, by means of a link motion and cam wheel, deflects the nozzle more or less from a vertical position, and this variation ensures an even distribution of the water over the whole surface. We have formed a high opinion of the [illegible] of the Max Water Distributor, and [illegible] that our readers should apply to the Max Patent and Manufacturing Company, Westcombe Hill, S.E., for prices and particulars.

The endless trouble of weeding gravel paths free may be wholly avoided by the judicious use of a well-tried weed killer, and those experienced in garden management are careful to take advantage of [illegible]. In this connection may be mentioned the Eureka Weed Killer, which has for many years been supplied to many of the [illegible] estates and gardens, and not a few of the smaller gardens in the United Kingdom. The Eureka Weed Killer is manufactured by Messrs. Tomlinson and Hayward, [illegible], who also make an excellent [illegible] for destroying green-fly, etc., under the name of Eurekatine. This firm has recently issued a useful booklet entitled "[illegible] in Garden and Greenhouse," which will be sent free on application to their Department A.

ANSWERS TO CORRESPONDENTS.

RHODODENDRONS.—F. A., Chard: We have dealt with the subject at various times and in various ways, but we will keep your request in mind, and endeavour to grant it at an early date.

APPLE FARMING.—E., York: There are several matters to be carefully considered before entering upon apple farming for a living, and one of the first is the amount of experience you have as a fruit grower, and your readiness to work hard. Other points are the accessibility of a market, soil, and situation, and the amount of capital you can command to stock the farm and keep things going until the fruit becomes remunerative. We believe a good living can be made out of the business, but unless you have experience, and ability as a grower and seller, we do not advise you to enter it.

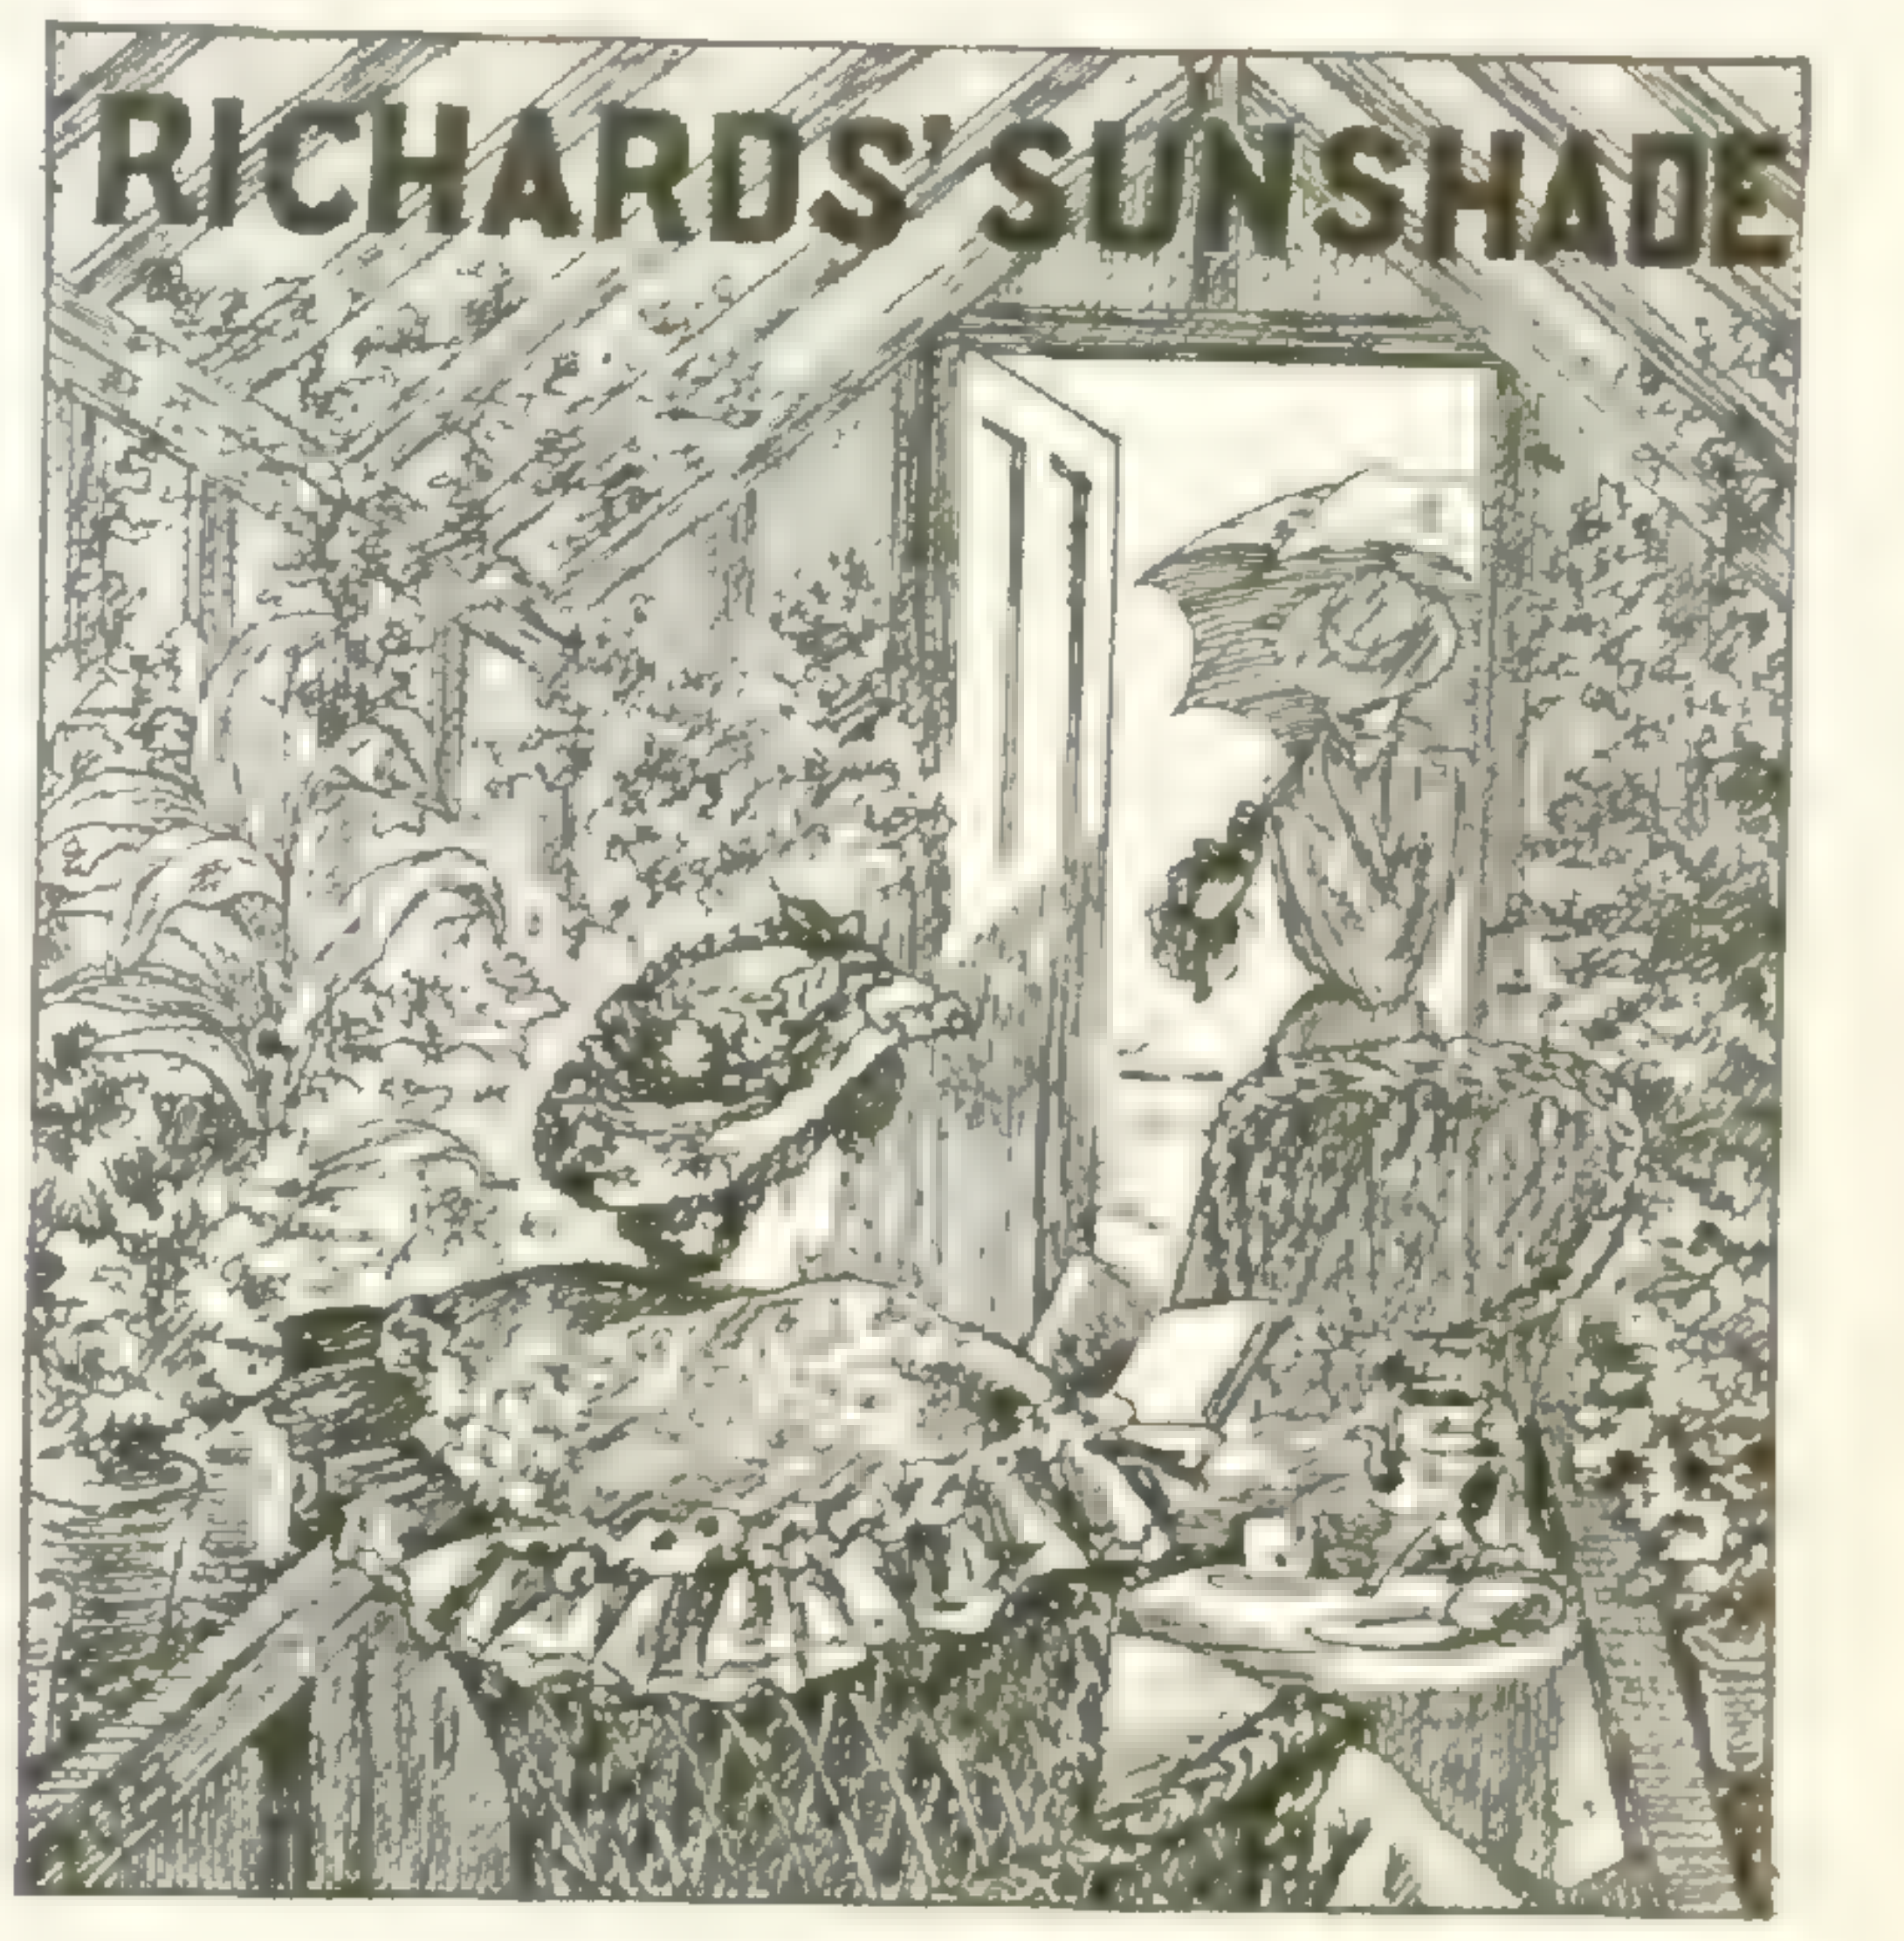
FAILURE WITH MELONS.—Puzzled, Swansea: The melons are suffering from a bad attack of eelworm, and nothing you can do will preserve them. Clean all soil and plants out of the house, and thoroughly clean every bit of wall, woodwork, and glass, and dress all brickwork with hot limewash, to which paraffin is added. Obtain new soil from another source, and some strong young plants, and start again.

DAMAGED ROSE SHOOTS.—J. S., Hayling Island: The damage to the rose shoots is not due directly to fungus attack, although a little common mould was present on the surface of some of the dead portions. The growths have been severely frozen, probably just as the sap was rising, and so the evil effects were not apparent until the demand of the green growths and leaves laid a strain upon the stems that they could not stand. The tissues have been so injured as to be incapable of fulfilling their functions, and, consequently, they have gradually died, and made the black and brown patches. You can only cut back the damaged portions to healthy wood, and encourage new growth.

CLUSTER-FLOWERED TOMATOES.—L. A. V., Stourport: Tomatoes, like many other highly-selected and highly-cultivated plants, are very subject to freakishness, and seem to delight in "going astray" when circumstances give them the opportunity. Certain varieties seem more liable to produce densely-clustered flower trusses than others, and great care ought to be taken not to save seed from fruits produced in such clusters, or, better still, on the plants that yield such clusters. In addition to some inherent tendency to freakishness, it must be admitted that tomatoes do many queer things if starved, suddenly checked, or grown too freely, and we think the tendency has been accentuated by a check received while the plants were more or less root-bound in the small pots, and allowed, perhaps, to become severely dry. Pinch out the dense clusters, or severely thin them with pointed scissors, and allow the strongest of the new growths to take the lead. A little weak liquid manure will help the new growth to get away, but this must not be given in such a way as to cause rank and unfruitful growth.

BORROWING BOOKS FROM THE LINDLEY LIBRARY.—M. E. W., Gravesend: The regulations are that anyone requiring the loan of a book to be taken from the library must make written application to the secretary, and books will be granted on the following conditions, viz.: (a) That the borrower be personally known to one or more of the officers of the society, or at least shall produce satisfactory references. (b) That the borrower sign a receipt for the volumes before removing them from the premises, in a book provided for that purpose (or by postcard if unable to do so in person); undertake to restore the books in good condition, and generally to comply with the regulations. (c) That not more than three volumes be lent to one person at the same time. A certain discretion will be used as to what books shall be lent out, but, as a rule, un-

Do Not Allow Plants Under Glass
to be overdone and dried up by excessive sunshine. A 1/- packet will shade 100 square feet of glass.



REGD. TRADE MARK.

For Greenhouses, Conservatories, Garden Frames, and all other Glass structures which require shading. **"Sunshade"** is of a pleasing light green colour. It can be easily applied with an ordinary paint brush or with a garden syringe. Guaranteed to adhere firmly to the glass for the season. Rain will not wash it off; at the same time is easily removed with brush and water when necessary.

In 8 oz. Packets, 1/- each. 12 in a Box.

Single Packets or more can be purchased from any Nurseryman, Seedsman and Florist.

bound periodicals, expensively illustrated works, and works of common reference, which are likely to be in frequent requisition within the library itself, must not be removed from the premises. All books borrowed must be returned to the library within one calendar month from the date of issue, but an extension of time may be granted on application.

SWEET PEA CULTIVATION.—K. G. A., Celbridge: We consider "Sweet Peas and their Cultivation" the best book dealing with the fragrant and popular annual. It is written by Mr. C. H. Curtis, the hon. secretary of the National Sweet Pea Society, who grows the flower extensively and well, and it is published at the office of the GARDENERS' MAGAZINE, 148, 149, Aldersgate Street, E.C., from whence it can be obtained for 1s. 2d. or 1s. 8d., post free, according to whether you obtain stiff paper or cloth binding. You had better hurry up with your order, as we understand the present edition is nearly exhausted.

MULCHING SWEET PEAS.—H. W., Luton: It is a mistake to mulch sweet peas while the soil is cold or very dry. Thoroughly clean the ground between the rows and plants, after staking is finished, and then, after a warm day or two, soak the ground with water, and apply a mulching of short manure. We prefer to apply the mulch a few hours after the soaking, the next day for instance, first dressing the ground lightly with some fertiliser, or soot, and hoeing this in. If the work is done well there will be no need for drawing the mulch aside for further waterings, as water will soak through into the ground, and carry with it the manurial properties of the mulch.

DISEASED HELLEBORES.—X. O., Tunbridge Wells: We do not recognise the disease, but we are making investigations, and will hope to give you an answer next week.

PERPETUAL CARNATIONS OUT OF DOORS.—L. D. W., Winchester: We believe there is a great future for perpetual-flowering carnations as summer-flowering plants out of doors, and have on several occasions drawn attention to the success of the few experiments made in this direction. We agree that, as a rule, some carpeting plant should be used when the carnations are of some size, and they should always be strong plants, with good growth and flower buds, when planted at the end of May, and arranged in a bed or grouped in a border. We have just planted a fair-sized bed with strong plants like those suggested, and, for carpeting, have used annual gaillardias. Blue or yellow violas would probably do as well, but we had not these to spare, and so used the gaillardias. Do not use red or pink flowers under the carnations, as it is hardly likely these would look well under varieties of pink, salmon, or red shades. Kœniga maritima does not suggest a suitable groundwork, as this little plant produces a dense mass of white, which would not serve to show up the lighter carnations, though it might do for deep crimson varieties, and for deep yellows, when we get them. Let us know what you use, and with what success.

TROPICAL FERNS AND REX BEGONIAS.—C. C. A., Warwick: Tropical ferns differ little in their cultural requirements from the general stock of stove plants. In consequence of the more delicate texture of their fronds, they should have rather more shade than is advisable for crotons and dracænas, but from recent experience it has been found that ferns require much less shading than was considered necessary for their well being. When grown in a house by themselves a permanent shading, either of canvas or some wash may be used, although roller-blinds are preferable. Adiantum cuneatum, and other ferns grown for the supply of fronds for arranging with cut flowers, should have plenty of light without exposure to the direct rays of the sun, as the fronds will then be firmer and stand better. Ornamental-leaved begonias thrive under the same conditions as the majority of ferns, and when planted in association with them, they grow vigorously, affording a charming diversity of leaf colouring, and presenting a delightful contrast to the elegant aspect of the ferns.

DYING PEACH BRANCHES.—Almond, Matlock: The shoot sent indicates a very unsatisfactory state of affairs. The tree has evidently been badly managed in the past, and this mismanagement has spoiled its constitution. Probably the soil is poor and has lacked moisture. There is no fungus growth present, but there has been a good deal of gumming; it is also likely that mismanagement has had some effect upon the junction of stock and scion, thus still further weakening the tree. Root out the tree, and in the autumn plant a thriving young tree in new, sweet soil.

NAMES OF PLANTS.

A. G. R., Islip.—A, Staphylea colchica; B, S. pinnata.

B. J., Caversham.—1, Pyrus Scheideckeri; 2, Rubus deliciosus.

J. R., Halifax.—1, Thuia dolobrata; 2, Cupressus Lawsoniana erecta viridis.

H. A., Gloucester.—1, Odontoglossum ardentissimum; 2, Sophronitis grandiflora; 3, Masdevallia ignea.

S. G., Horsham.—1, Saxifraga Stracheyi; 2, Ginkgo biloba; 3, Exochorda grandiflora; 4, Cytisus præcox.

M. V. R., Richmond.—1, Rhododendron Veitchi; 2, Primula japonica; 3, Androsace Chumbyi; 4, Saxifraga decipiens.

S. C., Bristol.—The specimens sent were very poor ones, and, being packed in dry moss and paper shavings, they were badly shrivelled on arrival. No. 1 we do not recognise; 2 is probably Pyrus Scheideckeri; and 3, a form of Pyrus malus.

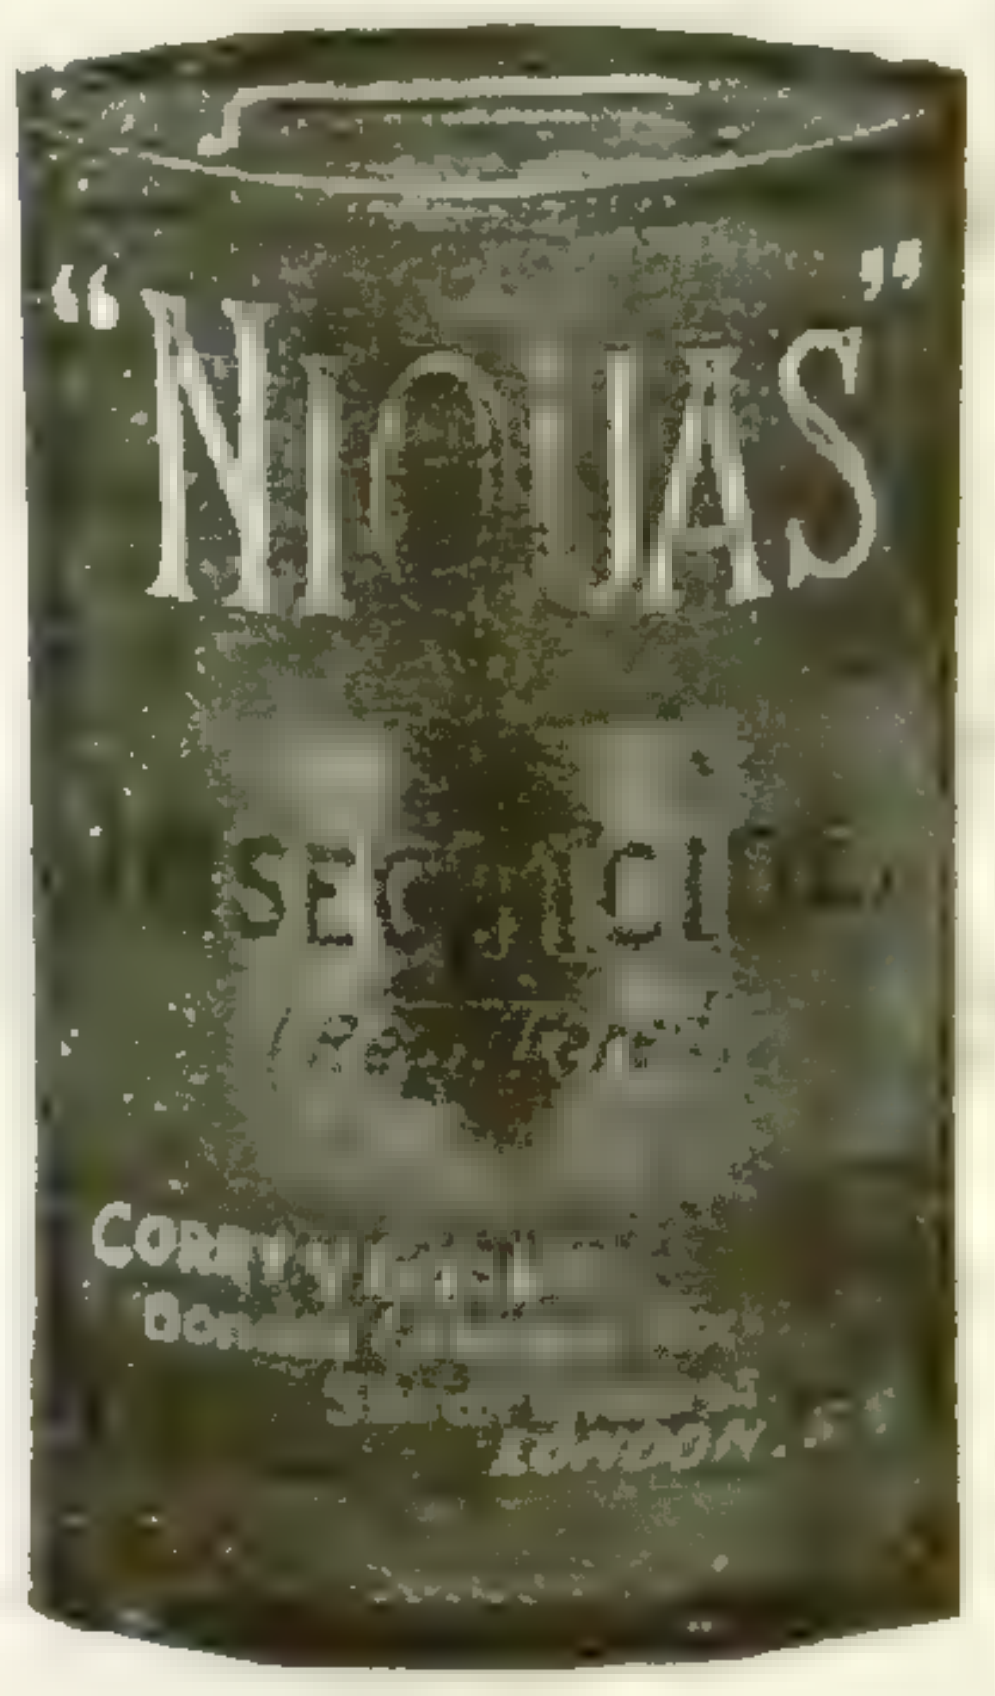
IMPORTANT TO GARDENERS AND FRUIT GROWERS.

'NIQUAS'



(REGISTERED).

The most successful Non-poisonous Insecticide of the day.

ITS ADVANTAGES ARE—

Certain Death to all Insect Pests.

No possible injury to the most delicate Plant, Flower, or Foliage.

It is by far the Cheapest Insecticide known. One pint makes 10 to 12 gallons for Thrip, Black and Green Fly, etc., whilst RED SPIDER, Mealy Bug, and Scale can be thoroughly eradicated by using "NIQUAS" about double the strength required for Fly.

It is most successfully used by Orange and other Fruit Growers in the Colonies, etc.

PRICES.—Pint, 1/-; Quart, 1/9; ½-Gal., 3/-; Gal., 5/-; Kegs, each, 5 gals., 22/6; 10 gals., 42/6.

Ask for Testimonials, of which some hundreds have been received.

Specimen Testimonial.

From Mr. E. HUBBARD, Gardener to G. Hanbury, Esq., Blythewood, Burnham, Bucks, May 15th, 1906.

"I have been using your '**NIQUAS**' **Insecticide** for some years, and can with all confidence say it is the best I have ever used for Bug, Thrip, Red Spider, American Blight, and for all Insect Pests it has no equal. Also for the destruction of Maggots in Marguerites by dipping. I have recommended it to my friends generally."

TO DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialties are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WEED KILLER used once a year. "No weeds can live." RICHARDS' ARSENATE OF LEAD for all leaf-eating insects. CUCASA (fungicide), the finest preparation of copper ever offered to gardeners. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234 Borough High Street, London, S.E.

THE QUEST FOR INFORMATION.

It has often been a search amidst difficulty, and even vicissitude, but we have pursued it, and, in the end, we have always been rewarded.

True of the great purposes of life, it is equally true of the work that claims our service, or attracts our leisure; for, in order to do well, we must know the way to do it. To adapt the quotation to our own end, "To Grow or not to Grow, that's the question." Which simple sentence serves as a contrast in words that expresses the difference between knowledge and ignorance.

Upon which side of the contrast are we working? You and I? Within us the inborn desire to excel: How may we do so? The question is one of means. Indeed, we need but to handle the opportunity. The means are at our side. To-day, we have our information in a nutshell; that is to say, the reader of "CLAY'S SUCCESSFUL GARDENING" obtains for the small sum of NINEPENCE a gardening library, each page of which is full of the very information he needs—a horticultural library within the compass of a single volume.

The lately published fourth edition of this book contains 276 pages of knowledge that will be power to us, if we but take the simple means to possess it. Whether growers of rare and exotic varieties, or cultivators of the garden simply for general effect, the work will guide us by many a suggestion, for THE GARDEN UNDER GLASS and THE GAY GARDEN sections are full of instruction upon these subjects. The culture of FRUITS and VEGETABLES is made easier for us by capable writers. For the specialist there is the latest cultural detail, and the most recent selections are given of the following popular Flowers and Fruits: Begonias, Carnations; Chrysanthemums; Daffodils; Dahlias; Lilies; Roses; Sweet Peas; Violas and Pansies; Bulbs; Cucumbers, Melons, and Tomatoes for Profit. This list does not exhaust the many subjects treated of. For practical arrangement of areas devoted to garden cultivation there are such treatises as: Indoor Gardens; Suburban Gardens; Rock Gardens; Practical Work, simplified by means of detailed descriptive and outline sketch; Insect Pests and Their Extermination; Work for Every Month; Hints upon Sowing Flower and Vegetable Seeds.

For the Exhibitor there is a complete vade mecum provided in the noticeable contribution by the veteran journalist and judge, Mr. John Wright, V.M.H., entitled "GROWING AND SHOWING." If a lifelong devotion to horticulture and a repute of the highest be a qualification, then here is the writer, and here his work. "Points for Exhibiting and Rules for Judging" are stated and developed with admirable judgment and deliberation.

Other timely topics comprise: Flowers that are Fragrant and Poisonous—in the latter case with antidotes for use in the event of a doctor not being available.

A Remarkable Companionship.

Contributors to "CLAY'S SUCCESSFUL GARDENING" are men of eminence in horticulture. Each undertakes a portion of the work with the success of which his name is more closely identified, so that in an age of specialists the book is a symposium, published in book form, issued at the price of a pamphlet.

"Was ever such a companionship met before?" Let the list suffice: George Gordon, V.M.H., F.R.H.S., T. W. Sanders, F.L.S., F.R.H.S., etc., James Hudson, V.M.H., F.R.H.S., James Douglas, V.M.H., F.R.H.S., Edwin Beckett, V.M.H., F.R.H.S., John Wright, V.M.H., F.R.H.S., J. Fraser, F.L.S., F.R.H.S., and the following Fellows of the Royal Horticultural Society—all well-known writers: C. H. Curtis, J. Harrison Dick, E. H. Jenkins, E. F. Hawes, Horace J. Wright, J. Udale, W. Iggulden, H. Hemsley, and Mrs. Richmond. Other contributors include Messrs. H. C. Prinsep, H. Shoesmith, and G. Trinder.

Where to Obtain It.

The book is published by Messrs. CLAY and SON, the Proprietors of CLAY'S FERTILIZER, Stratford, London, E., and NINEPENCE procures you an illustrated volume of 276 pages, neatly bound in green cloth. Your seedsman or nurseryman will hand it to you for this small sum; or, if unable so to obtain it, you may have it placed upon your table, post free from the publishers, by sending this amount to them direct, addressed as above.

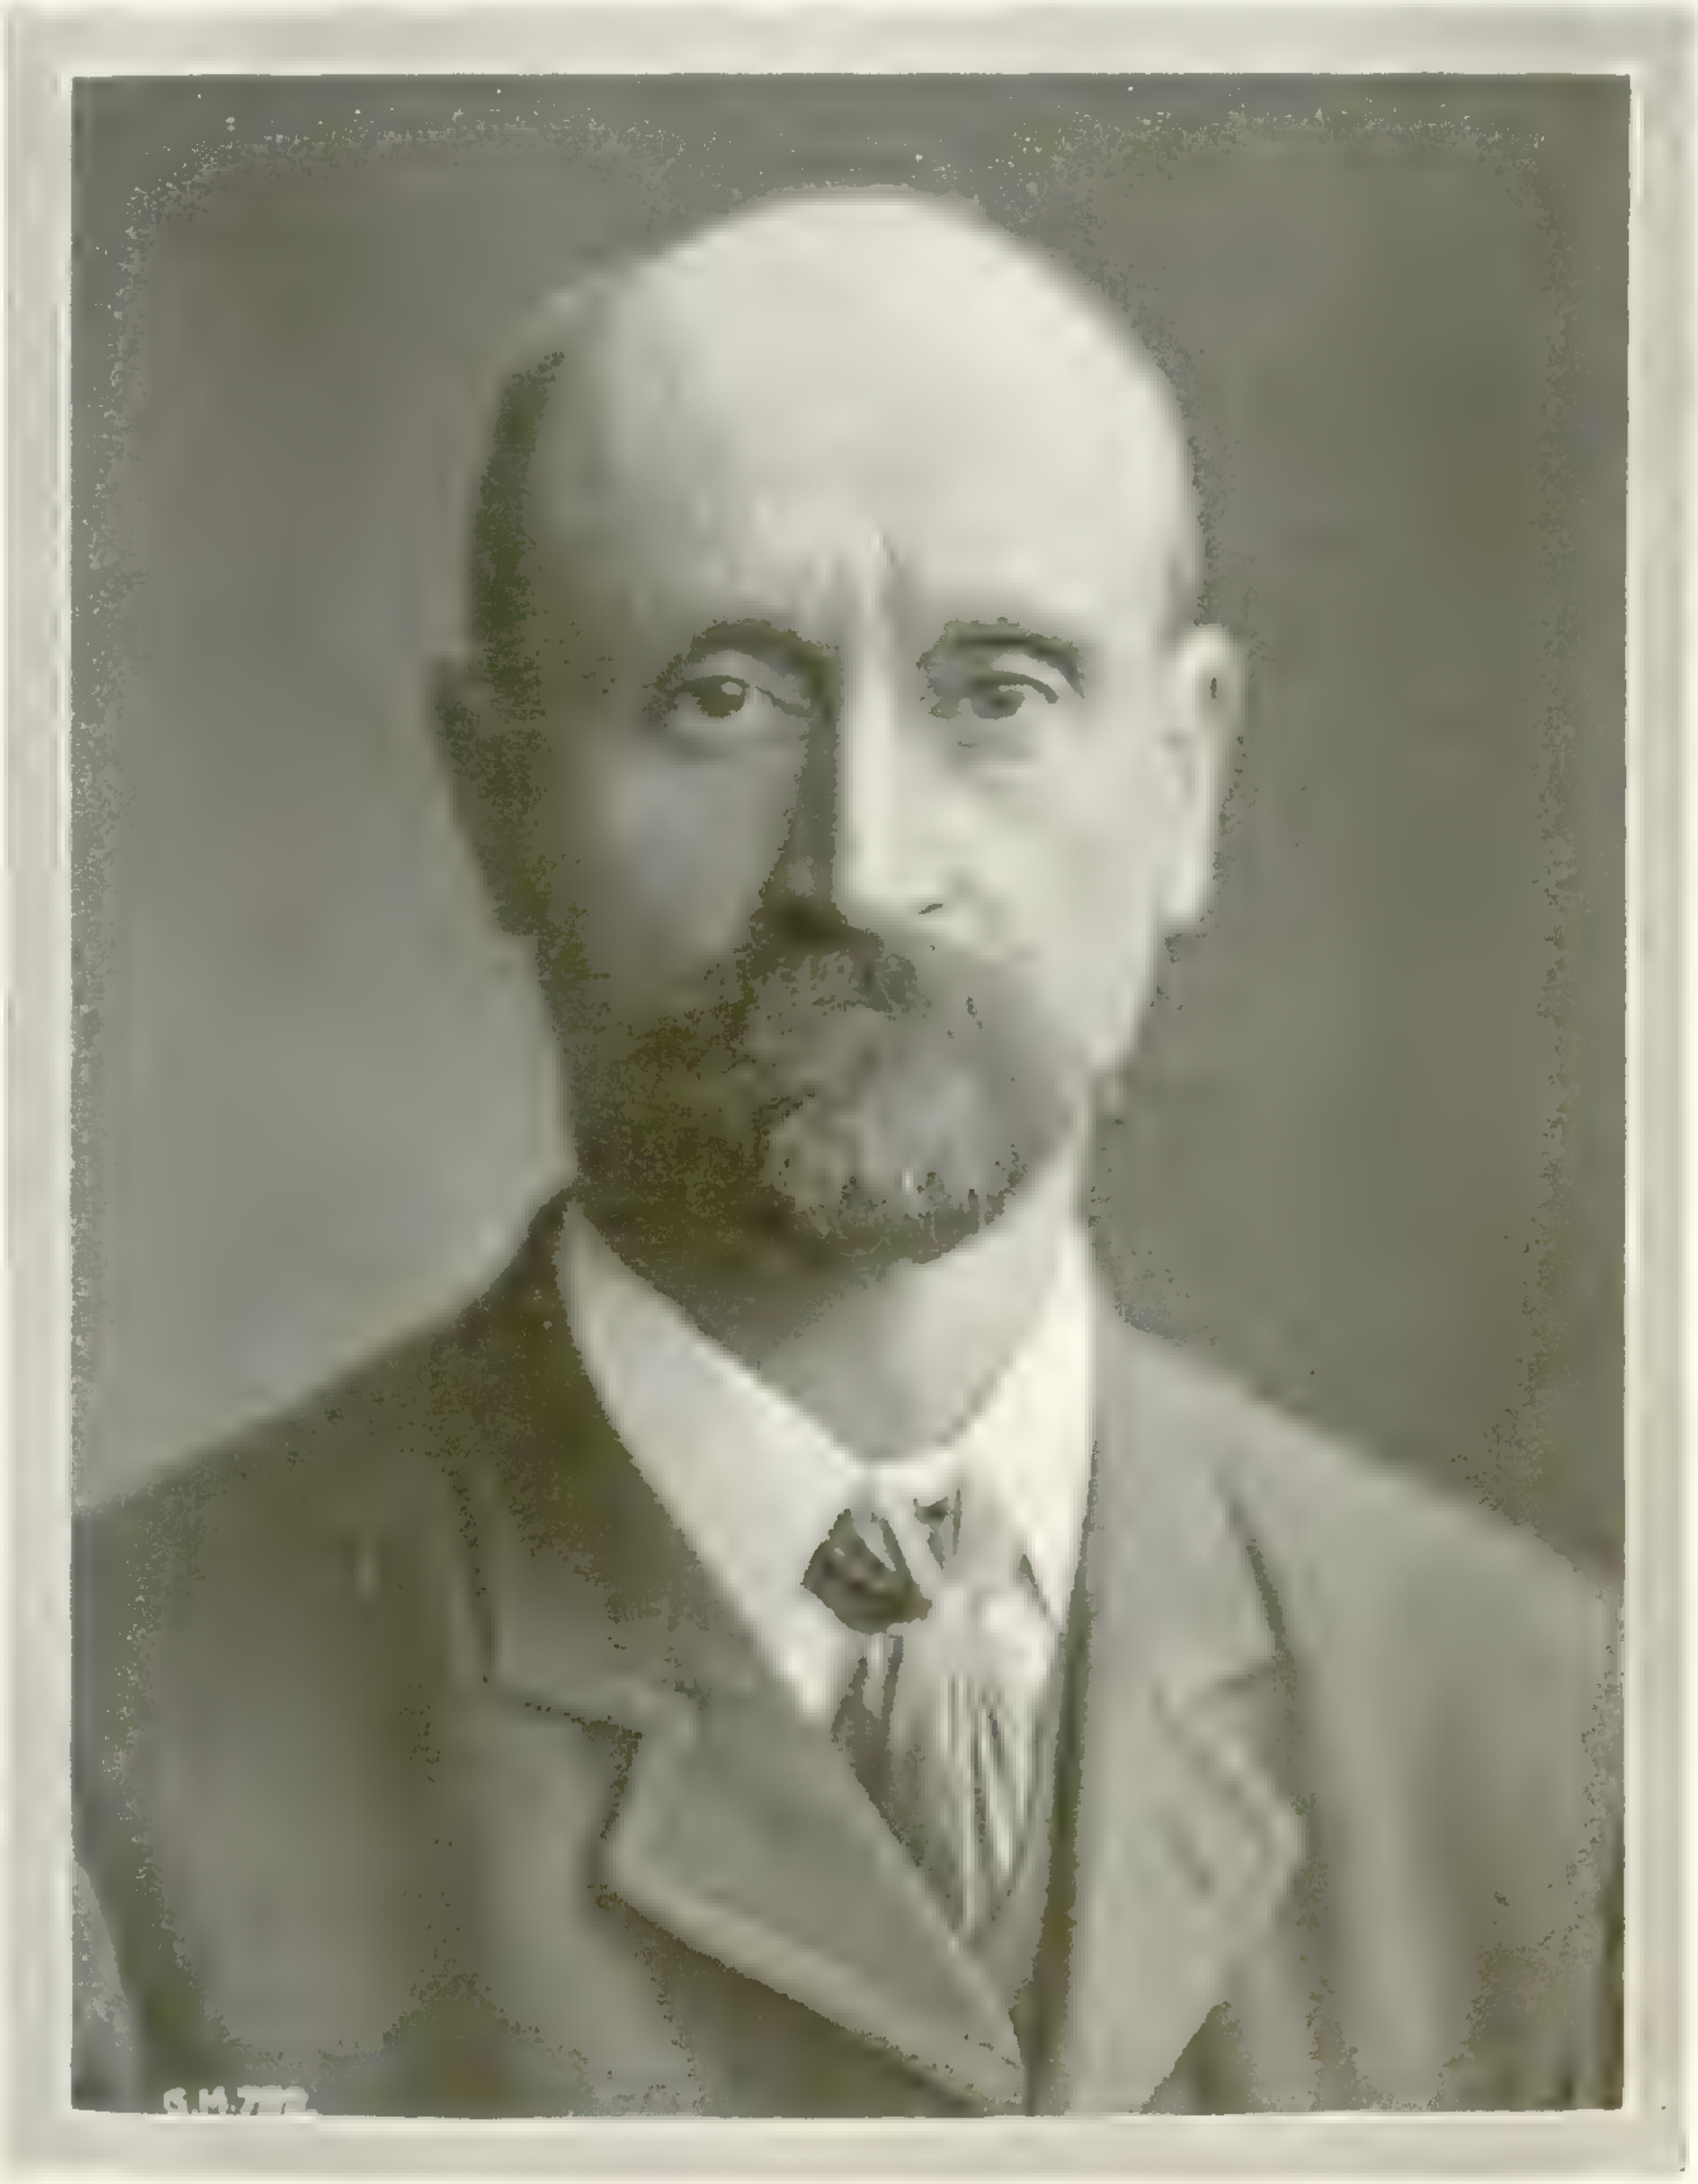
THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

The Royal Botanic Society.



MR. ARTHUR K. BULLEY.

The financial position of the Royal Botanic Society, as disclosed by the figures given at the extraordinary meeting of the Fellows held on the 25th ult., and referred to in our last issue, was sufficiently serious to justify the gravest apprehensions on the part of those who are especially interested in the society. Unfortunately, the position is more serious than was indicated by those figures, and the Fellows will have to provide a much larger sum than was anticipated in order to enable the society to meet its liabilities during the current year. At the meeting mentioned above Mr. Brinsley Marley, the treasurer, who presided, stated that the liabilities, including rent, wages, and office expenses to the end of the year, would amount to about £5,000, and that the Council hoped to receive from fêtes, subscriptions, etc., about £2,000, leaving an adverse balance of about £3,000 to be met. The Council proposed, as the best means of paying off this large sum, that each Fellow should make a donation of five guineas. To this proposition an amendment was moved by Mr. Cecil Raleigh that the Fellows be invited to contribute five guineas each. The amendment was carried, and on the 28th ult. a meeting was held for the purpose of confirming it. At this meeting Mr. Brinsley Marley again presided, and at the commencement of the proceedings he stated that the figures given on the previous Tuesday were not accurate, and that the financial position was more serious than they had thought to be the case. That such a statement should have been necessary is difficult to understand, because it is not unreasonable to suppose that before the Council called the Fellows together for the purpose of inviting them to provide the funds necessary to meet the year's liabilities a very careful estimate of the financial position would have been prepared. The total liabilities, he said, amounted to £8,656, or about £3,656 more than previously estimated. The details of this large sum included: trade accounts, £1,727; rent, rates, and taxes, £1,187; loans from the bank, £1,942; loans from the members of Council, £1,300; loan from Mr. Brinsley Marley, £1,050; and the estimated expenses of the garden to the end of the year, £2,500. The estimated receipts were £308 from subscriptions, £700 from garden parties, £300 from the refreshment contract, and £200 from golf. Assuming the estimated receipts to be realised, the deficiency will be £7,148, a sum so large as to give rise to a feeling of doubt as to whether it will be raised by donations. In referring to this point Mr. Brinsley Marley said that if the 1,484 Fellows and Life Fellows gave a donation of five guineas each, a sum of £7,686 would be produced. As showing the urgency of the case, Mr. Brinsley Marley stated that two days before the meeting a writ for £400 had been served, and if the members of council had not provided the money, the gardens might have been closed. In addition to the liabilities for the year, there is a debenture debt of £25,000, and it was suggested that as the assets would not exceed £5,000, the debenture holders would do well to meet and consider the present position. At the close of the discussion, Mr. Cecil Raleigh's resolution, "That in order to relieve the society from its grave financial position, and enable it to carry on its work, each Fellow do subscribe a minimum sum of five guineas to the fund necessary to protect it from bankruptcy," was carried unanimously, and with some signs of applause. Should the whole of the Fellows act in accordance with the resolution and give a donation of five guineas each, the society will be placed in a position to pay its way and to retain the possession of the gardens for another year. This, we hope, may be done, in order that the society may have time for fully realising its position, and making such changes in its constitution and policy as will restore, in some degree, at least, its vitality, and place it in a position to again engage in useful work. The Royal Botanic Society has accomplished much splendid work in the advancement of horticulture during the seventy odd years of its existence, and, with its unique opportunities, it should now occupy a high position among the leading horticultural societies of the United Kingdom. Unfortunately, its governing body have not for a comparatively long period been sufficiently in touch with botanical and horticultural activities to be in a position to appreciate the changes that have been in progress during the past quarter of a century, both in the public taste and methods of procedure in the garden. Consequently, when the Fellows and the flower-loving public became somewhat tired of the specimen plants and other objects that had constituted the chief features of the exhibitions held during the first half century of the society's history, such changes as were made were not sufficient to enable the shows to retain their hold upon public attention. The result has long been known to those who take an active interest in horticultural matters, and is brought prominently into notice by recent events. What steps should be taken with a view to the restoration of the society to a position of usefulness is fairly clear to those who are fully acquainted with the trend of public opinion in relation to horticulture, and who are also able to appreciate the teachings of history. Whether the work of reform will be entered upon vigorously by those responsible for the conduct of the Royal Botanic Society, or whether the policy that has brought about the present unsatisfactory state of things will continue, it is impossible to say. We are not very hopeful as to the future of the society, because the greater part of those upon its Council, and those whose voices are ever lifted up in opposition to whoever is in power, are in no sense closely associated with either horticultural or botanical pursuits.

Mr. Arthur K. Bulley, whose portrait we present in the present issue, is a remarkable man. He has for long been an enthusiast in matters horticultural, and he has a wonderful and interesting collection of plants in his garden at Mickwell Brow, Ness, Cheshire. No stately terraces or gorgeous and formal flower garden adorn the front of his house, but there are great masses of golden furze just where they were when the builder commenced operations near by. The general arrangement of the garden is unique, and gives evidence of the owner's love of the natural and distaste of the artificial. A notable feature is the arrangement of plants that bloom together in certain months of the year, so that every month, from earliest spring to latest autumn, there is one border always at its best. Mr. Bulley's enthusiasm and love of plants led him some few years back to send Mr. Forrest out to China and Thibet, to travel in search of new and rare plants. His enterprise has been greatly rewarded, as our columns have testified, but there are more good things to follow. The same enthusiasm and a desire to provide work for as many men as possible, led Mr. Bulley to establish the nursery and seed business known as Bees, Lim., of Sealands, Chester, and Liverpool. Mr. Bulley is an idealist and a strong believer in that socialism that aims at giving all possible help to those who are willing and able to profit by it, and then do their share in helping others. There is room for many more men of Mr. Arthur K. Bulley's enthusiastic and enterprising stamp. We may add that Mr. Bulley is a cotton broker in Liverpool, and that his fine garden at Ness, overlooking the Dee and commanding grand views of the Welsh Hills is always open to the public, and at the entrance gate is a prominent notice announcing, "All are welcome. Please keep to the paths."

Dublin Gardens.—We shall give an illustrated account of the gardens in and about Dublin in the issues of the Gardeners' Magazine for June 19 and 26. The gardens illustrated and described will include those of Powerscourt, Kilruddery, Carton Park, and Straffan House; and the Glasnevin Botanical Gardens and the People's Garden, Phœnix Park.

Gardeners' Royal Benevolent Institution.—The seventieth annual festival of this excellent charity is to be held at the Hotel Metropole on June 23, and the chair is to be taken at 7 p.m. by Lionel de Rothschild, Esq., who has just issued the following earnest appeal: "As I am to have the pleasure of presiding at the seventieth anniversary festival dinner in aid of the funds of the Gardeners' Royal Benevolent Institution, on June 23 next, at the Hotel Metropole, I venture to ask for the kind assistance and support of all lovers of flowers and gardening. This national horticultural charity whose cause I have undertaken to plead, has been established seventy years. During this time it has distributed £122,000 to gardeners, horticulturists, and their widows in distressed circumstances, and is now affording permanent aid to 241 persons—men and widows—at an annual cost of over £4,000. To meet this expenditure the only assured income is about £950. The remainder has to be made up by subscriptions and donations, and it is to this end that I am earnestly soliciting your generous aid. In addition to its expenditure in permanent allowances, the charity also gives immediate temporary assistance in pressing cases of distress amongst gardeners and growers, as well as florists. I may mention that the Prince of Wales is president of the charity, which for many years has enjoyed the patronage of the Royal Family. I hope very much that you will be able to accept the accompanying invitation to the dinner, but, if you are not able to do so, may I have the pleasure of adding your donation to my list?—Believe me, yours faithfully, Lionel de Rothschild."

The Masters' Lectures.—The first of the series of Masters' Memorial Lectures, to commemorate the late Dr. Maxwell T. Masters, is to be delivered on June 22 at the Royal Horticultural Hall, Vincent Square, Westminster, at 3 p.m., by Professor Hugo de Vries. The lecture is entitled "Masters' Vegetable Teratology." The president, Sir Trevor Lawrence, Bart., will preside.

Trial of Perpetual-flowering Carnations.—The Perpetual-flowering Carnation Society has decided to hold a trial of perpetual-flowering carnations in the open ground at the Royal Botanic Gardens, Regent's Park, in order to test the suitability of varieties for open-air culture. Members of the society who decide to take part in this trial are requested to forward plants to Mr. E. F. Hawes, at the above address, who has undertaken to conduct the trials. Plants should be forwarded carriage paid as early as possible, and a list of varieties sent by each member. The trials will be inspected by the Floral Committee, marks given according to merit, and the results issued in due course.

The Temple Show.—With reference to their absence from the Temple Show, Messrs. Kelway and Son write: "As we have been asked why, after exhibiting for so many years at the Temple Show we have not done so this year, and as our absence may give rise to comment injurious to our interests, we should like to be allowed to explain that we withdrew our application and ceased our preparations when we found that only 30 square feet (about 7½ft. by 4ft.) of space could be allotted to us. The smallness of the area given to us last year (50 square feet) created an impression sufficiently detrimental to our business. We are glad that the show is so deservedly popular, but are sorry that an area sufficient to show off leading exhibits cannot in each case be provided, and that therefore, for the first time, we were not able to be represented. We were not present, but we are told that large banks of strains of seedling plants and other groups or exhibits which were accepted from other firms, occupied considerable space, and were naturally much admired. We should add that in response to our protest we were offered, on Saturday evening, 90 square feet, but this was too late for us to prepare and send an exhibit for the show which opened on the following Tuesday."

Rhododendrons at Regent's Park.—Messrs. John Waterer and Sons, of Bagshot, are again holding a magnificent exhibition of rhododendrons in the gardens of the Royal Botanic Society, Regent's Park. The plants are set out in beds and borders, so as to produce a rhododendron garden, and this garden is under canvas. The exhibition opened on June 3, and will continue throughout the present month.

Pansies and Violas from Hawick.—From Hawick, Mr. John Forbes sends us a large gathering of pansies and violas, which for many years past have formed an important feature in his well-known nurseries. Mr. Forbes has achieved much success as a raiser, as well as a cultivator of these two classes of flowers, and the blooms now before us exemplify the great wealth of his collection in varieties of quite exceptional merit. The violas show how wide is their range of colouring, and how admirably adapted are both the selfs and the varieties having more than one shade of colour in their flowers for the embellishment of beds and borders. The attractive combinations of colours afforded by the second of the two at once attract attention, while the selfs impress one by their usefulness in the production of broad colour effects in the garden. Prominent among the selfs are Purity, white; Sir Robert Pullar, Ariel, and Max Kolb, various shades of blue; Pembroke and Royal Sovereign shades of yellow; John Forbes, royal purple; and J. B. Riding, bright claret. Especially noteworthy among the fancy pansies, which have now attained to a high state of development both in form and colouring, are Kayii, Earl of Annesley, Lusitania, Gabriel, George Peacock, Elliott Murray, James Wigan, and Beatrice. It is gratifying to know that pansies and violas are rapidly increasing in popularity.

Messrs. Dobbie and Co., Rothesay, are a title and address that has grown wondrously familiar during recent years, but while the title is likely to remain for long years to come, we shall soon be wanting to forget the above address. In short, the headquarters is to be moved from Rothesay to Edinburgh. Several years ago the firm had large seed grounds in Hampshire, and then it developed a farm at Orpington, but now it has its own property at Marks Tey, Essex, where both flower and vegetable seeds are extensively grown, and the whole place is kept in fine style. The move of the headquarters from Rothesay to Edinburgh marks another stage of the enterprise that has characterised the firm ever since Mr. W. Cuthbertson became senior partner.

Experiments at Woburn.—The experiments that will be carried out at the Woburn Experimental Station during the current year include, (1) an extensive series of trials on field crops of the two new nitrogenous manures, nitrate of lime and calcium cyanamide, as compared with nitrate of soda and sulphate of ammonia; (2) the inoculation of leguminous crops (lucerne and white clover); (3) further trials with magnesia in different forms, including magnesian limestone and magnesium lime, on potatoes; (4) experiments on grass land to test the difference in (a) continuous mowing, (b) continuous grazing, and (c) alternate mowing and grazing.

Duke of Bedford's Thorney Estate.—About 12,000 acres of this estate has been bought by the Commissioners of Woods and Forests, the limit which the funds at their disposal will allow. The tenants of the remaining 7,000 acres have been informed that they have the first option of purchasing their holdings.

NOTES FROM THE SAAS VALLEY.

A goodly proportion of the thousands of persons who visit Zermatt are unaware that at Stalden, the first station on the Zermatt Railway after leaving Viege, in the Rhone Valley, another long and romantic valley descends to meet the main Visp Thal. This, the Saas Valley, is the last of the many valleys south of the Rhone before the Simplon is reached, the famous pass through which the long tunnel was pierced a few years ago.

The wonderfully engineered Zermatt Railway was built on the Abt system, to avoid the necessity of making costly cuttings and embankments, which would have been the case if a regular gradient of 1 in 36 had been chosen, the difference in level between Viege and Zermatt being 3200 feet; but by the Abt system of two central lines of alternate teeth fitting into cogs underneath the carriages, various degrees of inclination may be surmounted without danger, and this railway, in some places, rises as much as one foot in eight.

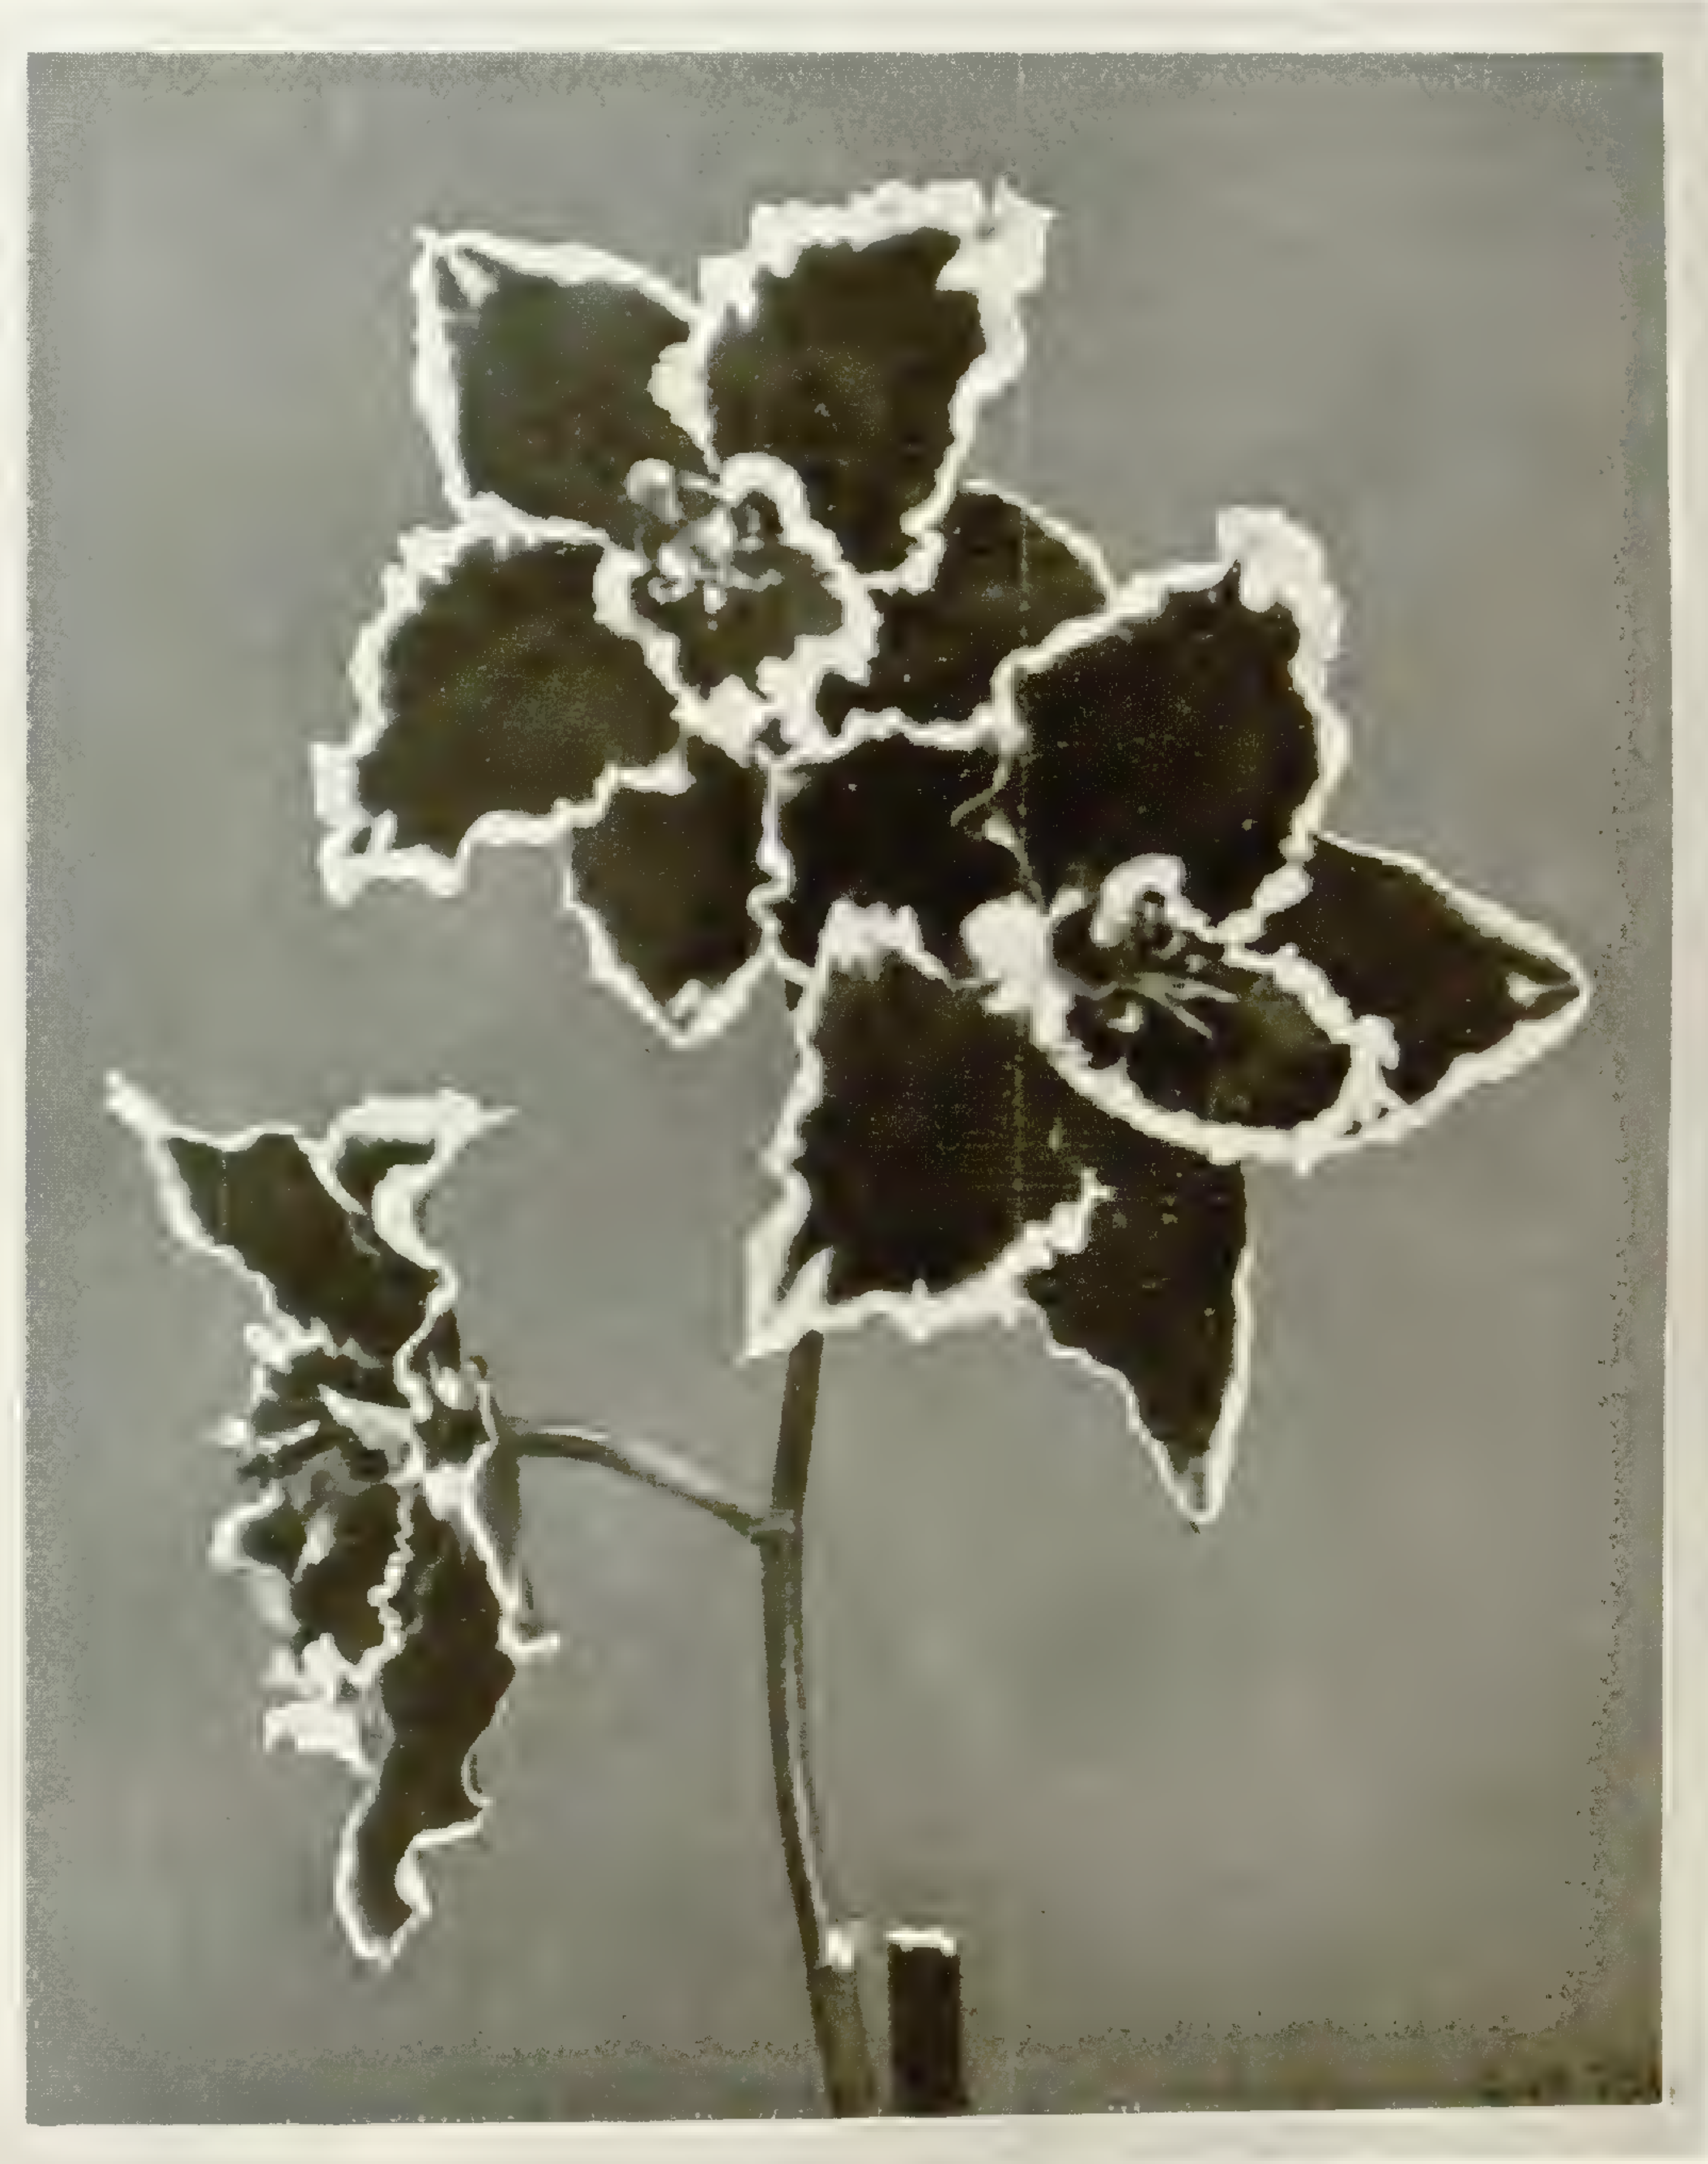
On leaving the railway at Stalden, where one's luggage may be posted to Saas Grund or to Saas Fee, according to which place one decides to stop at, the only road is a good mule path, up which everything is carried on muleback. Vines are left behind, and so are such sun-loving plants as Ononis Natrix, Medicago falcata, Delphinium Consolida, and Colutea arborescens with its large, dilated capsules. The river Visp is crossed by a single span 150 feet above the torrent below; then the path rises rapidly, and good views are obtained of the mountains north of the Rhone, the prominent pyramidal peak of nearly 13,000 feet being the Bietschhorn. The Saas Valley runs nearly north and south, and it extends from Stalden to the Monte Moro Pass, on the Italian frontier, leading down to Macunaga. The greater part of the valley as far as Almagell is fairly populated and extremely picturesque, but the upper portion is very wild and sterile, and probably was never permanently inhabited, though there is a collection of rude stone huts as far as the Distel Alp, which is 7,120 feet above the sea, and about an hour beyond the desolate Mattmark Lake. One of these huts bears the date 1774, and another 1835, but all were totally unoccupied by men or cattle in the middle of June last.

The first village between Stalden and Saas is called Eisten, and shortly afterwards the little hotel at Hutegg comes in sight, and it is the only inn between Stalden and Saas. About here may be found Pyrola uniflora and P. minor, Geranium [illegible], Erysimum pumilum, Lychnis Flos-Jovis, Orchis sambucina, Pedicularis [illegible], etc. Cattle are grazing on the available patches of herbage, and they seem [illegible] in the first few weeks of their [illegible], after having been confined all the [illegible] months in their too small and stuffy houses. These patches of pasture in the valleys are called Vorsassen, and every [illegible] in a Swiss valley has certain rights [illegible] pasturage on certain Vorsasseu, where [illegible] eat as much fresh grass as they [illegible] before they are driven up to the [illegible]. An "alp" is a mountain pasture used in summer, and sometimes in [illegible]-speaking Switzerland it is called [illegible]. A day, varying according to [illegible], is fixed by the owners of these [illegible], but not before which the cows may be sent to the alps; this event is called [illegible] "Alpfahrt," and it generally takes [illegible] in the first half of July, and the [illegible] the cows are on an "alp" is about sixty days each summer, for by the middle of September they are generally on the Vorsasseu again, where, in some cases, they remain throughout the winter in stables, without being brought further down the valleys.

When the cows are taken up to the highest alps many frequently go together, accompanied by men or boys to look after and milk them, and to make the cheese; and, previously, they have been busy taking to the lowest huts on an "alp" the great copper utensils used for cheese making. But on the Vorsasseu of the Saas Valley women or girls are generally in charge of the cows, which are usually in ones, twos, and threes, and as the women spend most of the day in this way they are frequently seen with their knitting, and tending a small child or baby, as well as a cow or two. In this valley it is quite a common thing to meet a woman smoking a clay or a briar pipe.

The houses in the Saas district are typical Swiss chalets of wood, which, toning to a rich dark brown, afford so picturesque a feature in the landscape, familiar to every visitor to Switzerland. Often the chalets are built on a stone foundation, the ground floor being usually occupied by the cows and goats, and frequently an indescribable medley of objects, both living and dead, may be seen there. The smaller chalets are almost always of wood alone, and sometimes they are pitched high above the damp ground on short stone pillars surmounted by a round flat piece resembling a mushroom, just as occasionally in England ricks of hay and straw are raised above the ground and the ravages of rats.

Above Hutegg some of the rocks in the stream have been hollowed in an extraordinary manner by the torrent, reminding one of the way in which deep holes or "moulins" have been scoured out by stones whirled round and round by the force of water at the bottom of a glacier, and so well seen in the glacier garden at Lucerne. The flora becomes more alpine here, Lilium Martagon and the beautiful Aquilegia alpina being seen in places. A fine waterfall leaps over the cliff on the west, and one of the typical wooden bridges crosses the river here, and in the stony bank beside it were masses of the beautiful deep pink blossoms of Primula viscosa, while the great sulphur anemone formed an exquisite object in the pasture adjoining. Yellow daffodils, just as they grow in England, were in full bloom early in June in a meadow nearer Saas Fee at 5,800ft.



TEMPLE SHOW—ODONTOGLOSSUM PRINCESS VICTORIA ALEXANDRA.
A handsome hybrid with finely-formed flowers, deep red-brown, margined with blush.
Shown by Mr. C. Vuylsteke. F.C.C., R.H.S., May 25. (See New Plants.)

In about three and a-half hours' steady walking from Stalden Saas Grund or Sass im Grund is reached. The word Saas is probably derived from the Italian Sasso, meaning a stone, for the valley is very stony, and Saas is a relic of the Italian colonisation of the valley in the thirteenth century, but later Teutonic influence has so altered the local names that it is often difficult to make out their original Italian form. The word Grund means the flat part of a valley.

Saas is a dirty village, 5,125 feet above the sea, but the Hotel Monte Moro is clean

TEMPLE SHOW—CARNATION CAROLA.

A remarkably distinct and beautiful perpetual-flowering variety: the flowers large, of fine form, and the colour bright vivid crimson. Shown by Mr. C. Engelmann, A.M., R.H.S., May 25. (See New Plants.)

and comfortable, and in the neighbourhood of scenery of the first order, but it is necessary to walk ten minutes further up the valley to obtain the magnificent view of the grand circle of mountains comprising the Täschhorn and the Dom. The Dom is the highest mountain entirely in Switzerland, for although the supreme summit of Monte Rosa is in Swiss territory, much of the mountain is within the Italian frontier, as every schoolboy knows. In the valley just above Saas two rare Arctic plants have been found—Carex incurva, which was first discovered in Scotland and named by Bishop Lightfoot, is very rare in Switzerland. Pleurogyne carinthiaca is an even scarcer Arctic plant. It resembles a large-flowered Gentiana tenella, and grows in similar damp places. The larger Swertia perennis of like situations might be cultivated in English water-gardens, for it is a distinctly handsome plant. Astragalus alpinus, Phaca australis, and Androsace septentrionalis also grow here.

Although several large hotels at Saas Fee, 700 feet above the valley, have deprived Saas of any great importance as a climbing centre, some people prefer the lower village, with its peaceful valley bounded by pretty fir woods and small fields of cultivated ground, to the shut-in and more savage appearance of Saas Fee, which has no luxuriant pine forests in the foreground to set off the splendid array of glaciers and monster peaks. Instead there is a somewhat dreary monotony of moraines descending from the glaciers, for these glaciers have been retreating for about thirty years, and parts of the huge moraine, where once a glacier descended quite close to the village, are now sparsely covered with larches of spontaneous growth, some of the trees being already twenty or twenty-five feet high.

Above Saas we find Draba incana, D. carinthiaca, Oxytropis campestris, O. Halleri, Aretia Vitaliana, and many other interesting plants; while in June the Gletscheralp is decorated with the beautiful blossoms of Primula longiflora mingled with anemones.

In ascending above Saas Grund towards the Mattmark Lake there is only one village, at which spot a fine cascade descends. The route becomes wilder and wilder, and early in the season one has to cross, not without some difficulty, the remains of avalanches of snow, or of snow and rocks and mud. Just at the top limit of the larches, at about 6,600 feet, a huge moraine descends to the west side of the stream, forming a great expanse of scree of enormous height. Then a fine hanging glacier empties its lower end into the actual stream below the path, and some black alpine choughs are seen sailing slowly over the ice. On the return journey these birds were, curiously, replaced by numbers of alpine swifts flying over the glacier. There is another moraine on the north side of the Allalin glacier which shuts in the Mattmark Lake.

The Mattmark See is a small lake, about a mile long, but greatly silted up with sand, so that it appears very shallow. The path which skirts the east side is in June frequently embedded in avalanches, so that the greatest care is needed, for it is so easy to sprain an ankle, if no more, in places of this sort. At last we arrive at the little Mattmark Hotel (6,966 feet), which is not yet opened for the season, and a hundred yards beyond is the famous Blauenstein, a huge boulder of green serpentine about fifty feet high, which, with two smaller masses near by, have been carried down by one of the glaciers when, during the early part of last century, it extended into the plain.

The flora near the lake is interesting, and it comprises the lovely pink Saxifraga oppositifolia, a plant which extends well within the arctic circle in Spitzbergen and elsewhere; Ranunculus pyrenæus and R. glacialis, gentians, anemones, pink and red primulas, mezereon, the rare little bulbous Lloydia alpina, occasionally seen on Snowdon and in the Scotch Highlands, and a species of gagea carpets the ground with its bright yellow star-shaped flowers.

Amidst the wildest scenery the path continues as far as the Distel Alp, where, as already mentioned, are some rude stone huts of exactly the same colour and material as the surrounding rocks, and being built into the natural contour of the ground so that the snow shall easily fall off them, they are hardly visible at a short distance. These huts usually have a small cowhouse on either side of a sleeping-room, approached by three or four outside steps and often there is a sort of kennel for the goats all under the same roof.

About two more hours over the snow slopes and we are on the top of the Monte Moro Pass, from which is obtained one of the very finest views in the whole range of the Alps.

H. Stuart Thompson.

Tibouchina semi-decandra. This is our old friend Lasiandra macrantha or Pleroma macrantha, under which name it became popular many years ago. There was, however, and still is a widespread idea that it must be considered as a warm house plant, yet at Kew, where it is employed to clothe the end of the greenhouse, it has mounted up to the apex of the roof, is in robust health, and in its season of flowering is profusely laden with its rich purple blossoms. It is certainly one of the finest plants we have for such a purpose, and is at its best when many of the summer occupants of the greenhouse are on the wane. There is a variety known as floribunda, which blooms more freely in the shape of small plants than the type, but for clothing the roof or end of a greenhouse the typical kind is preferable.—W.

Gillenia trifoliata is a valuable plant for grouping among moisture-loving subjects. It starts late into growth; [illegible] at any rate, it is later than the spiræas, and produces slender purple-red stems clothed with small spiræa-like foliage coloured similar to the stems, and in moist ground it reaches three feet in height. The flowers are produced upon the extremity of the current shoots, and are white, with a strong tint of the rose. The greatest beauty of the plant lies in the leaf colouring, which is most pronounced at the extreme periods of vegetative growth. In summer the foliage is a [illegible] russet-brown, but with the advance of autumn this colour changes to purple and crimson, the richest colours predominating in positions fully open to sun, and at that season it is conspicuous among herbaceous subjects. The coloured stems and leaves are often prized when cut for associating with flowers or other autumn-tinted foliage.—Thomas Smith, Walmsgate Gardens.

TURNIPS.

It is well known by experienced cultivators that more than ordinary pains must be taken in order to keep up throughout their season a regular supply of turnips of good quality. In dry seasons, and chiefly upon light, warm soils, this undertaking is often beset with some difficulties, and under these circumstances, unless he takes special care, the grower is almost certain to meet with failures that will cause blanks in his supply. This need not, however, happen so commonly as it is known to do, and, if proper cultural means are available, and good use is made of them, a good supply may be maintained.

TEMPLE SHOW—A BOLD ROCK GARDEN.
Tastefully arranged and planted by Messrs. Backhouse and Son.

In the first place, it is important that suitable varieties be selected for the special cultural methods, in order to be successful through the different seasons of the year. Notwithstanding that there is a fairly plentiful number of excellent varieties suitable to grow for early, mid-season, and late crops, it is not necessary to have any considerable number. In fact, three varieties in ordinary cases, are all that will be really required—i.e., one for early, one for general, and one for late supplies.

Crops under Glass.

With a view to secure nice young roots as early in the year as is practicable, the first crops should be grown under glass, but this need not be an expensive or very difficult affair, for ordinary frames answer admirably for the purpose. The difficulty about this matter does not usually arise from the cultural skill required to attain success, but more often, though they can be simply and easily supplied, from the lack of the necessary conveniences. A commencement, to provide dishes in May, should be made at about the middle of February by sowing Early Milan, which answers well for this mode of culture, while another valuable variety for the purpose is Early Long Forcing. Successional sowings may be made under glass at as frequent intervals as necessity and convenience permit.

The seed should be sown in fine soil, placed conveniently near to the glass, and timely attention need be paid to the thinning, watering, etc., of the plants. A leading point, however, in this kind of culture, is to attempt forcing only by gentle means; particularly is this so with reference to bottom heat, all that is required, or, indeed, can be safely employed in this way, being mild warmth, which may be best afforded by tree leaves lightly mixed with stable litter.

Early Outdoor Crops.

Sowing turnips very early outdoors is, at the best, a venturesome proceeding, but in favourable localities, when the weather permits and the soil is in suitable condition, a small sowing of Early Milan should be made by the middle of March, upon a south border in drills a foot or fifteen inches apart, the soil being worked fine. Small sowings of this variety should follow at frequent intervals, by which practice an early supply of young, fresh roots may be kept up; and should some of the plants bolt, as they are likely to do from very early sowings, no serious loss will take place.

Mid-season Crops.

For sowing from about the middle of April until the end of July, there is no variety so valuable as is a good selection of Snowball. This well-known and generally valued kind, both for exhibition and ordinary use, is of perfect shape, and excellent flavour, has a white flesh, and remains in good condition for a considerable time, and though it is best under ordinary circumstances to make small sowings of it often, rather than large ones less frequently, it is nevertheless advisable to make a comparatively large one early in May. The summer crops are invariably the most difficult to manage, especially during long spells of dry weather. Therefore, the land upon which they are grown should be well manured, and otherwise thoroughly cultivated, and if a partially shaded position is available so much the better. As a check to the "turnip fly," frequent dustings with soot will be found beneficial, and in dry seasons the surface soil between the rows of plants should be kept stirred, and efficient watering should be given, and infinite benefit results from mulching the crops after the plants attain convenient size, with manure from mushroom beds, or with flaky leaf-soil.

Late Crops.

Red Globe cannot be surpassed for late crops, while for summer use, as a companion to Snowball, it is equally valuable. It is excellent in flavour, solid, and keeps well, if properly stored in a cool place before it becomes damaged by frost. For late supplies it should be sown in August and September, and in mild winters valuable small fresh roots may be secured from sowings made even as late as early October. We depend upon it entirely for late use. Where yellow varieties are esteemed, Orange Jelly is very deserving of being freely sown for yielding late supplies of small, well-shaped roots that keep a long time in good condition.

T. Coomber.

The Hendre Gardens.

Gooseberries, Red and White Currants.—Pinch out the points of the young growths on these, and remove entirely a few of the weaker ones when found growing too thickly. The leading shoots should be left ~~a little~~ longer than the side growths, the latter being shortened to six inches, and the leaders to ten inches. The extreme points of these young shoots are very often at this season infested with aphis, but this pinching process will invariably clear the bushes from these pests.—Geo. Woodgate.

TEMPLE SHOW—A PRETTY ALPINE GARDEN.
Arranged by Messrs. W. Artindale and Son, and tastefully planted with alpine plants.

HOEING.

The experience of many years has convinced me that the hoe is one of the most indispensable implements in the garden, and that it is rarely used enough. This conviction was deepened when, during a very hot period of the summer, I went over some large gardens where about fifty gardeners are employed, and saw gangs of half a dozen or more engaged in hoeing, while the surface of the beds and borders, and all among the shrubs, of which there was literally a considerable acreage, looked like a seed bed. We have all seen plants make a spurt after they have been hoed, and sometimes even fancied that they have increased in size instantly, as they appear to do after two or three minutes' rain. No apology is necessary, therefore, for dealing briefly with this subject, and this I propose to do in its twofold aspect of conservation of moisture and aeration of soil.

The fact that wet-looking, beaten-down soil will, after hoeing appear dry in an hour or two in favourable weather, leads some people to think that hoeing makes the soil dry, but that is quite a delusion. When soil lies firm on the surface moisture rises from below by capillary attraction, and as fast as it is evaporated, a fresh lot comes up to take its place, and thus the surface continues to look damp. When the surface is loosened, the capillary tubes are broken up, and the spaces between the particles of soil are so large that the capillary power is much reduced, and therefore, when the soil particles become dry they remain so. Hence, hoeing lessens the rate at which the soil parts with its moisture, the loose surface acting as a mulch.

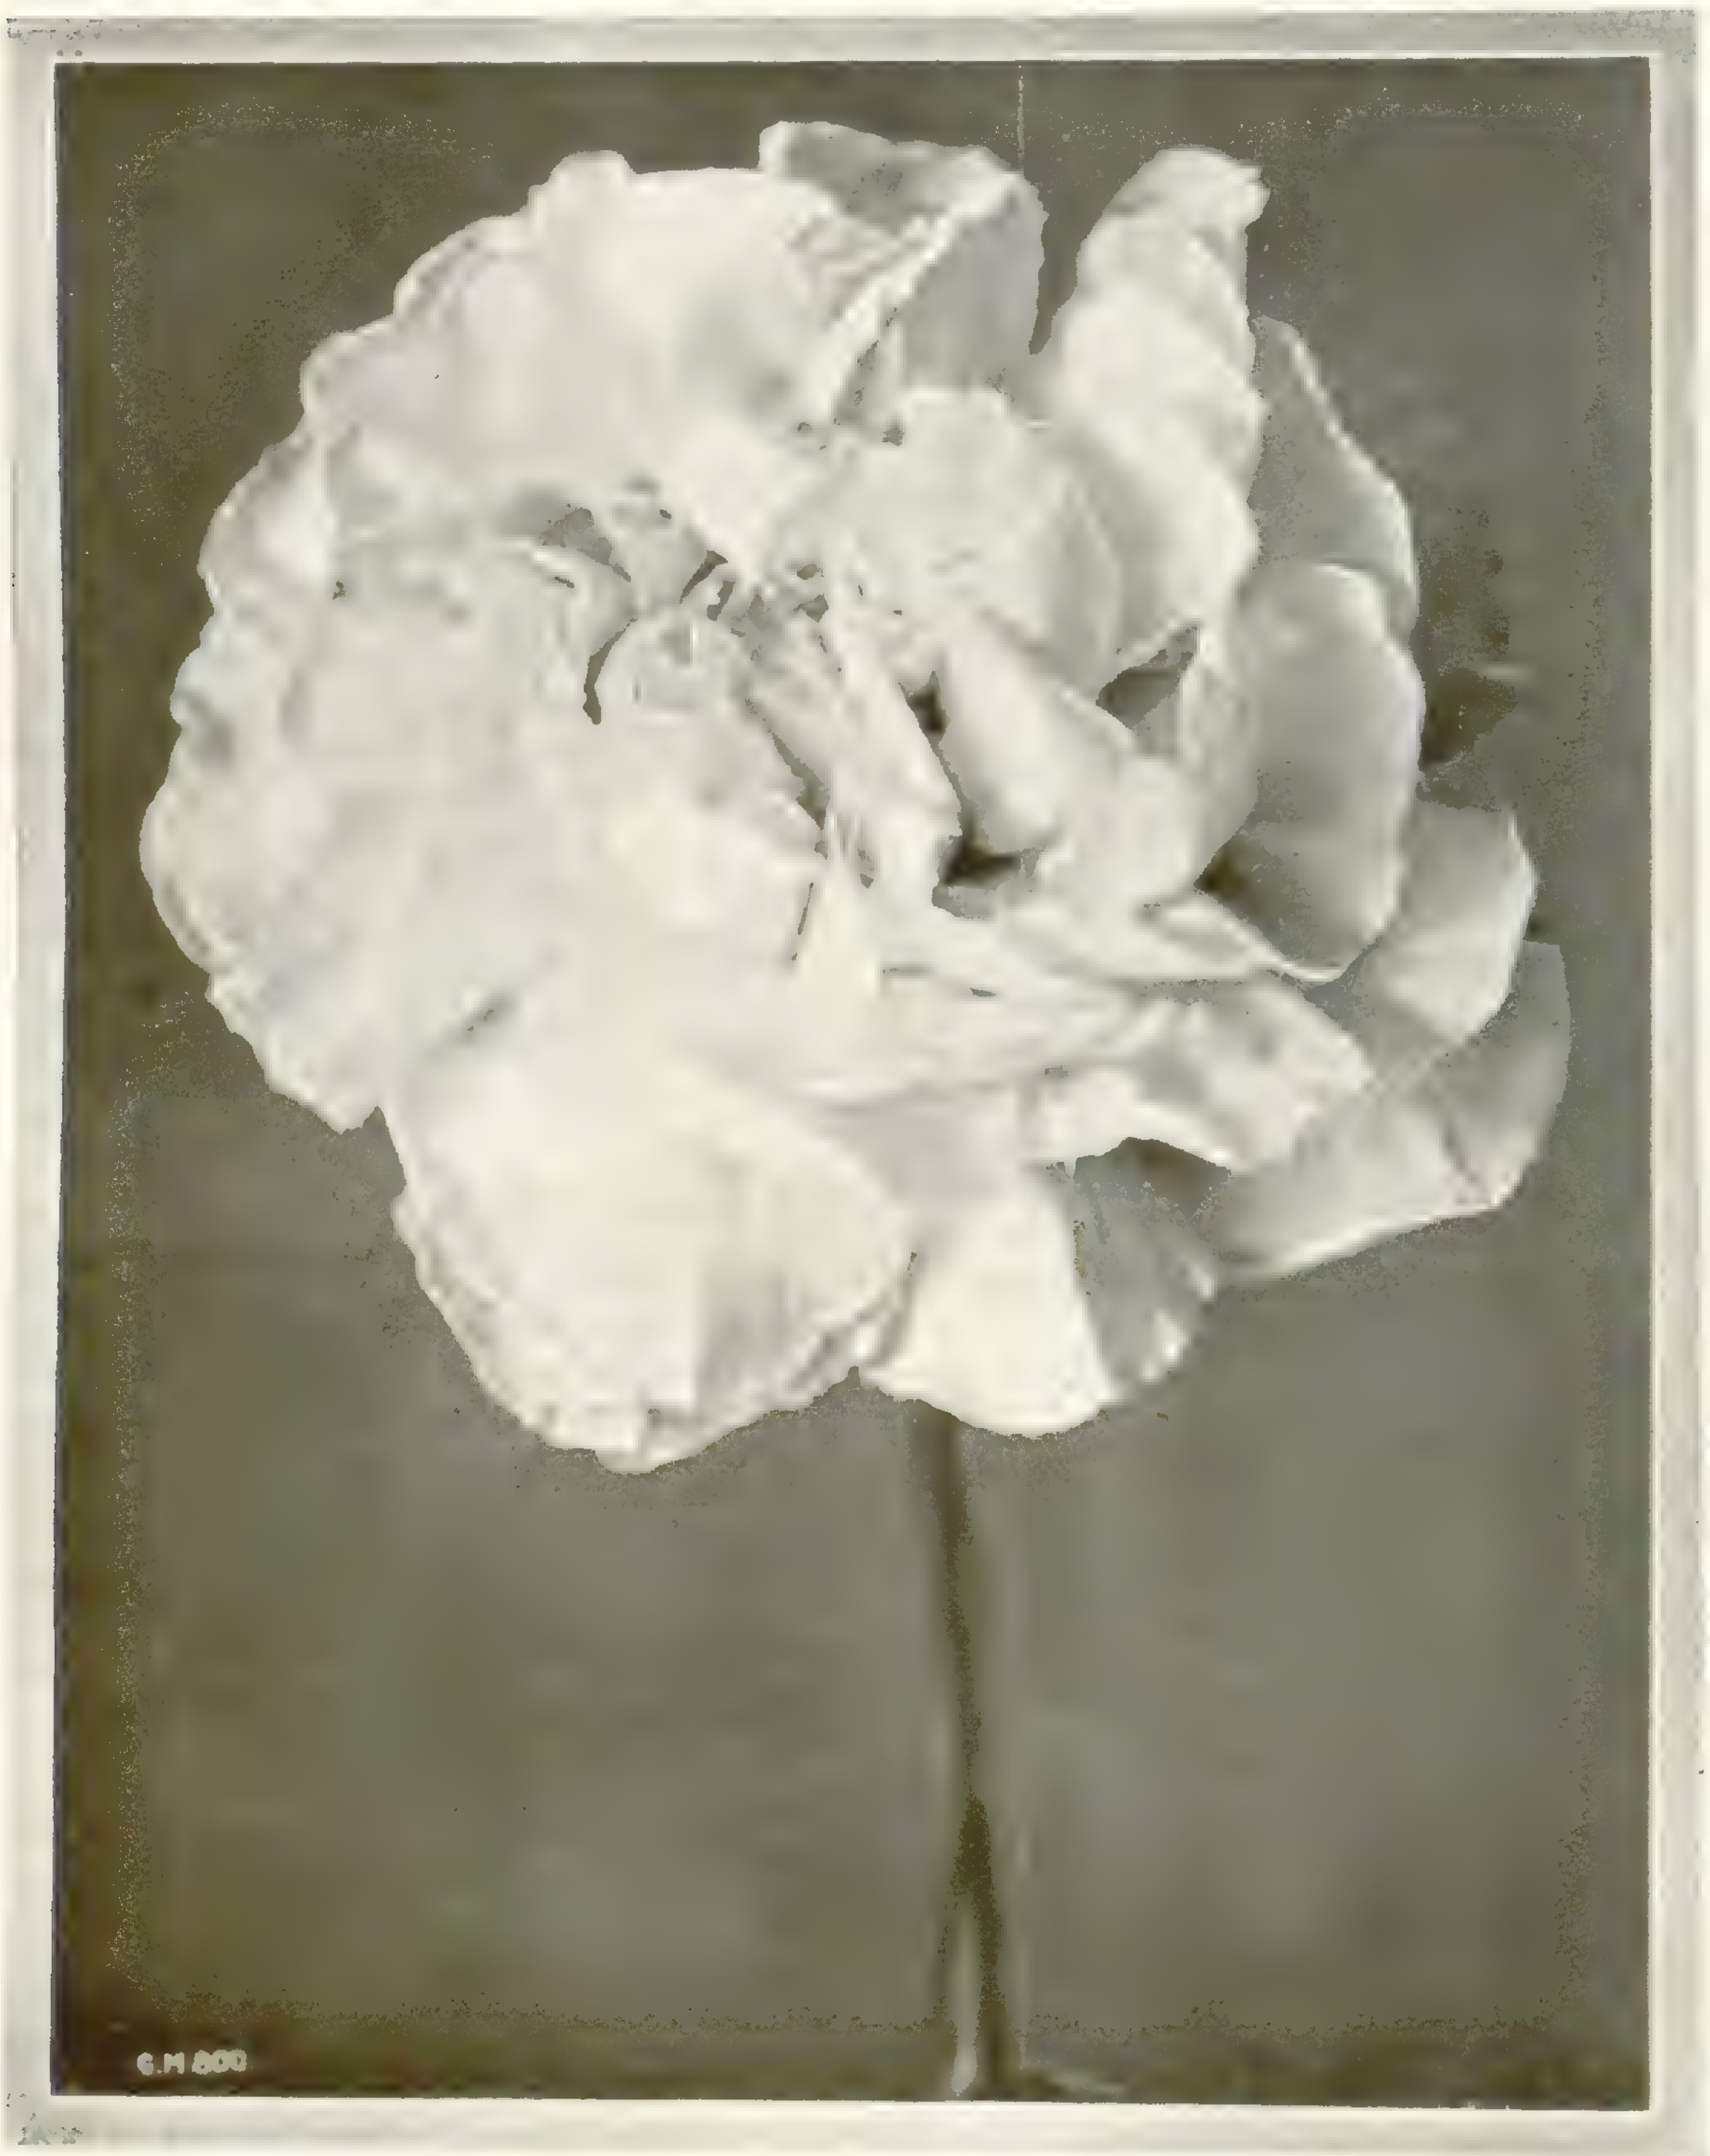
Therefore when we know that certain soil will become dry all too quickly in the spring, as in fruit tree plantations, permanent beds and borders, etc., the surface should be hoed as soon as it is dry enough in the spring, and all through the summer whenever any rain beats it down. But when we want any soil to become dry for planting or sowing, the stirring of the surface should then be deferred till it is becoming dry enough below. One often sees people with small town gardens, perpetually watering with a rose in the summer, so that the whole of the beds and borders are in a caked condition, the result being that much of the water runs off or only sinks in a very little way, and the hot sun dries it up; and not only that, but the close condition of the surface favours the rise of moisture from below as long as there is any left, and thus it is quite possible that, unless the watering is repeated very frequently, the soil a foot down may be drier than if no watering had been done, but a little timely hoeing done instead.

Then, as regards the aeration of the soil. If the growing tips of the roots were examined under a high magnifying power, they would be found to consist of an aggregation of delicate cells of protoplasm, not very unlike those in some parts of the human body. Continued observation under favourable conditions would show that these cells were rapidly growing and multiplying by a process of division, and thus fresh living substance was constantly being formed. These cells, being alive, need air to obtain that supply of oxygen without which they are unable to carry on their vital processes, like the cells in our own bodies, and if air could be excluded altogether they would die. Hence, in waterlogged soil plants make but little root because the interstices of the soil which should be filled with air are filled with stagnant water instead, thus preventing fresh air getting to the roots. Similarly, when the soil forms a cake on the surface, especially if this cake is of an impervious nature, as in a clay soil, but little air can reach the roots, except such as is forced in by atmospheric pressure, as the water below drains away or is lost by evaporation at the surface. The result is that the roots suffer from want of air, and the living cells not being able to grow and multiply freely, the plant grows but little, like individuals in similarly unhygienic conditions. Hence the rapid increase of growth which is often observed to follow the breaking up of such a crust with a hoe, and the thin growth, which results from incessant watering.

But this is not the only benefit derived from the aeration of the soil, for the latter is full of living germs, some of which are breaking down the complex organic substances in the soil—unexpended manure, and the decaying organic matter generally which is included in the term humus—into simpler bodies, which can be used by the plant, while others are converting one of these products of decomposition—ammonia—into the only form—nitrate—in which the majority of plants are able to absorb that nitrogen which is such an essential of all growth. Without free admission of air the soil becomes sour, and then some of the most important classes of germs cannot work, the manufacture of a valuable supply of plant foods being thus stopped or greatly hindered. Hence the frequently stirring of the surface soil adds to its fertility, and, by the breaking up or consumption of the humus, causes the soil to be very tender, so that the surface is in a friable condition.

Thus hoeing improves the mechanical condition of the soil, conserves its moisture in dry weather, is indispensable to the preparation of valuable plant food in the soil, and assists the entry of oxygen so necessary to healthy root formation.

Alger Petts.



TEMPLE SHOW—CARNATION MRS. TOWNSEND.
An effective yellow-flowered border variety. Shown by Messrs. Jarman and Co.

Carnations.—Malmaison carnations will now be well forward in bud, and should receive every attention in respect to water, and frequent applications of liquid manure will greatly help them. The winter blooming varieties, if still indoors, will also be producing strong flower stems, and the same treatment will suit them admirably. Any of the plants that are producing good shoots, but not showing bloom, would make fine dot plants in the borders during the summer, or a bed of them makes a very fine display indeed. The young plants are now in vigorous growth, and may have the points of the shoots taken out to encourage a more bushy habit. If nicely rooted they should be shifted into 48's, using a compost similar to that advised in a previous calender; the plants may be placed in a quite cold frame, where the lights should be entirely removed as soon as the roots begin to run freely in the new soil. Frequent syringings with well-diluted soot water will not only keep down green-fly and red spider, but will keep the plants generally in a healthy condition.—T. Stevenson, Woburn Place Gardens.

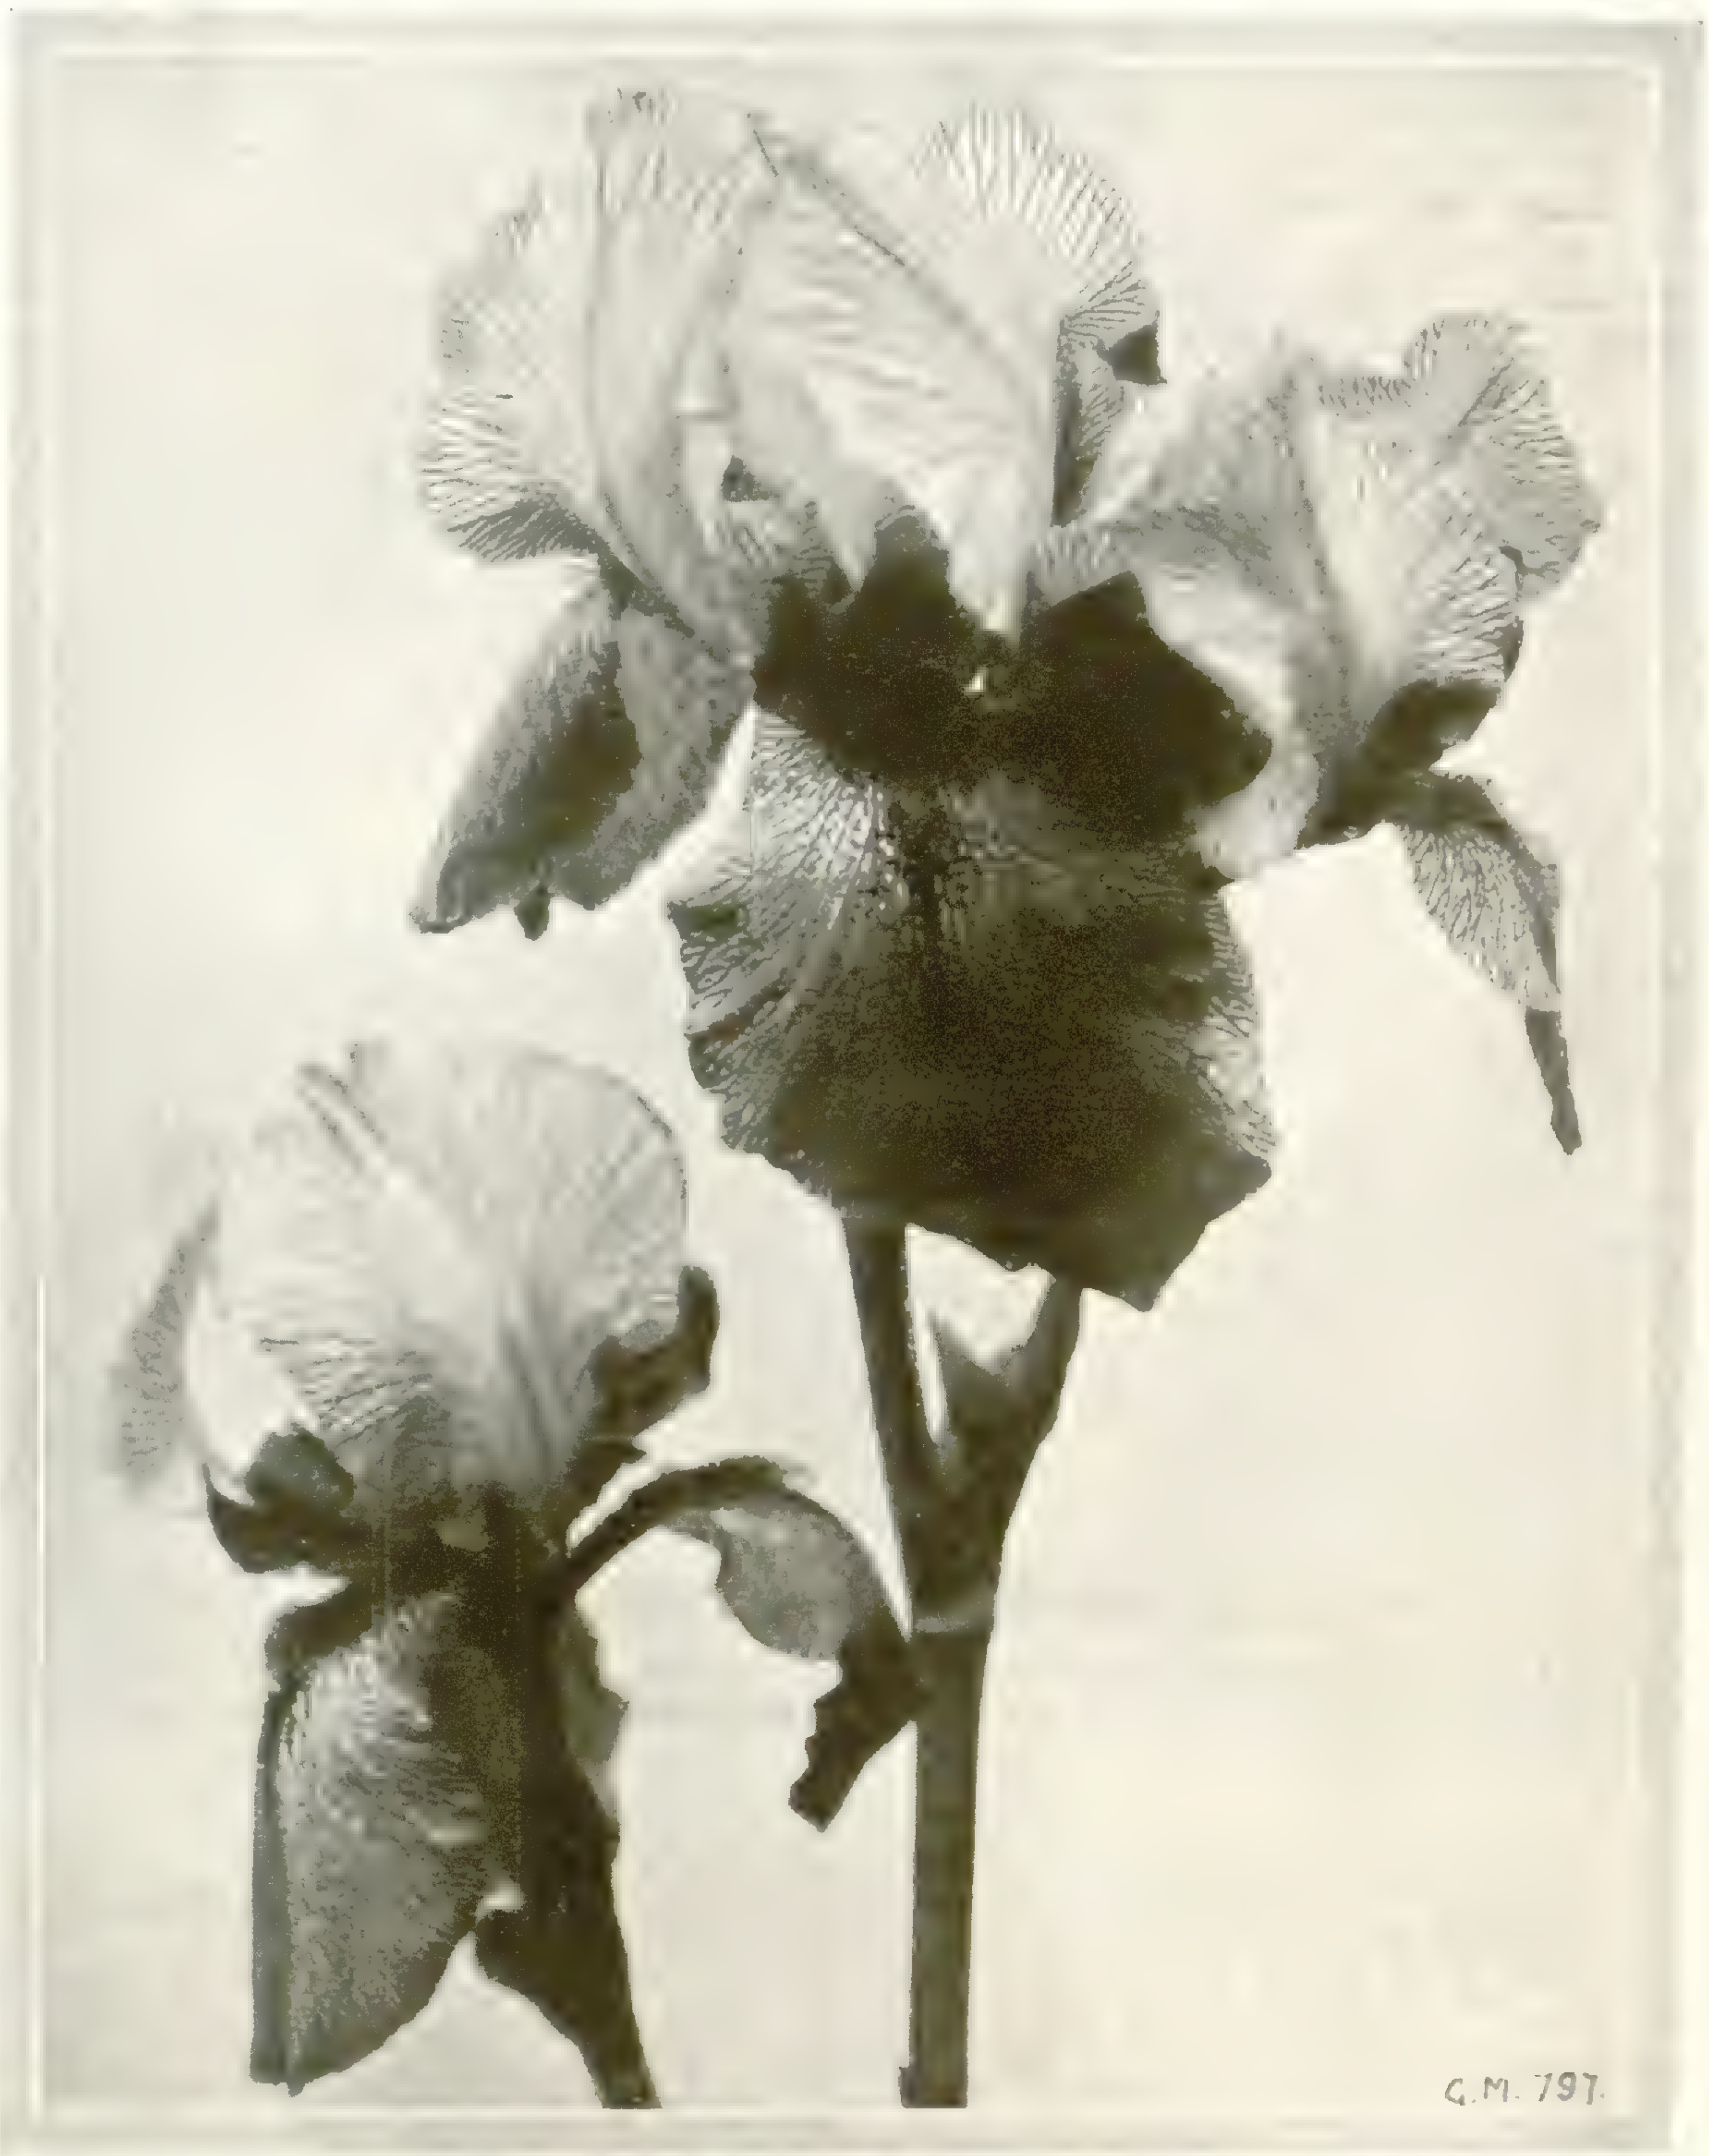
THE TIME OF INSECTS.

We have arrived once more at the season of activity in woodland, orchard, and garden; at the moment of writing fruit trees everywhere are in full growth, and many of them have been beautiful with blossom. The outlook is promising, and unless something comes along to upset calculations, there is no apparent reason why crops should not be bountiful. Just so, but it is in May and June that fruit crops run the gauntlet, and if Jack Frost does not trouble us with his unwelcome presence, we are reminded that at the time when fruit trees are commencing to swell up their fruits, insect pests of different kinds are satisfying their voracious appetites at the expense of the fruit grower. The danger of frost is bad enough, but the risk ends with the exit of May, and we take hope and comfort in the fact that it is not every season that we suffer through this trouble. Insect pests, on the other hand, are a hardy annual at this time of the year; they always appear in numbers great or small, and do more or less damage, and very often when we get frost as well, climatic conditions are often blamed for damage done by living pests.

Except amongst gardeners and commercial fruit growers who have made a study of insect pests, the notions held about them amongst country folk are very hazy. Only in a few cases are the habits and life histories of common pests studied at all, and if teachers in schools are on the look out for material for Nature study, they have a splendid field here, because if we are to induce people to take any real interest in these matters, we must begin with the boys at the village school. The older folk make no attempt at discrimination at all, but include insect pests of every description under the comprehensive heading of "blight," and many of them have very vague ideas as to the origin of insect foes. "I doubt we shall have no fruit, the trees are dreadfully blighty," is an expression not infrequently heard in May and June, and there the matter ends, for the rank and file of growers do not concern themselves as to what particular insects are doing the damage, nor take any steps to protect their crops.

There is no mistake, however, that blight, to use the common expression, is a terrible evil at this time of the year, and one realises this when we see trees breaking into growth and beautiful with blossom one day, and then a short time after filthy with vermin, crippled and stunted through the ravages of the pests, and, what is worst of all, fruitless or nearly so. According to an old saying, familiarity breeds contempt, and this apparently applies to fruit pests as it does to other things, for people in the country who are in touch with the injurious insect life about them, and suffer through its ravages, take no trouble, except in solitary instances, to make themselves acquainted with the forms and habits of their enemies. While this apathy remains, blight will continue to wage its deadly warfare, crops will be lost, and returns will be affected, because if any battle with insect pests is to be really effective it must be general all along the line, not a case of a solitary individual here and there fighting, and the rest of the community harbouring the pests that the few valiant ones are trying to eradicate.

Full credit is due to those who have done and are doing their best to supply fruit growers with the arms and ammunition for fighting blight. Apparatuses for spraying have been improved considerably in recent years, and we have insecticides galore, but in spite of this spraying is yet in its infancy. On the grounds of expense, and through lack of faith in its effects, coupled with a certain amount of native conservatism, there are many who will not spray at all, while others are disappointed, inasumch as they have sprayed in winter, and made their trees clean and fresh looking, but this has proved ineffectual of preventing damage from pests in the spring and summer. Of course, the scientist can explain the reason, but the grower has spent his money, got tired of spraying, and, refusing to listen to explanations, he gives it up. This is a pity, for fruit growers should have patience with the men who are trying to help them, and remember that they have to learn as they go along.



TEMPLE SHOW—IRIS SIR DIGHTON PROBYN.

A charming variety with large handsome flowers, the colour rich purple, veined with blue. Shown by Mr. Amos Perry. A.M., R.H.S., May 25. (See New Plants.)

We have proceeded far enough to know, however, that one spraying is not enough. By winter spraying we may clean trees, and remove a good many of the natural harbours of insect pests, but this is not enough to prevent attacks in the spring and early summer. Caterpillars, suckers, midges, and aphis make their appearance from secret lurking places, and a second spraying becomes essential. The grower asks what he shall use, and when half a dozen people advise as many different washes, no wonder he gets a bit confused, like the sick patient when doctors disagree. It is a knotty question, this subject of spraying, when one considers the expense, the doubtful results, the possibilities of a glutted market, and other points; but still there are signs sufficient to prove that spraying has come to stay.

The time of insects is a season of anxiety to everyone who grows fruit, and every credit is due to growers who fight the pests to the utmost in their power, and if the means they use do not prove to be as successful as they would wish, do not throw up the sponge at once and vent their rage on the scientist who recommended the insecticide. It is by perseverance alone that problems are mastered, and the one under notice is not an exception. One can have a certain amount of sympathy with the fruit grower who sits on the fence, is ready to take up the fight, but is waiting till the days of experiment are over, and absolutely effective means of eradicating pests have been introduced. The men who one can have little patience with are the apathetic ones, the don't-care class of individuals, who have no faith in anything nor anybody, and never take any steps to eradicate common foes either in their own interest or that of their neighbours. These are the men who this season, as in past years, will do nothing themselves, but look with critical gaze on the well-meaning efforts of their neighbours, and rejoice if the methods the latter adopt do not prove a complete success.

H.

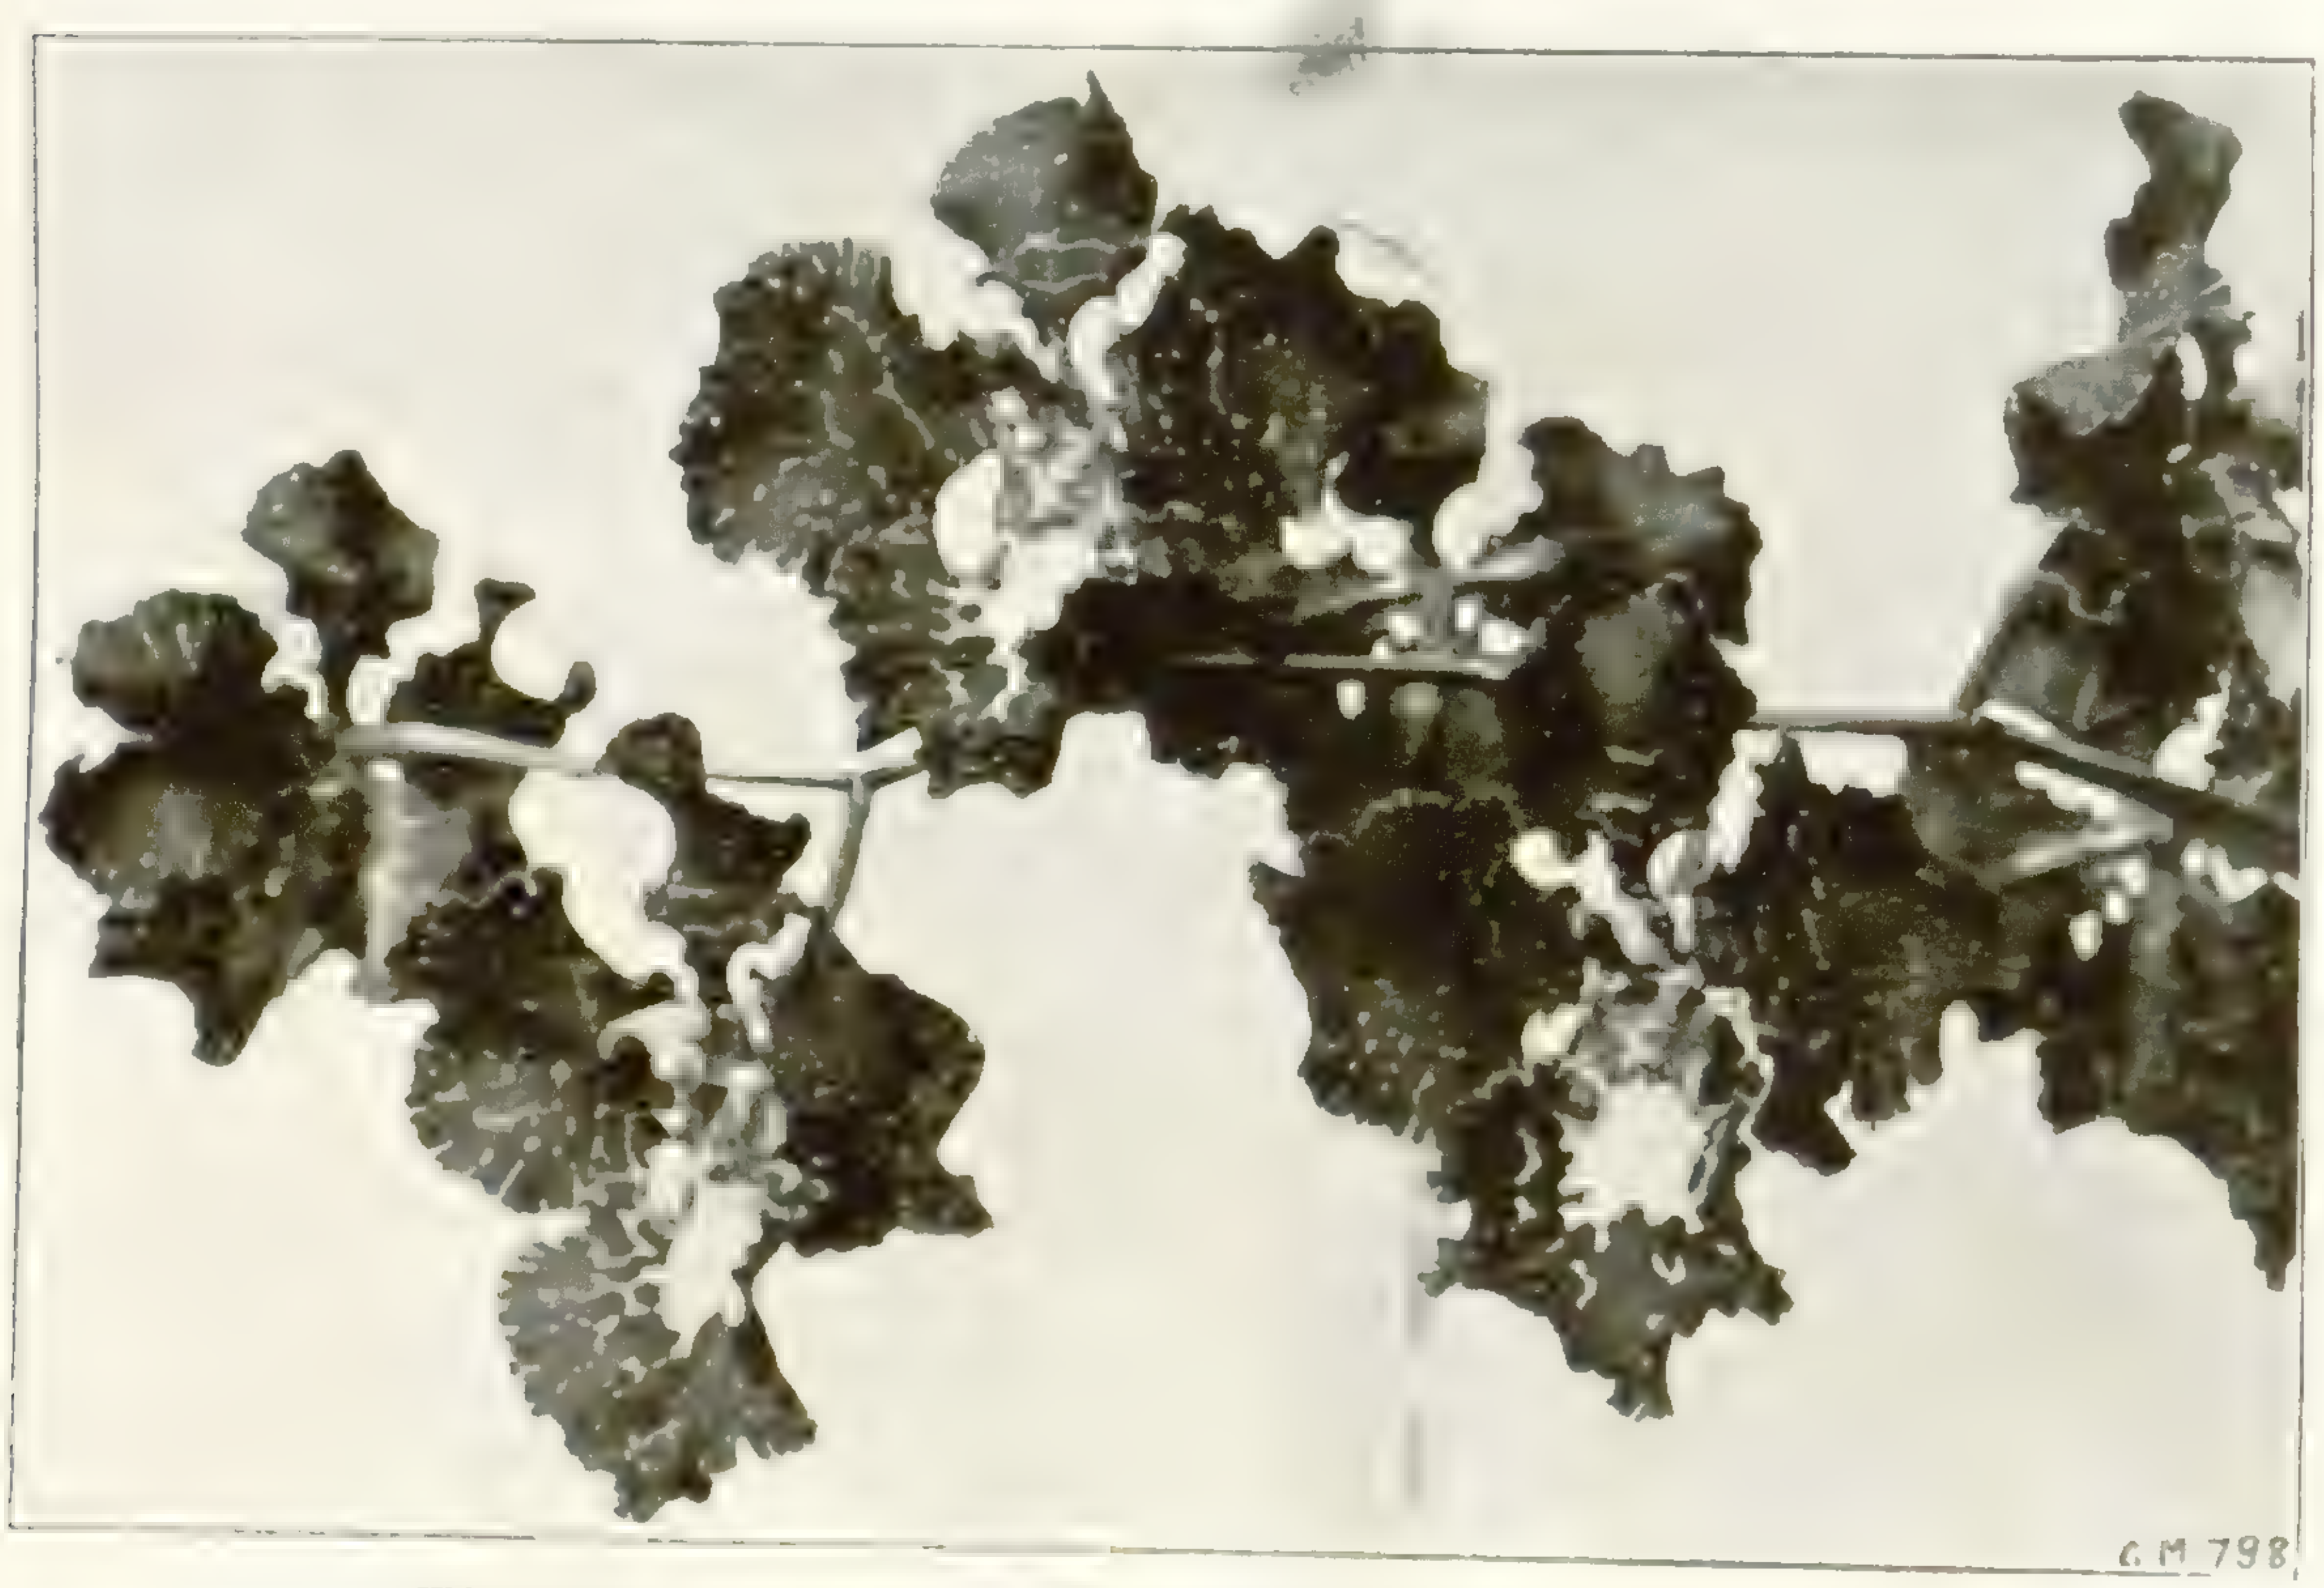
IN THE ROSE GARDEN.

Unable to be at the Temple Show myself this year, I yet had many messages sent me about the condition of roses and prospects for the fast approaching season. Very general are the complaints about the late frosts early in May and prevalence of keen, searching winds. From the reports we must congratulate ourselves upon the way our own plants have come through. Several growers complain that their promising maiden growths of eighteen inches to two feet are cut down to the base. This is evidently worse on the east coasts than anywhere in the south.

Just before pruning our roses—more particularly those grown as standards—we had some very promising heads left, but the severe frost completely killed them; not only the rose growth, but briar stems as well. This was our chief loss. Fortunately, our maiden buds were very backward, being fully exposed upon high ground, and so they were scarcely pushing up during the trying time of early and mid-May. The rose maggot is attacking work, weeds or no weeds. There is no better time than the present to put on artificial manure, and if you can apply this during showery weather, and hoe as soon as possible, I think the effects are much better. At present we are drawing up soil to our maiden dwarfs very much after the same style as if earthing up potatoes.

I notice a great preponderance of dormant buds that were worked upon the standard briars last summer. Many of these have not even started, and yet they appear sound. But if we look into them closely a large number will be found injured by frost, especially where the small piece of rose bark is fitted upon the stock. This is in no way the fault of the budder, because, if clumsily inserted, the bark would have turned brown and the bud be dead by the autumn.

As the season advances there will be need of some support to young growth upon maiden standards. A stake sufficiently long to go into the ground and secure both briar stem and rose growth is preferable, but where there is a large number, many tie a thin hazel stick to the briar stem and secure the rose to the upper portion of the stick.



TEMPLE SHOW ONCIDIUM CHARLESWORTHI.

A distinct and handsome species; the flowers of large size, the colour bright brown with golden markings. Shown by Messrs. Charlesworth and Co. F.C.C., R.H.S., May 25. (See New Plants.)

Roses on walls and pergolas, especially the former, are likely to be much infested with insects, and I am convinced we do not use the syringe freely enough. Even water alone is a grand cleanser. No insects approve of it, but the plant does. A little insecticide is very helpful, but a very free use of water itself can be strongly recommended. On walls and corners of houses the plants are exposed to greater variations of temperature, and those in the warmest nooks will almost sure to be covered with greenfly, etc. With the sun very strong, the situation dry, and the great absorption of moisture by the walls, we need supply more root moisture than is generally the case, and now that growth is vigorous a liberal application of liquid manure will be beneficial. Here again I would advise double the amount of plain water mixed with the same quantity of liquid manure than is usually the rule.

Where a few rose blooms of extra size and quality are wanted, disbudding will need attention as soon as you can pick out the side buds.

A. Piper.

growth very much, and needs constant hand-picking. Dealt with thoroughly now there is little further bother with this pest, while any neglect means loss of bloom almost to the extinction of the first crop, especially when the growths are retarded by uncongenial weather.

We are busy among standards now, and no time should be lost in examining the stems of newly-planted briars and reducing the side shoots to two or three of the most promising that are nearest to the height we want the future rose tree to be. This greatly facilitates budding, and strengthens the required shoulders. Some of our most forward will be ready to bud by the end of June, and all that were left over from last year are ready now as soon as one can obtain the buds. Here we find a great advantage with buds grown under glass, our pot plants producing ripe, sound buds beneath their last crop of flowers, while those from the open are too young and soft early in the season.

We have had a very dry and trying time, but as I write there are welcome showers, although very cold for the date. Constant hoeing has kept the beds clear from weeds, but I would still keep this implement at

THE LOCUSTS OR FALSE ACACIAS.

Amongst trees suitable for ornamental planting, the Robinias or False Acacias have several recommendations, for, in addition to the foliage being of a dainty and pleasing character, the flowers are showy and freely produced, and the larger-growing species, when mature, are often of very picturesque appearance. The number of species is not large, but there are a great many varieties, some of which are very distinct either in habit, foliage, or flowers.

The genus is a North American one, the several hardy species being found in the Southern or Eastern United States. The first species to be introduced into Europe was the Common Locust, Robinia pseudacacia, and, according to Mr. G. B. Emerson in "Trees and Shrubs of Massachusetts," it was introduced into France either in 1601 or 1635, the exact date not being known. The difference in the dates is accounted for by the fact of Linnæus founding the genus Robinia in honour of the introducer, one of the French horticulturists, Jean Robin, or his son Vespasian, but which there appears to be some doubt. Soon after its introduction into France, it appears to have been received in England, where it has been in cultivation until the present day.

Cultivation.

The Robinias are not difficult trees to deal with, for they thrive alike in light and heavy soil, providing it is not naturally wet. For very light soil they are well suited, and fine specimens are often found growing in little else than sand. In moderately good soil growth is rapid, and it is no uncommon thing for young trees of the stronger-growing sorts to add six feet or more to their height annually. As they advance in age, however, growth in height is less rapid, whilst spread of head is increased. Attention to pruning is necessary during early life, for, if the tree kinds are allowed to form a number of rival [illegible] they are less able to withstand the strain [illegible] rough winds than those with single trunks and evenly balanced heads of branches. Propagation may be effected by seeds in the case of most of the species, and in other instances by root cuttings, or by grafting on stocks of R. pseudacacia. The kinds that assume the stature of trees form excellent lawn specimens, whilst they are also admissible for groups in parks, etc. The dwarf growers are also serviceable for lawns, and may also be included in shrubbery borders.

Economic Properties.

In some countries the leaves and young branches are used to some extent for fodder for cattle, but the timber of the larger-growing species is the principal asset. The best Robinia timber has been likened to the best oak for strength, durability, and elasticity, and it is used extensively for various purposes in the United States. According to Loudon, in his "Arboretum et Fruticetum Britannicum," the Common Locust was boomed largely for planting for timber in this country during the early part of the last century. The reason for this was that William Cobbett visited the United States during 1817 and the two following years, and was convinced that "nothing in the timber way could be so great a benefit as the general cultivation of this tree." He, it is stated, on his return from America, set up as a nurseryman, and grew this tree largely under the name of Locust. People were so [illegible] with the tree, and thought that [illegible] only held the correct plant, that he was unable to produce it fast enough to supply orders, whilst many other nurserymen had large stocks of the same tree which they were unable to sell. It is, however, as an ornamental tree rather than a timber tree that it is now planted, though it would doubtless be found of value on certain kinds of soil. W. Dallimore.

(To be continued.)

SPRING FLOWERS AT BOURNEMOUTH.

In an exquisite setting of trees, shrubs, and verdant lawns, the beds of spring-flowering plants look exceedingly gay at the present time in Bournemouth. In fact, I have never seen them look so well before, and it has been my privilege to inspect the gardens nearly every year during the past quarter of a century. At the first casual glance the visitor might be excused for thinking that the predominance of yellow and primrose colours was not pleasing. But the very boldness of the bedding-out scheme commands admiration. Mr. J. B. Stevenson, the able superintendent of the very extensive public parks and gardens of Bournemouth, has not hesitated to produce bold effects, and never failed. There is ample scope for them. At the present time yellow colours prevail. Later, other colours will show up in masses, so that the changes, right up to the end of the spring bedding season, are very agreeable and most attractive.

The majority of the beds are formed on both sides of a broad central and beautifully curving path which leads through the valley gardens from the heart of the town to the pier. These beds are large ones, and mostly planted to form pairs. The following are a few of the arrangements: Aubrietias as a groundwork, yellow tulips as dot plants, and double white daisies—a broad band of them—as an edging. Scarlet tulips and polyanthuses mixed, a very pleasing combination. Double daisies as groundwork with scarlet tulips, and an edging of aubrietias. Pansies as a groundwork, narcissi dot plants; white violas as an edging. A really grand pair of beds. Wallflowers, Narcissus poeticus dotted among them, and dwarf yellow wallflowers as an edging.

Anemones and narcissi were very effective in the borders. Violas as a groundwork with tulips were exquisite; as also were beds filled with pink and white tulips, and aubrietia forming the groundwork. A large fountain was enclosed in scroll-work formed of the following flowers: Wallflowers, dark red and pale yellow, tulips in clumps over a carpet of double white daisies; rose tulips and purple aubrietias; anemones, narcissi, and tulips over violas, all combined to fill this noble-looking border.

At the entrance to the gardens from the pier broad bands of polyanthuses bearing huge trusses of flowers encircled a plantation of firs and other kinds of trees under which narcissus were growing in groups in a quite natural state. Near by was another attraction, a plantation bounded by narcissi and three rows of hyacinths in red, white, and blue colours. Clumps of rhododendrons in full flower, plants in herbaceous borders, narcissi in the grass amidst palms, bamboos and shrubs, down to the edge of the clear stream which courses through the gardens to the sea, form a few of the present features of these delightful pleasure grounds.

Geo. Garner.

Professor G. L. Goodale, who has during the past thirty years been Fisher Professor of Natural History and director of the botanic garden at Harvard, will retire in September next, when he will have completed his seventieth year. Professor Goodale has been associated with the botanical department of the Harvard University since 1872.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

SUMMER - FLOWERING CYPRIPEDIUMS.—There are several species and hybrids that flower in summer and are in every way suitable for extensive cultivation in gardens where the facilities of a stove or an intermediate house is provided. They are also, in most cases, plentiful, and, therefore, procurable for a modest outlay. Some of these are among the oldest orchids in cultivation, but are none the less beautiful, useful, and deserving of recognition. C. barbatum, and its varied forms are really unsurpassed when they are grown into large specimens, the free-flowering characteristics rendering them suitable for exhibition purposes, while the durability of the flowers leaves nothing to be desired when used as cut blooms for decorative purposes. The older hybrids that have had C. barbatum as one of their parents, such as C. Harrisianum, S. selligerum, C. Swanianum, C. W. Lloyd, and those also which have resulted from the intercrossing with the winter-flowering kinds, are, in most instances, exceedingly useful for supplying cut flower.

CYPRIPEDIUM LAWRENCEANUM is a noble form, which can be grown under the same conditions as the abovementioned, and possesses equally free-flowering characteristics. It does not require much pot room, and is best treated with annual repotting. In dealing with imported plants of C. Lawrenceanum it will be found that they have in their native habitat been producing a succession of growth annually, and they rarely attempt to make side or back breaks, yet, if these back growths are carefully examined, it will be seen that they possess dormant buds, capable of producing new growths. The same remarks will apply to plants that have been in cultivation for a number of years. These dormant buds rarely start into growth unless something detrimentally affects the leading growth or the rhizome which connects the growths becomes damaged or severed. It is well, therefore, at the annual repotting, to cut the rhizome asunder, leaving only the growth that has recently flowered, and possessing a new growth. These back growths should all be put into small pots, and it will be found that where new growths are produced they quickly make roots, when they should be given more root room.

C. CURTISI I consider to be the most easily cultivated of the whole section of summer-flowering cypripediums, but for preference I would recommend that it should be grown in a stove temperature, or where the temperature of the house is maintained at 60 degrees in winter. It will grow under cooler conditions, but I have not found it so vigorous. It is very free-flowering, and the blooms last for several weeks in perfection. This species blooms rather later than the foregoing, and is most serviceable for the late summer exhibitions. The hybrids from this species are most desirable, and possess the vigorous constitution of this parent.

C. CALLOSUM and the albino C. c. Sanderæ are now plentifully distributed, and they may be grown in an intermediate house under the same conditions as C. Lawrenceanum. The hybrids also of this species are worthy of every consideration. The best time to repot this section is when the new roots make their appearance.—H. J. Chapman, Oakwood Gardens.

TEMPLE SHOW—ROSE AMERICAN PILLAR.

A lovely single variety of robust growth, and producing its large rose pink flowers in huge trusses. Shown by Messrs. H. Cannell and Sons. A.M., R.H.S., May 25. (See New Plants.)

CONSERVATORY AND GREENHOUSE.

CHRYSANTHEMUMS.—During the present month there will be a good deal of work in connection with chrysanthemums, and where potting has not already been done it must be taken in hand at once. The plants are very liable to suffer if left too long in the 32-sized pots, where good blooms are required, whether for exhibition or any other purpose. An early shift into the pots in which they are to bloom is one of the essential points. Everyone knows that a fairly rich turfy loam is the best for chrysanthemums, to which has been added leaf-soil, wood ashes, bonemeal, soot, and sand. When mixing the materials do not be afraid to add plenty of material for the lightening of the soil, particularly if the loam is at all heavy. It is much easier to give water than to get the plants dry again after a very wet spell if the soil is close in texture. For large blooms I prefer to use No. 12 pots, and potting should be done very firmly, leaving a space of at least two inches for top-dressing during the season and for watering. After potting it is advisable to stand them quite pot to pot for a few days, for the convenience of frequent syringings, also after being well watered in the second day after potting, the plants will require very little more water until they commence rooting, when they may be put further apart in their permanent quarters, and staked.

DECORATIVE VARIETIES should also receive attention as soon as the others have been dealt with, and 9in. or 16-size pots will be found large enough for all varieties, though some of the singles, such as Ladysmith and Miss Mary Anderson, of the early-flowering varieties will be found very useful if kept in a size smaller pot, viz., 24's. If small plants are required, say, in 48's, the present is a good time to propagate these, and they will be found to make quite nice plants if kept moving. All the single and decorative varieties I grow quite naturally, and as hard as possible, never pinching them at any time. I find they make quite as good, or better shaped plants, and give as good flowers as when stopped two or three times during the growing season.

FERNS that were potted up early in the spring will now be growing very freely, and in the case of adiantums will require attention to see that none of the fronds are turning yellow by becoming too thick in the centre. This often is the case where they are grown under vines or elsewhere, and heavily shaded. Liquid manure may be used to stimulate growth. If good specimen plants are wanted of pteris, nephrolepis, aspleniums, gymnogrammas, microlepis, etc., they should be potted on before the roots become at all crowded round the sides of the pots, and many of them will make very fine plants within a year. Should the fernery, however, be unduly crowded some of the larger specimens may be placed here and there on pots on the vine borders, where they will grow very freely in the partial shade.

CARNATIONS.—The Malmaisons will now be making a good display, and to keep the blooms fresh for as long a time as possible it will be advisable to shade pretty heavily during the heat of the day, or, better still, remove to a lean-to house having a north aspect. It is not, however, always convenient to remove them. It is also wise to adopt some means for keeping the bees from the flowers, as they collapse as soon as fertilised. Border varieties that are growing in pots should be freely syringed, and liquid manure given them as they produce their flower stems. They may, of course, be brought in to fill up the house as the Malmaisons go out of bloom.

BEGONIAS.—Seedlings that are intended to be grown on out of doors to make tubers for next year should now be ready for planting out. The bed should be carefully prepared for them, adding some leaf-soil and old potting mould to the ordinary garden soil. They should be arranged about one foot apart each way, and about five rows in a bed. If they have been carefully hardened off they will not require shading, but plenty of water right through the season is essential, and this should be given towards evening, when the sun has somewhat lost its strength.

HERBACEOUS CALCEOLARIAS. — Seed of these should now be sown, using a nice light compost. The pots or pans should be filled and watered thoroughly some time previous to sowing, as often the seed is washed about when the watering is done afterwards. After the water has drained away sow the seed thinly, and give a slight sprinkling of sand, but not sufficient to entirely cover the seed. Place in a cold frame or house where sun will not shine upon the surface. The soil will not require watering till after the seed germinates. — Thomas Stevenson, Woburn Place Gardens, Addlestone.

THE FLOWER GARDEN.

THE ROSE GARDEN.—Many of the more tender roses suffered severely during the past winter, but where hard pruning has been done the growths are coming away strong, and the promise is generally good. The plants should be carefully examined, and every trace of maggot removed as far as possible. Frequent syringings should be given to the young growths, using a reliable insecticide both to destroy and prevent the attacks of aphis. The roots should be kept well supplied both with water and liquid manure, and the beds frequently hoed. Remove all stock suckers, and on light, drying soils give a good mulch of half decayed manure.

BORDER CARNATIONS.—These will require staking, and the surface soil should be constantly moved with the Dutch hoe. To ensure good flowers disbudding should be resorted to, and spent mushroom-bed manure should be placed between the rows to a depth of about two inches. Give plenty of water during hot, dry weather.

HERBACEOUS BORDERS. — The chief work in connection with this department will consist of staking and tying. This requires to be done with some care and forethought, or the pleasing effect of many kinds of plants will be quite marred. Endeavour as far as possible to allow each plant to attain its natural habit. The most hideous form of supporting plants is to bunch the stems tightly together to one stake. Many of the dwarfer kinds and varieties may be made secure with short brushy sticks placed about and around them, and the tall, stronger-growing subjects should receive several medium-sized stakes in preference to one or two stouter ones. Many of the moisture-loving plants will require to be kept well supplied with water, and the quality of the flowers will be much improved if liquid manure is given. Take care the stronger-growing kinds do not overcrowd and seriously injure some of the more fragile and beautiful ones. The borders should be kept thoroughly clear of weeds, and the surface frequently stirred with the Dutch hoe.

SUMMER BEDDING. — Complete the planting of the more tender subjects with as little delay as possible. Though the season is somewhat a late one nothing would have been gained by getting the more tender kinds out too early.

WALKS AND DRIVES.—Well-kept walks and drives are not only a pleasure to walk on, but add very considerably to the appearance of gardens and grounds. Every opportunity after rain should be taken to have these thoroughly rolled. Edges should be neatly trimmed and all rubbish cleanly swept from them. See that the catch pits are cleaned out after heavy rain. Since the introduction of the various kinds of weed-killers the labour in keeping paths free from weeds has been much curtailed. Now is a capital time for making use of these, and the best time to apply them is after rain, when the gravel has become moderately dry again. The greatest care is necessary to keep the weed-killers and the utensils used in a place of safety.—E. Beckett, Aldenham House Gardens.

HARDY FRUITS.

FRUIT TREE SUPPORTS.—Young pyramidal trees should have a stake fixed in the centre, that the leading growth may be fastened to it and encouraged to grow straight. This stake will at the same time prevent the growth being broken off by rough winds. If it is wished to have perfectly trained trees, it will be necessary to fasten a light bamboo cane or hazel twig to each main branch, and secure the leading shoot to it. Cordons, whether single, double, or treble, that have not yet attained their full length, should have the extension growths supported as recommended for pyramids. Espaliers, until they are furnished with the upper tier of branches, should have a support for the leading upright growth, and, when this is well extended above the position for the next tier of horizontal branches, select a couple of young buds that are found in the proper position, and are pointing in the right direction, and stop the main shoot at the next bud immediately above these, this will cause the young buds to push. The top one must be trained upright, and the next two growths in opposite directions. Great care is necessary in fastening these young shoots to the trellis, as in this stage they are easily broken off.

FIGS.—Remove without delay all surplus growths, bearing in mind when performing this operation that the leaves attain a large size, and unless plenty of room is left between the young branches it will be impossible for the foliage and wood to become properly ripened. Tie in the young shoots left as soon as they are long enough, and take out the point of each when it has made six leaves. Trees that are growing in a restricted border require copious supplies of water during the summer, and a light dressing of some approved chemical manure should be sprinkled over the border previous to applying the water, as soon as the young fruits are seen.

VINES.—Train in the young canes that are required for extension or for filling up the places of worn-out rods. Tie [illegible] in sufficient of the young shoots as there is room for, and remove all others not required. As soon as the young bunch is discerned, take out the point of the growth a couple of leaves above the fruit. Spray the vines on fine days early in the afternoon and take care that the border is kept well supplied with moisture. Keep a sharp look-out for red spider, and on the first appearance well spray the foliage on three alternate evenings with an emulsion made by dissolving one ounce of liver of sulphur in a little warm water, and, when ready, pour into a vessel containing four gallons of soft water, boil half a pound of soft soap in water and add to the former, well stir the mixture, and it will then be ready for use.

SWEET CHERRIES ON WALLS.—Train in the leaders, also young growths that may be required to fill up vacant positions. [illegible] pinch back all laterals to within five or six leaves of their base. Make sure that the trees are perfectly free from insect pests, because after the fruit has commenced to colour no insecticide may be used, or the fruit will be spoilt. Keep the borders in good condition as to moisture, and on the first signs of colouring let the fruits be protected from birds by netting, fixed well away from the trees.—Geo. Woodgate, Rolleston Hall Gardens.

Viburnum Carlesi.—Little more than a year ago—that is to say, on April [illegible] 1908—an award of merit was given by the Royal Horticultural Society to Viburnum Carlesi, a very pretty flowering shrub from Corea. It proved in many gardens to be a very desirable shrub, and the opinion was expressed that it would before long receive the higher award of a first-class certificate. One has not had to wait long for this, as on May 4 a specimen from Sir Trevor Lawrence's garden was regarded as worthy of the honour. Those who keep their copies of the Gardeners' Magazine (and everyone should do so) may, by referring to the number of that journal for April 24 of last year, see a life-like illustration of a flowering spray of this most desirable member of the Viburnum family. Unlike that popular shrub, the Laurustinus (Viburnum Tinus), it is deciduous, and the leaves, which are more or less pubescent, are somewhat like those of the Wayfaring Tree (Viburnum lantana). The flowers of V. Carlesi, which are borne in terminal rounded clusters, suggest in general appearance some of the greenhouse [illegible]tias. They are reddish in the bud state, but when fully expanded are white, and of thick, wax-like texture. The pleasing fragrance is another notable feature of the flowers of this viburnum. It has proved to be quite hardy, and will doubtless in time become generally grown. At present it is fairly scarce and expensive, having only been distributed in the autumn of 1905.—W. [illegible]

NEW PLANTS, ETC.

◆

ONCIDIUM CHARLESWORTHI.

This is a large and beautiful species, belonging to the handsome section of oncidiums of which O. crispum may be taken as the type. The blooms are of large size, and excellent form, the segments so broad as to make up almost a round flower. The colouring is rich bright brown, through and around which run thin lines of golden-yellow, the combination making up a very handsome flower. This is a distinct and fine addition to the genus, and, if it is available in quantity, it is certain to prove popular. F.C.C., R.H.S., May 25. Messrs. Charlesworth and Co., Haywards Heath, Sussex.

ODONTOGLOSSUM MIRUM EMPEROR OF INDIA.

This is a very large-flowered hybrid, and not only are the blooms large, but they are of good form and great substance. The colouring is deep red with marginal lines and bars of rosy-blush. The lip is very bright red, and has an orange crest and rosy markings. It is a striking odontoglossum, and its colouring is very distinct and handsome. F.C.C., R.H.S., May 25. Mons. Chas. Vuylsteke, Loochristy, Ghent.

ODONTOGLOSSUM PRINCESS VICTORIA ALEXANDRA.

This was one of the great attractions at the Temple Show, and created a great deal of interest. The spikes carried three flowers of fair size, but these were of excellent form and remarkable colouring. The latter was intense red-brown, or chocolate-red, and every segment had a neat margin of rosy-blush that set off the deeper colour perfectly. The lip was of similar hue with the addition of a deep yellow crest. It was a striking novelty. F.C.C., R.H.S., May 25. Mons. Chas. Vuylsteke, Loochristy, Ghent.

ODONTOGLOSSUM AGLAON.

Another fine hybrid of excellent form and splendid colouring. The flowers are rich chocolate-red with rosy margins and markings. The lip is very bright, the margin is almost white, and the crest deep orange-yellow. F.C.C., R.H.S., May 25. Mons. Chas. Vuylsteke, Loochristy, Ghent.

LÆLIO-CATTLEYA EURYLOCHUS.

A very bright and beautiful new hybrid, derived from Cattleya Shofieldianum and Lælio-cattleya Lady Miller. The flowers are about four inches across, and as the segments are broad and rounded the flowers are of excellent form. The colouring is rich orange-scarlet on sepals and petals, but the basal portion of the lip that encloses the column is orange-yellow, and the neat rounded apex is deep crimson, with a thin edge of deep rose running all round the frilled margin. A very pretty and attractive orchid. F.C.C., R.H.S., May 25. Messrs. Charlesworth and Co., Haywards Heath, Sussex.

CATTLEYA MOSSIÆ GATTON PARK VAR.

A handsome variety, with very broad lilac-coloured petals and similarly coloured sepals. The lip has a yellow throat, and this colouring extends almost into the frill at the end of the tubular portion. The apex is freely marked with bluish-purple over a paler ground. A.M., R.H.S., May 25. Sir Jeremiah Colman, Bart. (gardener Mr. Collier), Gatton Park, Reigate.

IRISES.

Sir Dighton Probyn.—A fine bearded iris with large bold flowers. The falls are reddish with a small crimson blotch at the end of the dull orange crest. The standards are purplish, with red veins. A.M., R.H.S., May 25. Mr. Amos Perry, Enfield.

Sir Trevor Lawrence.—Another handsome tall, bearded iris, of great size and substance. The broad standards are electric blue with dark veins, and the falls are purplish-blue with reddish veins over the lighter base, and a yellow crest. A.M., R.H.S., May 25. Mr. Amos Perry, Enfield.

FICUS AUSTRALIS VARIEGATA.

The typical Ficus australis is an evergreen stove plant very much like the ever-popular F. elastica. The new variety differs from the type in having very brightly variegated leaves, that, in the case of the quite small plants shown, were about five inches long by three inches broad. The pale green midrib has an irregular area of deep green on either side, but this does not extend to the apex. There are also small areas of greyish-green running into the deeper shade, but all the rest of the leaf is light yellowish-green. Grown as small plants, six inches to a foot high, F. australis variegata is a very useful foliage plant. A.M., R.H.S., May 20. Messrs. Sander and Sons, St. Albans.

CARNATION CAROLA.

We have previously referred to this magnificent perpetual-flowering carnation. It is a grand flower, both in size and colour, the latter being both deep and brilliant, and in no sense dull. The petals are fringed, very large, and substantial. Stems and calyx are excellent, and in size the variety stands out well among its compeers. A.M., R.H.S., May 25. Mr. C. Engelmann, Horneybrook Nurseries, Saffron Walden.

BEGONIA PINK PEARL.

An exquisitely beautiful double tuberous begonia, with large blooms that are a delightful shade of pink, with a suspicion of salmon in it. Each flower is about six inches across, and composed of broad, thick petals that retain their fine form until they fade instead of collapsing and reflexing, as in so many varieties. One plant, in a 32-sized pot, carried eight of these splendid blooms. A.M., R.H.S., May 25. Messrs. Blackmore and Langdon, Twerton-on-Avon, Bath.

MARGUERITE WHITE PERFECTION.

In this very useful variety of a popular greenhouse and bedding plant the flowers are large, of the purest white, and in most cases very double, the central florets having developed like ray florets, so as to form a pyrethrum-like flower. In a few instances the centre is corona-like, as in Queen Alexandra, a variety from which White Perfection has descended. A.M., R.H.S., May 25. Messrs. G. and A. Clark, The Nurseries, Dover.

ROSES.

Jessie.—This is a new, interesting, and useful little rose belonging to the dwarf polyantha section. It has a very neat habit of growth, and flowers very freely, producing large clusters of double, bright crimson blooms. The variety is described as perpetual flowering, and as having the merit of keeping its colour instead of developing magenta-purple shades as it fades. A.M., R.H.S., May 25. Messrs. H. Merryweather and Sons, Lim., Southwell, Notts.

American Pillar.—Without a doubt this is one of the very finest of the new roses,

TEMPLE SHOW—A CHARMING JAPANESE GARDEN.
Arranged by Messrs. James Carter and Co.

and it was the most striking variety at the Temple Show. It is of free, robust habit, and wonderfully floriferous, producing immense branching heads or trusses of big single flowers. Each flower is from two to three inches across, brilliant rosy-pink flushed with red, and with a lighter base to each petal that makes a delightful setting for the central cluster of golden anthers and stamens. On one head of bloom, by no means the largest we could find, we counted forty-eight flowers and buds; a few flowers were fallen, about twenty were expanded, and there were about twenty buds to follow up the display. A.M., R.H.S., May 25. Messrs. H. Cannell and Sons, Swanley, Kent.

Margaret.—A very beautiful hybrid tea rose, with big shapely blooms of a lovely pink shade, slightly flushed at the base of the petals with salmon. The shape of the flower is suggestive of Maman Cochet. The petals are very stout and broad, and the flowers are very fragrant. This promises to be a useful garden and exhibition rose. A.M., R.H.S., May 25. Messrs. William Paul and Son, Waltham Cross.

Coquina.—This rose improves with acquaintance. It is a single-flowered rambling variety, with neat, bright green foliage and elongated trusses of shell-pink flowers, each bloom about an inch across, and rather cup-shaped. The petals do not open out flat as in many single roses. Coquina is a most profuse bloomer, and makes a charming pillar rose. A.M., R.H.S., May 25. Messrs. William Paul and Son, Cheshunt.

Mrs. Taft.—This is a free-growing polyantha variety, every growth producing an erect spike or truss of neat double flowers. The colour is deep rose. Each flower is about an inch across, and has a fairly long stalk, so that the trusses are light and elegant. It makes a very good pot plant, as well as a good bedder. A.M., R.H.S., May 25. Messrs. Hugh Low and Co., Enfield.

PTYCHORAPHIS SIEBERTIANA.

An elegant palm with gracefully arching leaves, that have numerous narrow deep green divisions. New or rare palms are not often placed before the public nowadays, consequently a newcomer creates a good deal of interest, as did this one. A.M., R.H.S., May 25. Messrs. Sander and Sons, St. Albans.

OBITUARY.

MR. F. W. CRUMP.

We regret to record the death of Mr. Frederick William Crump, which occurred at the Madresfield Court Gardens on the 31st ult., from cancer. Mr. F. W. Crump, who was in his twenty-fifth year, and a son of Mr. William Crump, V.M.H., had given promise of attaining a high position as a marine engineer, and much sympathy is felt for his parents in the loss they have sustained by his untimely death.

Diascia Barberæ.—This interesting subject is easily raised from seed sown under glass in spring, and treated in all respects similar to half-hardy annuals. It succeeds in any light rich soil, forming bushy specimens some 15 inches through, and about the same in height; the flowers are hooded, each having a short keel or spur, and are produced upon wiry stems in the forms of erect spikes. The lower flowers on each stem open first, and a succession is maintained throughout summer as the spikes elongate. The flowers are produced very freely, so that the plant can be employed to excellent purpose for massing in beds and borders, and as seed is only sparingly produced, the floral display is never adversely influenced by this process, as is the case with the majority of annuals, and, consequently, the flowering season extends into late autumn. The colour of the flowers is chamois-rose, though a small percentage have pale orange-coloured flowers. I have seen it stated that Diascia Barberæ is perennial on dry soils, but this is contrary to my experience upon well-drained limestone soil.—Thomas Smith.

THE PRINCIPLES OF HEREDITY.

At the meeting of the Royal Society of Arts held on May 12, Dr. Arthur Dendy, F.R.S., Professor of Zoology in King's College, delivered, under the Aldred Trust, a lecture on the principles of heredity as applied to the production of new forms of plants and animals. In view of the interest that is being taken in the matters dealt with by Dr. Dendy, we reproduce herewith, by the courtesy of the society, the lecture in a slightly abbreviated form.

The history of the progress of mankind is the history of the wresting of one secret after another from the book of Nature, and of the application of the knowledge thus acquired to the control, for the benefit of man, of the natural forces by which he is surrounded. The investigations of the physical sciences have resulted in an incalculable amelioration of the conditions of human existence, and have at length paved the way for the attack upon those problems which are more particularly concerned with life itself. The conquest and control of the inorganic world are far advanced. The physical forces of inanimate nature are yoked to the service of man; but what of life? How far can we control, how far can we even hope to control the forces which determine the character of living things, the character of man himself? This is the problem before us, and you will at once see that it is of such a nature that we cannot, in the brief time at our disposal, do more than indicate some of the lines along which the attack is being led, and some of the successes which have already been achieved.

The development of any science may be roughly divided into two stages: the observational, in which it is thought sufficient to observe and record what takes place in nature uninfluenced by human interference, and the experimental, in which the observer puts his own finger into the pie, and thereby intentionally modifies the result. Man might almost be defined as the experimental animal, and the same instinct which causes a small boy to throw a stone at a street lamp, for the pleasure of observing the effect of his action, leads, also, when properly directed, to the discovery of such things as radium and wireless telegraphy.

Biology is only just entering upon the experimental stage. We have too long been content to take our walks quietly in the dimly-lit streets of nature, without ever troubling ourselves to break a lamp in order to find out where the light comes from.

Observation, however, has enabled us to survey the ground, nor has experiment been entirely wanting. During the last hundred years we have learnt much of the nature of the problem which we wish to solve. Physical and chemical science have led the way, as they always must. The discovery of the microscope and the improvement of microscopical technique have taught us much concerning the physical and chemical composition of living things.

Cell Theory.

After the discovery of protoplasm, or what Huxley so aptly termed the physical basis of life, one of the greatest intellectual triumphs of the nineteenth century was the elaboration, by numerous biologists, of the cell theory. We know now that the body of every living organism is, with certain apparent exceptions which do not seriously affect the general result, built up of one or more minute nucleated masses of living protoplasm, the cells or organic units. In the simplest plants and animals, for the most part visible only with the aid of a microscope, the entire body is but a single cell, a single speck of gelatinous protoplasm, usually with a differentiated nucleus somewhere near the middle. From this simple condition, through endless grades of ever-increasing complexity, we pass to the higher and larger plants and animals, in which many millions of nucleated protoplasmic cells are united together in one individual body and variously modified in structure for the fulfilment of a vast variety of different functions.

We have also learnt that these microscopic cells are capable of self-multiplication by division, and that it is upon this property of the cell that the growth and development of all living organisms depends, for however complex the adult plant or animal may be, it always starts life as a single cell unit, or, to speak more accurately, of a cell unit which is formed by the combination of two cells, the male and female germ-cells or "gametes."

For some time it was supposed that with the discovery of the cell and its nucleus we were approaching the limit of the microscopical analysis of the animal or vegetable body. The researches of the last thirty years, however, have revealed a perfect microcosm of elaborate structure in the nucleus itself, the outstanding feature of which is the appearance, at the time when division is about to take place, of a number of bodies to which, on account of the avidity with which they absorb certain dyes, the name "chromosomes" has been applied. That these chromosomes must be of vital importance to the organism which possesses them is clearly indicated by several facts. Thus they are nearly always constant in number, not only in all the cells of the body, but in all the individuals of any particular kind or species of plant or animal, though differing in number in different species; and at every ordinary cell-division the equitable halving of each individual chromosome is effected by means of a complex mechanism specially adapted for the purpose, in the elaborate process which is termer karyokinesis or mitosis. No less remarkable is the fact that, at a certain period in the life history of each individual, half the number of chromosomes present are thrown out from those particular cells from which the sexual reproductive cells or gametes are destined to arise. Thus it happens that the nucleus of the germ cell of an animal or plant, whether male or female, has only half the number of chromosomes which we may consider to be characteristic of the species. But, before the egg-cell can begin to divide and thus develop into a new organism, it has to be fertilised by the sperm cell. The act of fertilisation consists in the complete fusion of the male and female gametes or germ-cells to form a compound cell or zygote. Each parental nucleus brings with it half the proper number of chromosomes, and thus the zygote, or fertilised egg, starts life with a full complement of these bodies, half of which are derived from each parent.

These facts, thus baldly narrated, but established beyond the possibility of doubt, seem to indicate that the chromosomes are extremely important things, and not a few biologists are inclined to regard them as the actual bearers of the characters which an organism inherits from its parents. We cannot say that this view is yet firmly established, but we shall see that it fits in very well with the results of experiments on heredity, and we may at any rate adopt it as a provisional hypothesis. We must be careful, however, to guard against looking upon even the chromosomes, minute as they are, as simple bodies, for each one is probably made up of many thousands of units, which are quite beyond the limits of microscopic vision, and it is these that are supposed to be the representatives, so to speak, of the different characters which are transmitted from cell to cell and from generation to generation.

Observation has thus enabled us to establish the existence of a material foundation for the transmission of characters from parent to offspring. We know that every child, if not exactly a chip of the old block, is certainly a combination of chips from two old blocks, and that the protoplasm which forms the material basis of all living things is continuous by means of the germ-cells or gametes, in an unbroken stream from one generation to another. At each act of sexual reproduction, however, two such streams are mingled, and the offspring receives half its initial stock of protoplasm from one parent and half from the other, each half bringing with it all the potentialities which may have been derived from a long line of ancestors.

The Problem of Heredity.

We must now direct our attention to the results which have been obtained by the experimental method of attacking the problem of heredity. In the early part of the nineteenth century much attention was paid by horticulturists to experiments on the hybridisation of plants, and many such experiments are, of course, still being frequently performed. It was soon found that, within certain limits, it was possible to fertilise the flower of one variety of plant with the pollen of another variety, and in this manner to alter the character of the offspring. Many crosses or hybrids between different varieties were thus obtained, differing in various ways from the parent plants. It was also found that by repeatedly fertilising the flowers of one variety with the pollen of another the descendants of the first could be entirely changed into the second. This clearly proved that all the distinctive characters of the male parent were in some way represented in the pollen grains, and could be transmitted by these to future generations, but it also proved something more: it proved that it was possible to eliminate the special characters of the female parent, or at least to prevent them from manifesting themselves in the offspring.

We must remember, of course, that the process of fertilisation in plants, as in animals, consists essentially in the union of two sexual cells, or gametes, of which the female egg-cell is contained in the so-called "ovule" in the "ovary" of the flower, and the male sperm-cell in the pollen grain.

As a rule, it is only possible to bring such experiments to a successful issue when working with closely related species or varieties. The flower of one kind of orchid, for example, may perhaps be fertilised by the pollen of a different orchid, but the pollen of such a plant as a lily would probably not have the slightest effect upon it.

The first observer to throw a clear light upon the meaning of the remarkable results obtained by hybridisation was Gregor Johann Mendel, a native of Austrian Silesia, born in 1822, whose work has recently attracted so much attention. As Abbot of Brünn, he was the happy possessor of a garden, and presumably also of that peace and quiet which are so essential to intellectual work. He was not content with merely casual experiments in hybridisation. In the seclusion of his cloister he had time to think about what he was doing, and he attacked the problem in the true scientific spirit. Unfortunately for science, however, his seclusion was a little too complete. He was content to publish his results in 1865 and 1869 in the proceedings of a local natural history society, where they remained buried and almost unnoticed for more than thirty years. Thus, by the irony of fate, our own illustrious countryman, Charles Darwin, the hundredth anniversary of whose birth we celebrated this year, never heard of those remarkable discoveries which bid fair to solve some of the problems in which he himself was so deeply interested.

(To be continued.)

The Lyon Rose.—I was pleased to see such an excellent illustration of this rose in the GARDENERS' MAGAZINE, p. 397, which represents the variety in its true character. At the time the illustration appeared I had a small plant in a four-inch pot carrying one fully-developed bloom, the result of a graft put on in January of this year, which proves what a valuable rose this will be for obtaining plants of that character for various forms of decoration. Its growth is quite vigorous, and the blooms are supported on stiff, erect well-foliaged stems. As you say, the colour is exquisitely beautiful. I do not know another variety quite so attractive in colouring. The yellow overlying the coral-red is indeed exquisite. Growing in the open, too, this rose promises well, and I shall be much surprised if this variety does not become immensely popular.—E. MOLYNEUX.

NOTES FROM SCOTLAND.

◆

The Season's Prospects.

It is feared that the hopes and high anticipations of horticulturists and others engaged in the raising of crops for the early markets, have been considerably modified by the devastation wrought by the almost Arctic severity of the weather during the past week. The most trying period occurred on the mornings of the 15th and 16th, when several degrees of frost were registered in the most highly-favoured localities; while in many others, snow and frost to an extent very seldom experienced so late in the season, prevailed.

As a result of this, the early potato crops are everywhere badly injured, the flourishing appearance presented a week or more ago being changed completely, as in many instances, not a green leaf remains. In others, where the crops were within the tempering influence of the sea breezes, the damage is less, but still a check is given from which the plants will not quickly recover. In this it is marvellous how a shoot here and there escapes injury, while all others around are destroyed, and this may sometimes be witnessed with two shoots ascending from one tuber, the one being reduced to pulp and the other scarcely discoloured.

It is fortunate in some respects that the season is so late, as maincrop varieties generally have not yet made an appearance above ground, and therefore, presumably, are safe.

The Fruit Crops.

Hardy fruits of all kinds that have already passed the flowering stages gave great promise of full crops, as the bloom was profuse and the weather generally favourable to its setting.

Plums, cherries of dessert kinds, peaches, and early pears were, and still are, very promising, and most varieties of each species are bearing full crops; but whether recent low temperatures will cause the fruit to fall prematurely remains to be seen. Gooseberries and currants are equally satisfactory, and strawberries, though less advanced, give promise of an abundant show of blossom. In this particular district, the frost came at a time when but few fruit trees were in full bloom, the kinds mentioned being mostly past that stage, and strawberries, Morello cherries, and apples being, with few exceptions, more backward, have probably thereby escaped.

Flowering Shrubs and Trees.

Huge bushes of Rhododendron Russellianum and a few other varieties, for which this place is famed, were, at the time stated, at their best, but now nearly every truss of bloom is destroyed. The young growths of larch, and many evergreen trees and shrubs have suffered severely, as also have many deciduous kinds, as the beech, sycamore, lime, and elm; and in respect to these the charming beauty and freshness of spring, so much appreciated by everyone, is sadly marred. JAMES DAY.

Galloway House, Garlieston,
Wigtownshire.

Licences to Sell Weed Killer.—In many parts of the country considerable objection is being raised by chemists against the granting of licences to seedsmen and nurserymen permitting them to sell weed killers, and other poisonous substances used for agricultural and horticultural purposes. We have not heard of a definite refusal to grant such licences, but at Cardiff, Dundee, and elsewhere the opposition has been very strong.

SOUTH SHIELDS and NORTHERN COUNTIES CHRYSANTHEMUM SOCIETY.
ANNUAL EXHIBITION, in the ROYAL ASSEMBLY HALL, SOUTH SHIELDS, on WEDNESDAY and THURSDAY, November 10th and 11th.
£150 in Prizes, Seven Silver Cups, Medals, etc. First Prize for 36 Japanese, £10.
Entries close Nov. 5. Schedules and all particulars from
ALLEN PURVIS.
63, King Street, South Shields.

WOLVERHAMPTON FLORAL FETE.
COMING OF AGE SHOW.
13, 14, and 15 July, 1909.
Special features in greatly increased
PRIZE LIST, £900.
Prize Schedules on application to the Secretary.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, May 18.

Present: Mr. E. A. Bowles, M.A., F.E.S. (in the chair); Professor A. H. Church, F.R.S., Dr. A. B. Rendle, F.R.S., Dr. A. Vœlcker, F.L.S., Messrs. R. H. Curtis, H. J. Veitch, V.M.H., W. Cuthbertson, A. W. Sutton, V.M.H., W. Hales, A. Worsley, G. Gordon, V.M.H., J. T. Bennett-Poe, H. T. Güssow, F. J. Baker, L. Crawshay, W. Fawcett, F. J. Chittenden (hon. secretary), and E. H. Wilson (visitor). The committee heartily welcomed Mr. E. H. Wilson on his return from his journey of botanical exploration in Western China.

ROSE WITH FOLIAR SEPALS.—Lieut.-Colonel J. W. Currie, F.R.H.S., of Norwich, sent a specimen of the Rose Niphetos having one of the sepals developed into a perfect leaf with five leaflets and stipules well developed. While the peculiarity is not rare, so perfectly developed a specimen as this is seldom met with.

RANUNCULUS AURICOMUS. — Dr. Rendle showed specimens of the depauperate form of R. auricomus with one or two petals only in some flowers, and in others the petals scarcely developed. This species often has very imperfect flowers.

SALIX PENTANDRA.—Mr. J. Fraser showed specimens of the flowers of Salix pentandra in which the posterior gland had proliferated and given rise to two or three small pistils in addition to the normal one. He pointed out that in the genus populus belonging to the same family as salix there is a perianth, and that Bentham had regarded the gland in salix as homologous with the perianth of populus. He found on examination of the frequent cases of abnormal development of this gland or disc in Salix pentandra, considerable grounds for believing Bentham's view to be the correct one. Frequently the gland became so much developed that it grew almost three parts round the pedicel of the ovary.

VIOLA LUTEA AND V. LUTEA AMŒNA.—Mr. Fraser also showed specimens of these two violas collected in meadows at considerable elevations in Scotland. He said that the Scotch raisers of the garden violas had used this species in their formation, and from it had been derived the perennial habit of these species. Mr. Cuthbertson corroborated the statement, saying that this had been the case in 1859 and 1860, but he thought that little good could be likely to arise by re-crossing the species with the violas of the present day, since they were so generally hardy and perennial. He had planted over 100 varieties in an Essex garden in October, 1907, and had found that a very large proportion of them had survived even the severity of the past winter, the varieties Royal Sovereign and Bullion being particularly noticeable in this respect.

FROST INJURY.—Mr. F. J. Baker showed leaves of peas having white patches upon them from Cambridgeshire. They seemed to show signs of albinism, but were also injured by frost. It is possible that the latter was connected with former phenomenon, since, as Professor Church pointed out, the albino spots upon a leaf always contain a larger percentage of water than the green parts, and thus are probably more liable to injury by frost than the green parts. There is also always less lime and potash in the white parts of a variegated leaf than in the green.

PRIMULA HYBRIDS. — Mr. H. J. Veitch showed a series of crosses between Primula pulverulenta and P. Cockburniana. These are both native of Western China, the former being of a rich purple colour and perennial, and the latter orange. The series was as follows:

P. pulverulenta ♀ x P. Cockburniana ♀ gave P. x "Unique" (cerise), while the reciprocal cross gave P. x "Unique Improved," differing somewhat in colour from "Unique," being somewhat darker, but of similar habit. These hybrids are perennial.

P. Cockburniana ♀ x P. x "Unique" ♀ gave a plant bearing terra-cotta flowers nearly the colour of P. Cockburniana, but with the habit of P. pulverulenta, to which the foliage bore a great resemblance. This would appear to be perennial, since the plant which flowered last year is again in bud.

P. pulverulenta ♀ x. P. x "Unique Improved" ♀ and P. x "Unique" ♀ x P. pulverulenta ♀ were almost identical in colour of flowers, just a little brighter than P. pulverulenta, while when the plant raised by crossing P. Cockburniana and P. "Unique" was fertilised from that raised by crossing P. x "Unique" and P. pulverulenta, the colour of the flower showed a greater variation from P. pulverulenta, and was of a warm cerise.

ABNORMAL TULIP (NEW SEEDLING VARIETY).—A correspondent sent specimens of abnormal tulips, which were in all respects normal florists' breeders, except that the three inner petals of each possessed a couple of small spurs near the base pointing inwards. The malformation is constant, and recurs each year; it is found in all the offsets that have arisen from the original seedling, and is evidently characteristic of the variety. Both plants were normal, as were all the other seedlings raised from the same parents; indeed, no similar structures in a tulip bloom have fallen under the raiser's observation either among tulip species or some 1,500 other seedlings of florists' tulips. Somewhat similar formations to these are sometimes met with among tulips, but no member of the committee had before seen specimens where the abnormality was so regularly and symmetrically developed.

ORCHID HYBRIDS.—Mr. G. Wilson sent flowers of seedlings of the cross Dendrobium nobile album x D. Findleyanum (= D. x "Cybele"). All the seedlings which had flowered (about sixty) had borne coloured flowers approaching D. nobile, with one exception, where the flowers were white with a faint pink tinge.

PISUM SP., ETC.—Mr. A. W. Sutton showed plants in flower of the wild pea collected in Palestine, which he had before exhibited, and of P. quadratum, to demonstrate the fact that the two were not identical. The seeds of the two are very similar to one another, but the mature plants differ particularly in the amount of serration of the leaves.

Mr. Sutton also showed the plant of asparagus which had been collected in the Himalaya, but the committee desired to see it again when it was in flower.

IMPATIENS X COMORICOMA.—Mr. H. J. Veitch showed, on behalf of Messrs. Cayeux and Le Clerc, of Paris, plants of the hybrid impatiens x comoricoma raised from I. comorensis and I. auricoma, the former with rose flowers, the latter with yellow, those of the hybrid being "rouge chaudron eclairé de jaune soufre, striées de carmin sur les bords intérieurs des pétales latéraux." The anterior sepal of I. comorensis is white, and of I. auricoma yellow, while in the hybrid it is yellow striped in the lower part with carmine. A table comparing the hybrid with its parents is given along with an account of the raising of the hybrid in the "Revue Horticole," September, 1908, pp. 427-428.

UNCOMMON CONIFERS.—From Sir Edmund Loder, Bart., Leonardslee, came branches with cones of the uncommon conifers Larix Griffithi and L. americana.

Kew Guild.

The annual meeting of the Kew Guild, held at the Holborn Restaurant at the close of the first day of the Temple Show, instead of on the eve of the show, was not so well attended as usual. Mr. Watson presided. There was an undercurrent of distrust evident in respect to the "Forward Movement," and five members of the committee, including the secretary and treasurer (Messrs. W. N. Winn and H. H. Thomas) resigned as a protest. The meeting felt, however, that these gentlemen were sufficiently strong to prevent the management from launching into matters outside the province of the guild, and consequently re-elected them all. The balance on the year's accounts showed a profit of £32 6s. 2½d., and the capital account stands at £332 6s. 2½d.

The annual dinner was presided over by Dr. Burrell, M.A., the medical officer for the Royal Gardens, Kew, who urged the cultivation of the Old Boy spirit of brotherliness, and pointed out that the importation of controversial matter into such a body as the guild was certain to prove disastrous.

Mr. E. H. Wilson, the celebrated collector, responded for "The Guild," and he pointed out that the gathering was an unusually small one, and there was a sense of "something wrong" abroad, and this did not tend to increase that adhesion and love of the members that was so marked a characteristic of Kewites as he had found them in all parts of the world. What was the matter? When proposing "The Chairman," Mr. Watson made it evident what was the matter, as his speech—an excellent one—was an argument for the use of the guild and its members as a means to advance Socialistic views, and the argument fell flat. Dr. Burrell traversed the points raised by Mr. Watson, and, judging from the applause that punctuated his remarks, the great majority of the members were in sympathy with him, and not with the ideas set forward by Mr. Watson.

We append the report and balance-sheet:

H. COWLEY,

ANNUAL REPORT.

"The committee beg to present the report for the year ended April 30, 1909. The receipts for the year amounted to £54 17s. 8d., including 16 life subscriptions. The total number of life members is now 269. The expenditure was £43.

"The annual general meeting took place, as usual, at the Holborn Restaurant. Mr. Watson presided. A report of the proceedings will be found in the 'Guild Journal' for 1908, p. 402. The resolution adopted at the last annual meeting with regard to the 'Journal,' etc., was submitted to the whole of the members, and the result is recorded in the 'Guild Journal' for 1908, p. 410, "The Forward Movement.' It will be seen that a large majority voted for the resolution. In consequence of this decision the following members of the committee have decided to resign Messrs. W. Dallimore, H. Spooner, W. Hales, W. N. Winn (secretary), and H. H. Thomas (treasurer). It will be necessary, therefore, for this meeting to elect members to replace them. Rule III., with respect to the retirement of members, will be in abeyance this year.

"The annual dinner took place, as usual, at the Holborn Restaurant, Mr. W. W. Pettigrew was in the chair. There were 86 members present.

"The committee regret to have to report the death of the following members: Messrs. G. Nicholson, H. Millen, W. R. Elliot, D. Stalker, and Mrs. R. Ward (Jessie Newsham).

"The auditors for the present year are Messrs. C. P. Raffill and H. Cowley."

Bristol Gardeners' Association.

The first meeting of the new session was held on May 27, at St. John's Parish Rooms. Mr. W. E. Budgett presided over a large attendance. Mr. Brooks gave a lecture upon "Fads and Fancies of Gardeners and Gardening." The lecturer gave some reminiscences of visits he had made to gardens in his travels, mentioning the peculiar fads of many gardeners, some having a perfect mania for buying everything new offered, others had fixed dates for sowing seeds. In fact, none had more fads and fancies than sons of the soil. The Chairman opened the discussion, and was followed by several others. An interesting part of the proceedings was the presentation of silver medals to three young members for making the maximum number of attendances during the past session—Messrs. House, jun., Coombs, and Whiting; two others received framed certificates, only missing once. Three new members were elected.

For three bunches of hardy flowers Mr. Binfield was first, Mr. Holt second. Judging by points, Mr. Garnish was awarded three for six bunches of sweet peas; Mr. Thoday two, for a collection of vegetables; Mr. Scott two, for carnations; Mr. Curtis two for a renanthera; Mr. Shelton two for dendrobium thyrsiflorum; and Mr. Bird two for calceolarias. Votes of thanks to lecturer and chairman closed a most successful meeting.

VEGETABLE CULTURE IN THE VALE OF EVESHAM.

From a most interesting article, entitled "Market Gardening in the Vale of Evesham," contributed to the "Journal" of the Royal Agricultural Society by our friend Mr. James Udale, we extract the following notes on vegetable culture:

"The path is called the Little Abbey Lane, and covers what were formerly the cloisters of the great church from the gardens of the monastery. These gardens, which were in cultivation by the monks of Evesham more than one thousand years ago, formed the beginning of that great market-garden industry which has now become so widely extended in the town and neighbourhood, and gives to the district the title of 'The Garden of England.'" This quotation from Smith's valuable publication, "Evesham and its Neighbourhood," briefly indicates the earliest site and commencement of a most important and flourishing industry in the county of Worcester. And although this industry now extends from its centre at Evesham into Warwickshire and Gloucestershire, yet nearly the whole of it is in Worcestershire.

Fifty or sixty years ago the total area of land devoted to market gardening and fruit growing near Evesham has been estimated at from 500 to 600 acres; now (December, [illegible]) the total area within a radius of ten miles of Evesham devoted to this industry is estimated at 15,000 acres. The area within seven miles of Evesham alone is estimated at 10,000 to 12,000 acres; the present area being supposed to be about double what it was twenty-five years ago, so rapidly has the industry extended.

The pioneers fifty-five years ago were men of such well-known names as Myatt, Mas[illegible], Cole, New, and Byrd; to these men belongs the credit due for continuing and more firmly establishing such profitable and prosperous work. To the late Mr. [illegible] Myatt we are indebted for "Myatt's Early Prolific" potato, "Myatt's Early Offenham" cabbage (the best for commercial purposes), "Myatt's Victoria" rhubarb, several strawberries of sterling merit, and other vegetables and fruit.

In more recent years young men of good family and education have settled in the district and embarked in market gardening with more or less success; but bearers of the old names—descendants of those previously mentioned—occupy the leading positions.

It is not uncommon, also, to find instances where steady, industrious labourers commence with an allotment; then take a larger [illegible] and in three or four years more we find these men fully developed market gardeners, with their four, six, or ten acres of garden, horses and carts, and living in their own new, well-fitted, and well-furnished homes.

Of the eight main vegetable crops grown, the estimated area is as follows:

	Acres.
Asparagus	700—1,000
Cabbage (for cutting in March and April)	1,000
Beans (runner)	500
Marrows	200—250
Onions (for use as salad in the early months of the year)	150—200
Lettuce (for use in March and April)	100—120
Peas	2,000—2,500
Radishes	70—80

These are supplemented by early cauliflowers, broad beans, ridge cucumbers, parsnips, leeks, Jerusalem artichokes, and herbs.

Tomatoes are largely, and often profitably, grown in the district in the open air. Of these it is estimated there are grown 250 acres. During 1908 one man alone had 30 acres of tomatoes—a risk which some men would not care to take.

Wallflowers (gillies) and narcissi are largely grown as catch crops under the fruit trees, and are valuable aids to keeping the balance on the right side of the ledger. Violets also are grown to some extent in beds and borders in the open; and white pinks are grown as a profitable edging to the paths.

With regard to successional crops or rotation of cropping, this necessarily varies with the individual grower, and the kind of crops he cultivates. Broadly, cabbage is followed by the tomato crop, spring onions are followed by Brussels sprouts, radishes are succeeded by marrows or ridge cucumbers, or both, and broad beans are grown at intervals between, to form shelter. Often early cauliflowers are grown under hand glasses, and marrows between them. These, in turn, are succeeded by peas (early) or runner beans, and sometimes Brussels sprouts. Cauliflowers, if not taken, as before mentioned, under hand glasses, are planted after spring cabbage, the latter being cleared from the ground when quite young. The cabbages will have been dressed with some kind of fertiliser, and will thus leave the soil in "good heart," and quite capable of carrying another "green" crop without becoming unduly exhausted.

As animal manure is very scarce, other sources of plant food have to be utilised; and such fertilisers as fish guano, soot, nitrate of soda, and blood manure are very largely used. In a lesser degree recourse is had to muriate or sulphate of potash, kainit, bonemeal, and superphosphates.

There are six vegetable crops at least which receive special attention, viz., asparagus, cabbage, marrows, radishes, peas, and lettuce.

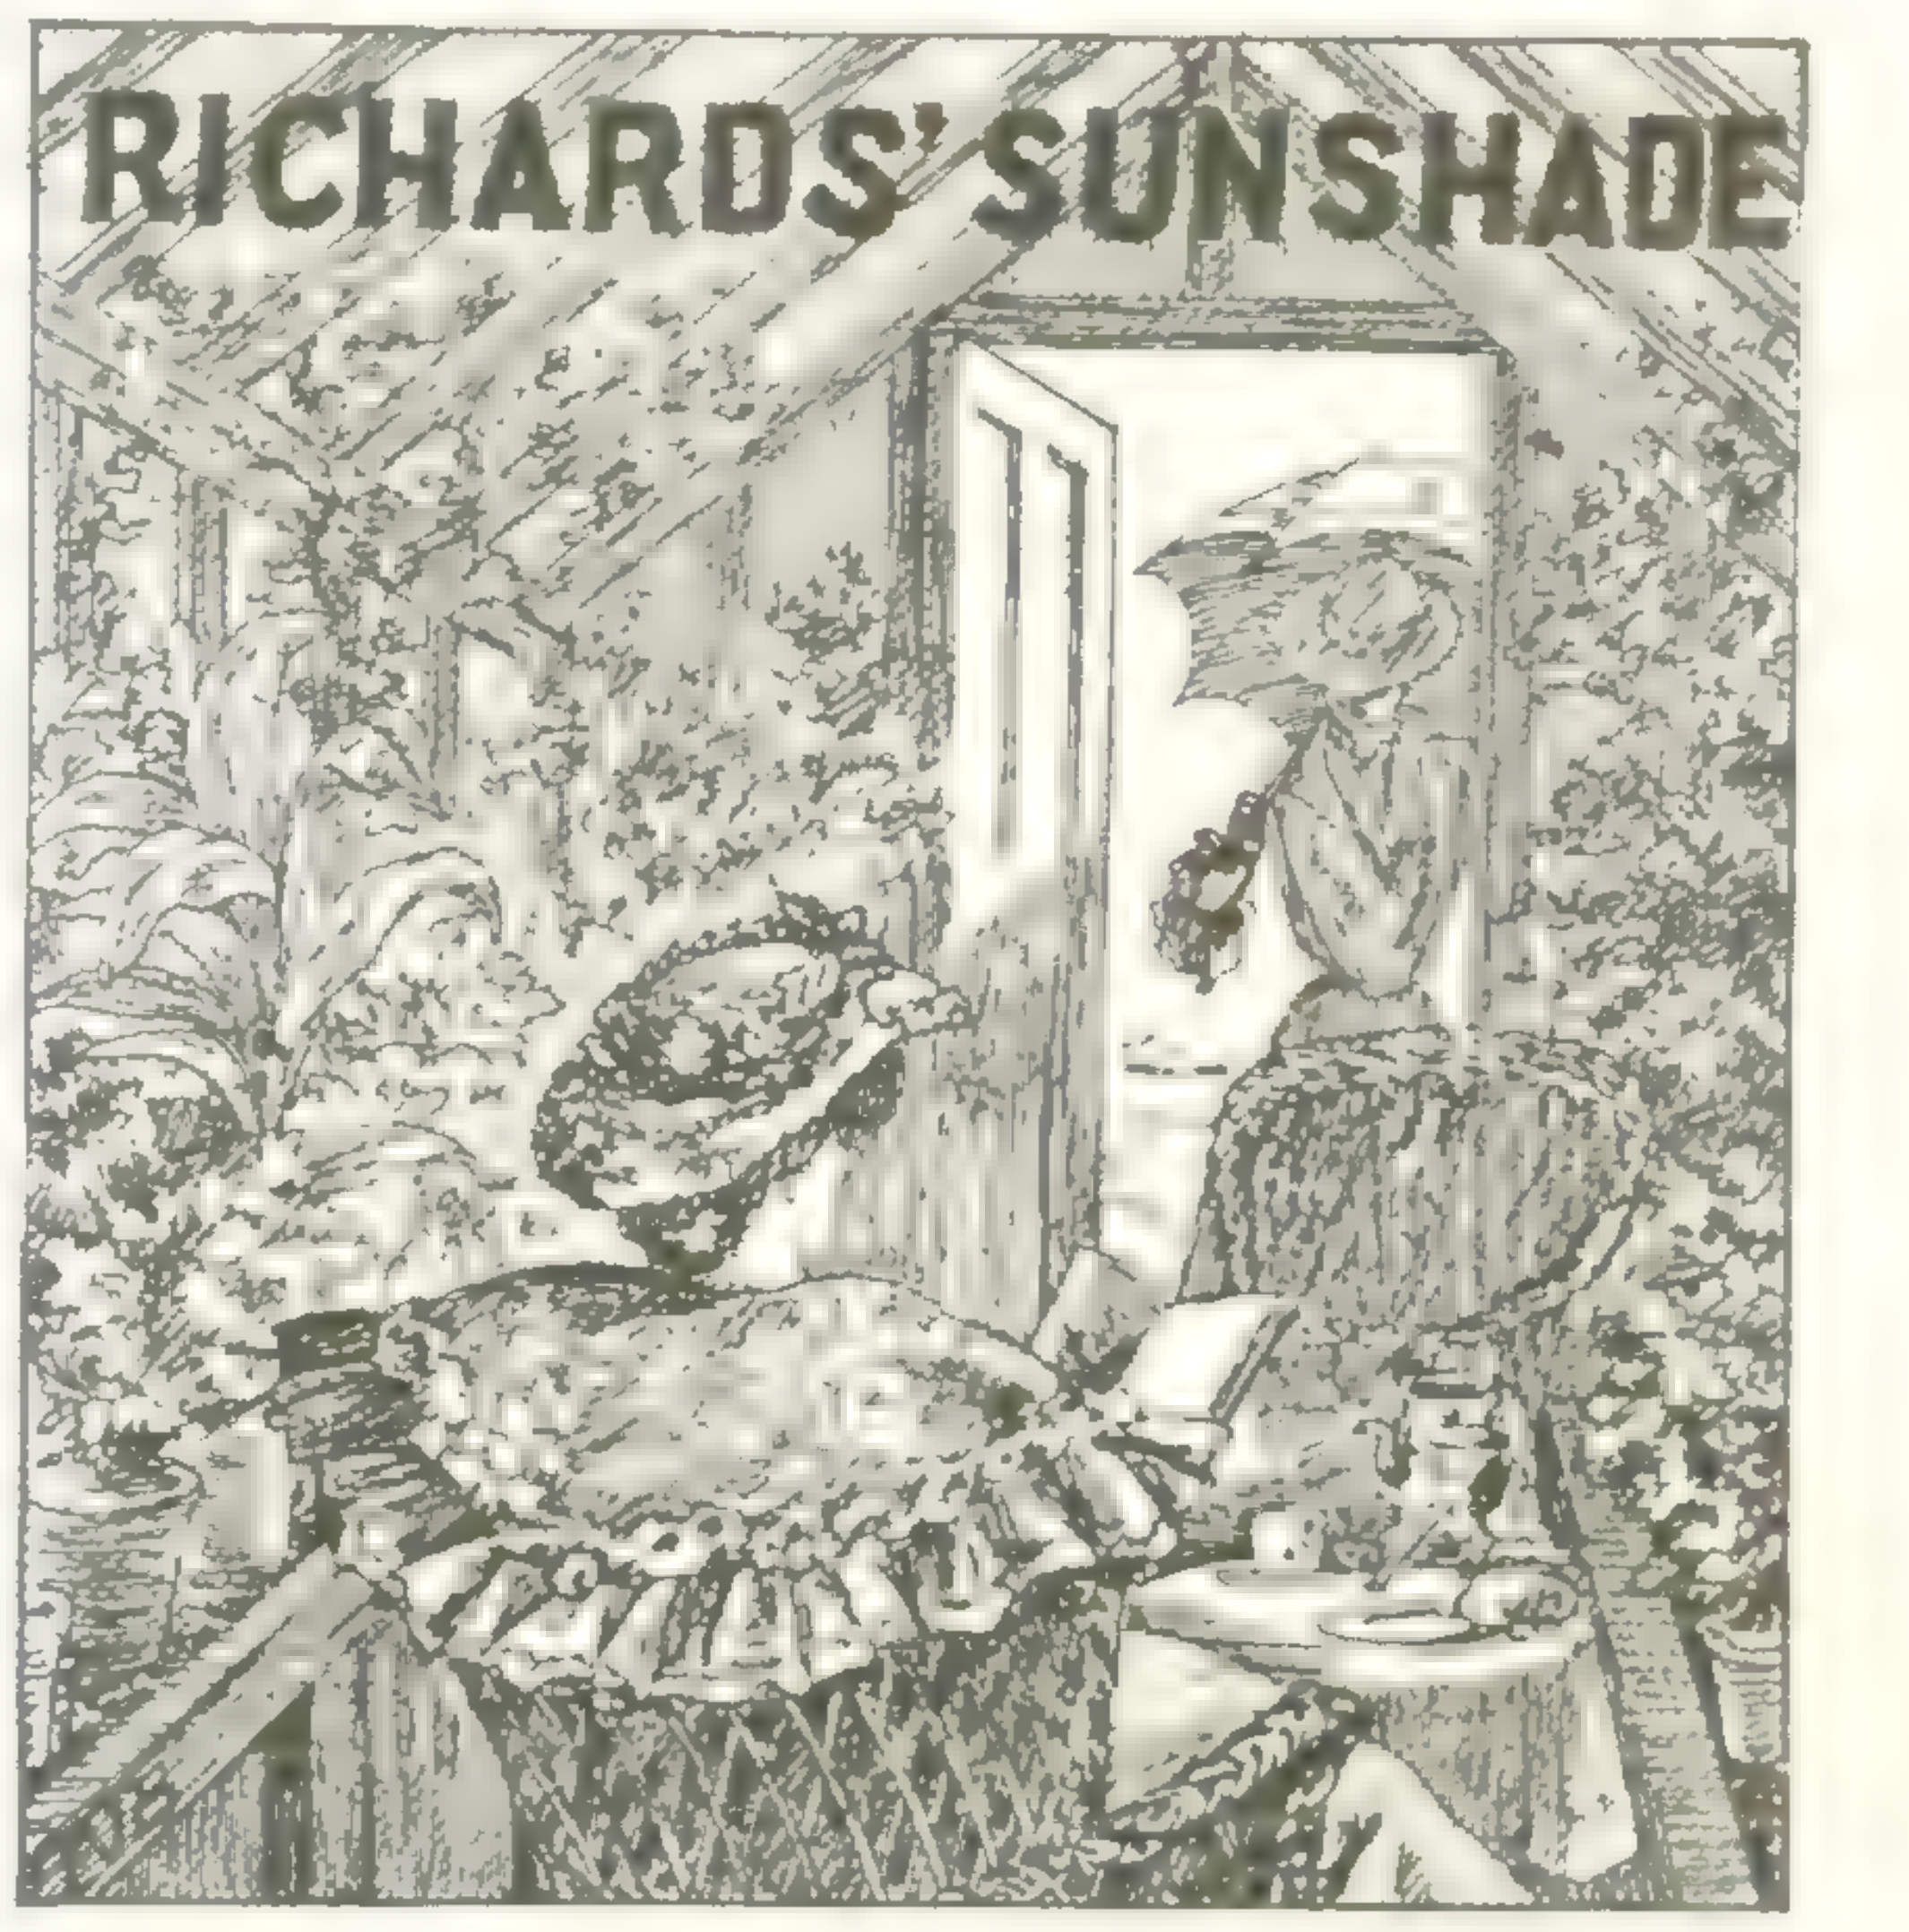
Asparagus, in value if not in area, stands first. It is grown, in almost all cases, in single rows, at 3ft. or 3ft. 6in. apart; but occasionally it is seen in narrow beds containing two rows, with a wide path or trench between. No special preparation of the soil is made, or required, for this crop. Sometimes the seed is sown where the plants are to remain; by this procedure some time is saved, but there is a consequent variation in the strength of the plants, and the size and quality of the asparagus produced. It is better to sow the seed in a bed, very thinly, in April, and to plant it out in the April of the following year, selecting the best plants only for the purpose. The subsequent cultivation mainly consists of manuring, earthing-up, cutting, and re-earthing during the season of cutting, weeding, diligently searching for the asparagus beetle (neglect of this being a frequent cause of failure), cutting down the stems in November, and levelling the ridges.

Cabbage, though equal in area, is seldom of the same value per acre. The seed for this crop is sown on beds in July. The young plants are planted out in September, and sometimes in October, in rows about 15in. apart, and about 12in. from plant to plant in the rows. They are frequently hoed, and in January and February dressing with fertilisers commences. The stimulants and hoeings promote early growth, and nice young cabbages are ready for cutting some time in March.

Marrows.—Sometimes these are raised from seed sown in pots, and placed in artificial heat in a greenhouse, frame, or hotbeds; but more usually the seed is sown where the plants are to grow and fruit. In the latter case holes are made at certain distances apart—the distances depending on whether the ordinary rambling plant be grown, or whether they be "bush" marrows, the latter being compact plants, about 4ft. across, and very fruitful; a forkful of manure is placed in the holes, the soil returned, a ring of metal 3in. or 4in. in depth, and about 12in. in diameter, is placed thereon, three or four seeds are sowed, and a disc of glass placed over the ring. This is done about the end of April. Some covering is required on cold and frosty nights, and various materials are used for the purpose; particularly is this protection from cold required when the seedlings are through the soil. With the warmer days and nights of June the glass is entirely removed, and the marrow plants fully exposed.

Early peas are usually sown in January, in rows 18in. to 24in. apart, on sheltered plots and protected borders. Sticks are seldom used, dwarf varieties only being grown. Harrison's "Eclipse," "William

Do Not Allow Plants Under Glass to be overdone and dried up by excessive sunshine. A 1/- packet will shade 100 square feet of glass.



R GD. TRADE MARK.

For Greenhouses, Conservatories, Garden Frames, and all other Glass structures which require shading. **"Sunshade"** is of a pleasing light green colour. It can be easily applied with an ordinary paint brush or with a garden syringe. Guaranteed to adhere firmly to the glass for the season. Rain will not wash it off; at the same time is easily removed with brush and water when necessary.

In 8 oz. Packets, 1/- each. 12 in a Box.

Single Packets or more can be purchased from any Nurseryman, Seedsman and Florist.

Hurst," "Daisy," and "Senator," being the varieties most favoured.

Lettuce.—A hardy variety of cabbage lettuce named "Schofield" is the variety mainly cultivated. The seed is sown early in August, and at the end of September strong plants are obtained for transplanting in breadths under the shelter of plum trees, from which, at that time, the fruit has been gathered. The soil must be fertile and clean; the lettuce plants are placed 6in. to 8in. apart, and beyond a little watchfulness for slugs, sparrows, and larks, little more attention is given to the crop.

Radishes—especially the earliest crops—are not so easily obtained as the general public think. Tender and juicy radishes can only be obtained from rich soil—soil rich in plant food and humus. The earliest crops are sown in December on borders sloping to the south, and these are sheltered from the north either naturally or artificially—often both. The seedlings are very tender in January and February, and easily destroyed; hence it is not uncommon to have to sow twice, and even thrice, to obtain a crop of early radishes. After the seed is sown and lightly raked in the whole border is covered with clean new straw. When the seed has germinated and the seedlings appear, this protective covering of straw has to be carefully removed on favourable days by a very long-handled rake, and be again returned over the seedling radishes in the evening; since, if they are not exposed to light they will perish, and if they be exposed to frost they will likewise perish. So the lot of the radish grower can hardly be described as "a happy one." Birds are troublesome to the later crops grown on the open plots, and these are scared by boys armed with various, and more or less harmless, weapons.

Tomatoes also must be considered as a special crop in and around the Vale of Evesham, and it has come into favour within the last twenty years. They go to supply the English and Scottish markets with cheap fruit during the months of September and October; and if the grower can obtain five or six farthings per pound clear he is amply repaid by a good crop. All are grown in the open, "glass" being conspicuous by its absence from such an important horticultural centre. The few gardeners who have one or two warm greenhouses supply their neighbours with young tomato plants at a cheap rate per thousand during the latter half of May. These are planted in rows about 4ft. apart, and 30in. or 3ft. apart in the rows, and tied and trained to a stout stick about 3ft. high. As previously stated, one man has grown 30 acres of tomatoes in 1908, but usually the area devoted to them by individual growers varies from half an acre to four acres.

FORTHCOMING ENGAGEMENTS.

SATURDAY, June 5.—French Horticultural Society of London.

MONDAY, June 7.—National Fruit Growers' Federation, council meeting.

TUESDAY, June 8.—Royal Horticultural Society; committees meet at 12 o'clock; lecture at 3 p.m. on "Some Old Superstitions about Plants," by the Rev. Professor G. Henslow, V.M.H.; Scientific Committee at 4 o'clock.

WEDNESDAY, June 9.—East Anglian Horticultural Club.

Royal Cornwall Show, at St. Columb; two days.

MONDAY, June 14.—United Horticultural Benefit and Provident Society.

TUESDAY, June 15.—Royal Meterological Society's Annual Dinner.

WEDNESDAY, June 16.—York Floral Fête and Gala; three days.

THURSDAY, June 17.—Linnean Society Meeting.

TUESDAY, June 22.—Royal Horticultural Society, Committees meet at 12 o'clock; at 3 p.m. the First Masters' Memorial Lecture on "Masters' Vegetable Teratology," by Prof. Hugo de Vries Scientific Committee at 4 o'clock.

WEDNESDAY, June 23.—Gardeners' Royal Benevolent Institution, Festival Dinner at the Hotel Metropole.

SATURDAY, June 26.—Windsor Rose Show.

TUESDAY, June 29.—Southampton Rose Show; two days.

Brighton Rose Show; two days.

Canterbury Rose Show.

ANSWERS TO CORRESPONDENTS.

SWEET PEAS.—S. J., Hertford: Thin out the growths to about three per plant, and loosely secure those retained to the supports. It is a great mistake to allow a large number of growths to fill up the available room, and so crowd each other that good foliage and good blooms are impossible.

N.C.S. FLORAL COMMITTEE.—M. M. E., Donnybrook: The Floral Committee of the National Chrysanthemum Society consists of eighteen members exclusive of the officers of the society, who are members ex-officio. This body makes awards to varieties "that may be considered new, or which after a few years' culture may have developed unexpected high quality, or are not so sufficiently in commerce as to be generally known: and will consist of a First Class Certificate of Merit and a Commendation. Awards will be made by show of hands. A majority of at least three-fourths of the members of the committee present is necessary for the variety to obtain a First Class Certificate of Merit. Should it fail to obtain a certificate, a Commendation may be given to it provided it is supported by a three-fourths majority of those present. Exhibition, decorative, market, and all other varieties will be judged by the same standard. Votes of thanks and medals to collections of new varieties or meritorious exhibits will be awarded at the discretion of the committee."

PAMPAS GRASS.—A. M. W., Whitchurch: It is rather late in the season to remove and divide a large clump of pampas grass, but if everything is in readiness, and you can give extra care and attention in the matters of shading and watering, the work may be successfully done now.

ASPARAGUS BEDS.—R. N. G., Boston: A light dressing of nitrate of soda, about half an ounce to the square yard, finely broken up, applied after rain or a good watering, and then watered in, would assist the plants materially. When cutting ceases give the beds copious supplies of liquid manure, to encourage strong growth and plenty of foliage, because unless these are produced the prospects of a good crop of heads next year will be very poor.

SEEDLINGS OF ANEMONE JAPONICA.—B. H. G., Lincoln: Seeds of Anemone japonica very rarely ripen in this country, and so far as we remember there are only two home-raised seedlings, i.e., Lord Ardilaun and Lady Ardilaun, neither of which have the robustness of the type, though they are very beautiful. The variety Whirlwind came from America, and the double Coup d'Argent was raised in France. By a process of semi-starvation, in pots, and the use of a greenhouse, it might be possible to ripen seeds.

PLANTING OUT TOMATOES.—F. P. T., Rainham: If you have strong plants in 48 or 32 sized pots, each with one or two trusses of fruit set, then you may at once proceed to plant these out against south or south-west walls, or on sunny borders. Plant firmly and water in if necessary. Provide a stick for each plant in the border, and secure the other plants to the wall or to a stick placed close to the wall. Do not permit side growths to remain, but keep the plants to single stems, and take out the growing point when four or five trusses of fruits have set.

SIZES OF ROSE BOXES.—T. G., Westbury-on-Severn: We cannot do better than give the regulation of the National Rose Society with regard to boxes for exhibition roses. It is as follows:—All blooms exhibited (except where specially directed in the schedule to be shown in vases or otherwise) must be staged in boxes of the regulation size, viz., 4in. high in front and 18in. wide, and of the following lengths, all outside measurements: For 24 blooms, 3ft. 6in. long; for 18 blooms 2ft. 9in. long; for 12 blooms, 2ft. long; for 9 blooms, 1ft. 6in. long; and for 6 blooms, 1ft. long. In the above boxes for single blooms the tubes must be 5in. apart each way from centre to centre of the tubes.

LOGANBERRY.—D. G., Wolverhampton: Cut back the canes to within a few inches of the ground line; this will enable the plants to thoroughly establish themselves and make good canes for fruit production next season.

KAINIT AS A LAWN DRESSING.—G. W. P., Moreton: Kainit is an excellent lawn dressing but not for present application. If you mix 6lb. of kainit with 3lb. or 4lb. of basic slag, and distribute the mixture evenly over about 40 square yards of lawn in the autumn, the grass will have had a suitable dressing, and will profit materially from it. If this dressing is followed in the spring by a dressing of superphosphate at the rate of 4lb. per 40 square yards, it will be a decided advantage. Write us again in the autumn.

NAMES OF PLANTS.

J. H., Llandovery.—Alyssum saxatile.

S. E. J., Babbacombe.—Rhododendron Keysi.

M. C., Carnarvon.—1, Fraxinus Ornus; 2, Saxifraga Geum.

T. G. C., Chester. — 1, Begonia semperflorens gigantea; 2, Anguloa Clowesi; 3, Epidendrum vitellinum majus.

F. A., Worthing. — 1, Apparently a fine form of Asphodeline lutea; 2, Tiarella cordifolia; 3, Pulmonaria angustifolia.

F. L. W., Hull.—Cytisus biflorus; 2, Laburnum Adami; 3, Lupinus polyphyllus; 4, Phlox canadensis; 5, Daphne Cneorum.

H. P., Poole.—1, Gentiana acaulis; 2, Anchusa italica; 3, Æthionema coridifolium; 4, Lonicera etrusca; 5, Helonias bullata.

A. R., Norfolk.—1, Nephrodium Otaria, commonly grown in gardens as Lastraea aristatum; 2, Pellæa rotundifolia; 3, Polystichum aculeatum, a good form; 4, Cyrtomium falcatum; 5, Pteris tremula; 6, Asplenium bulbiferum; 7, Pteris longifolia; 8, Pteris cretica; 9, not recognised, send when in flower; 10, Curculigo recurvata.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WEED KILLER used once a year "No weeds can live." RICHARDS' ARSENATE OF LEAD for all leaf-eating insects. CUCASA (fungicide), the finest preparation of copper ever offered to gardeners. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Bunched Flowers at Exhibitions.

At the Temple Show the remark was made by more than one observer, that the old-fashioned system of displaying cut flowers in dense bunches was reasserting itself, a fact aggravated in many instances by the bunches being again so densely packed together that the individual grace and beauty of the flowers exhibited were entirely sacrificed. For some time past it has been a matter of congratulation that the methods of floral display in this connection have greatly improved, fewer blooms being used, and these arranged in such a fashion in vases and other fitting receptacles, as to permit of their natural beauty of habit and form being properly appreciated. Doubtless the exigencies of restricted space may be pleaded as some excuse at shows of the Temple description, but a glance at the offending exhibits is sufficient to show that the excuse is a poor one, dozens of flowers being employed where half, or even a quarter of the number would have served to much better advantage, while the choicest flowers in the collection were often difficult to discover amidst the crowd of mediocrities. Exhibitors, in short, in their anxiety to display their stocks, forget that quality and not quantity should be their watchword. It is only necessary to watch the passing stream of visitors to note how they stop and admire an exhibit which is judiciously and so artistically arranged on the few but choice principle, and, on the other hand, to note its unchecked and uninterested flow past a long array on market stall lines, a garish mass of chaotic colour wherein the individual beauty of its components is entirely lost. The trade exhibitors are naturally the greatest sinners in this respect, and many of them would do well to study the art of window dressing as exemplified in many of our high-class West End shops, wherein the fundamental idea is to display to the very best advantage, and in the most harmonious combinations, the "specialties" which they offer to the public. Nature, left to herself, abjures the "bunch" system: she may, and indeed does, create wonderfully beautiful mass effects, as we may see in the alpine sheets of aubrietias, arabis, etc., or on a larger scale in rhododendrons and azaleas, but if we examine these masses we find that every individual flower has its allotted space. In the process of growth there is a delicate adjustment of length of branch, stem, and stalk to attain the vital object that, at the critical period of the bursting and expanding of the floral buds, the insect world may have a fair and square view of the honey-bearing calyces, whose bright colours attract them for the purpose of fertilisation. The practised bouquetiste recognises this principle in her artistic arrangement of roses, lilies, orchids, or the thousand and one other flowers which, in these happy days for florists and flower lovers, are at her disposal; and it is this principle which the exhibitors of cut flowers at our shows should adopt and adhere to to the utmost, deleting a very large percentage indeed in favour of the balance. Flowering plants and decorative foliage plants are not so much handicapped, but even with these there is room for improvement as regards spacing and arrangement, and it was remarked at the Temple that, in view of the restricted space, it was hardly fair that many square yards should be devoted to mass displays of hundreds of practically the same strain of plants, despite of the fine effect due to judicious arrangement. We are glad to note that the Council of the R.H.S., in connection with the forthcoming Holland House Show, specially request that all groups should be less crowded, and that masses of colour should be broken up by the use of green foliage. It would be far better if exhibitors would be content to show less and confine it to the best of their produce only, and it is to be hoped that this will be taken to heart and acted upon. If not, it would have a very salutary effect if the group committee of judges would make a note of the offenders for consideration later, when the allotment of space for future exhibitions is under consideration. An award of demerit now and again would not be out of place, and is only too often deserved.

MR. G. FORREST.
A Celebrated Collector of Chinese Plants.

Mr. George Forrest.—Among the band of intrepid travellers who have risked their lives and encountered many difficulties to enrich our gardens and plant houses Mr. George Forrest must take a prominent position. It was in 1904, on the recommendation of Professor J. Bayley Balfour, that Mr. Forrest, then at the Royal Botanic Gardens, Edinburgh, was engaged by Mr. Bulley (of Bees, Lim.), to explore the higher plateaux and mountain ranges of N.W. Yunnan and S.E. Tibet for the purpose of collecting new and rare alpines. During his three years' service he made several journeys into Tibetan territory, and found the flora even richer than had hitherto been supposed. For some time he collected on the high ranges to the west and north of Talifu, covering most of the hunting ground of the famous Père Delavay, and, besides securing many new species, obtained seed of a number of the gems of the natural orders, ranunculaceæ, primulaceæ, saxifragaceæ, ericaceæ, etc., contained in his collections. A few of these are now being placed before the horticultural world, but by far the greater number, and finer species, have yet to appear. North and west of Talifu he found the country extremely difficult of negotiation, consisting of a mass of huge parallel ranges, the watersheds of the Salwin, Mekong, and Yangtze rivers. Besides the natural difficulties of the country, he had continuously to overcome more or less active hostility on the part of the Chinese officials, and the lamas, who, for their own purposes, oppose, so far as lies in their power, the entrance of any European, for any object whatsoever, to the country under their jurisdiction. In the summer of 1905, on his second journey to the mountains of the Salwin-Mekong divide, in lat. 28°-29° N., Mr. Forrest narrowly escaped with his life. The lama world had been greatly disturbed by the Younghusband mission to Lhassa; also at the time there happened to be great friction between the local Chinese authorities and the lamas of Batang and the Upper Mekong, with the result that the whole country was incited to revolt by the lamas. At that time Mr. Forrest was working the district north-west of Tsekou, on the Mekong-Salwin divide, a station of the French Roman Catholic Tibetan Mission, having made that place his base. After several months of weary anxiety and suspense he was finally surrounded by a band of some 7,000 to 8,000 armed lamas and Tibetan soldiers. The mission house was utterly destroyed, the two missionaries of the station being captured, and, after three days' frightful torture and mutilation, brutally murdered. Most of the native Christians, converts of the missionaries, were killed or carried into captivity, and of seventeen collectors and servants in Mr. Forrest's employ, sixteen lost their lives. After exceptional hardship he escaped, but lost the result of four months' hard work, results which would undoubtedly have astonished botanical and horticultural circles. In the following year Mr. Forrest attempted to penetrate the same region, but was prohibited doing so by the Chinese authorities, and had, temporarily, to abandon the project. Nevertheless, the results have been excellent, and no one, except those who have traversed the country, can conceive of the richness of the flora, the bulk of it composed of those orders which are of the greatest value for horticultural purposes. Later on Mr. Forrest made a journey up the valley of the Salwin, north from Tengyueh, covering nearly 100 miles of unexplored country, but, the greater part of this valley being tropical or sub-tropical in its climate, the journey was most unproductive.

Gardens around Dublin.—As briefly announced in our issue of the 5th inst., we shall give a fully illustrated account of some of the more important of the great gardening establishments in and around Dublin in the issues of the Gardeners' Magazine for the 19th and 26th inst. Among the private establishments that will be illustrated and described are Powerscourt, Kilruddery, Carton, and Straffan House; and the public gardens will include Glasnevin Botanical Gardens and the People's Garden, Phœnix Park.

Unseasonable Weather. During the past fortnight the character of the British climate for extreme variability has been amply vindicated. A fortnight since the temperature was so abnormally high that if it did not establish a record, it has only been exceeded in May twice during the past thirty-eight years. A week ago, for a like period of three days, the temperature was so low that on the 4th and 6th inst. the maximum reading was only 52 degrees, or 32 degrees below the maximum temperature recorded during the warm period a week previous. During the past thirty-eight years there have been only five days in June when the maximum temperature has been equally low, and two only in which the maximum has been lower, the lowest having been in 1903. when, on June 19, the maximum was 50 degrees. The week ending June 6 was remarkable also for the small amount of bright sunshine, none having been recorded at Westminster on the last four days. A period of cold wet weather is by no means exceptional in the early part of June, especially between the 3rd and 7th of the month.

Honour to Mr. R. Wilson Ker.—We have much pleasure in announcing that on Tuesday last the council of the Royal Horticultural Society conferred the honour of the Victoria Medal of Honour upon Mr. R. Wilson Ker, of Liverpool. This well-known horticulturist has accomplished such splendid work in the cause of gardeners and gardening that the pleasure we feel will be shared by all who are acquainted with what he has accomplished.

Jubilee of R.H.S. Committees.—The value of the standing committees in the conduct of the work of the Royal Horticultural Society is admirably exemplified by two interesting facts. One is the long period that has elapsed since two of the committees were established, and the other the continuity of all the committees, there not having been a break in the work of any one of them. The Fruit Committee was established in 1858, and the Floral Committee in 1859, and consequently one attained its jubilee in 1908, and the other completes its half-century of activity this year. To fittingly mark this important event in the history of these two committees the council will entertain the members at dinner at the Hotel Windsor on the evening of July 7, the second day of the Holland House Show.

York Floral Fete and Gala.—We would remind our readers that this great horticultural gathering will be held on Wednesday next and two following days; and mention that the exhibition has, we understand, the promise of proving one of the best that has yet been held in York. We shall give a full report in our next issue.

Mr. Charles Foster has received the distinction of being admitted, honoris causa, as an Associate of the University College, Reading. The associateship was conferred by the Principal (Mr. W. M. Childs, M.A.), at the recent annual reunion of old students in the college hall. Mr. Childs said they admitted with much pleasure Mr. Foster as an Associate of the college, but the pleasure was mingled with regret because he was leaving them to take up a very important appointment elsewhere. It was six years since Mr. Foster came to take a most important charge in relation to the department of horticulture, and no one had contributed more than he had done by his practical knowledge, remarkable skill, and incessant perseverance to the growth of that horticultural work to its present high state of efficiency. They all wished him success in the new field of effort upon which he was entering.

Visit to East Burnham Park.—With their usual generosity Mr. and Mrs. Harry J. Veitch have invited the members of the standing committees of the Royal Horticultural Society to East Burnham Park on Thursday, July 1. We are quite sure that all who possibly can will avail themselves of this invitation to "play a friendly game of cricket" and inspect the treasures of Mr. and Mrs. Veitch's garden and home.

Harry Veitch Portrait Fund.—We have received from the honorary secretaries to the fund that is being raised for the purpose of obtaining a portrait of Mr. Harry Veitch, V.M.H., painted by an artist of the highest eminence, a list of the names of those who have sent in their subscriptions or signified their intention of subscribing. This list contains over one hundred and sixty names, and is of much interest as further evidence of the high estimation in which Mr. Veitch is held, and the readiness with which all classes of horticulturists have co-operated in raising the fund necessary. We are asked to state that others who may be desirous of co-operating are requested to intimate their intention at once, as the list must be closed in a few days' time. It is hoped the fund may allow of sending a photogravure to every subscriber of £1 1s. and upwards. Cheques should be made payable to either Mr. H. B. May, Stanmore, Chingford, or to the Rev. W. Wilks, treasurer, Shirley Vicarage.

Orchid Committee Outing.—At the meeting of the Royal Horticultural Society's Orchid Committee, on Tuesday last, Mr. Charlesworth, through the chairman, Mr. J. Gurney Fowler, invited the members of the committee to visit his new orchid establishment at Haywards Heath, on Friday, June 25. Mr. Charlesworth, who has long been a prominent member of the committee, said that he wished the members to assemble at the Royal Horticultural Hall on June 25, and he would provide motor cars for their conveyance to the Haywards Heath nurseries, and back again to town.

Finsbury Square.—The leases of the houses surrounding Finsbury Square are in the point of falling in, and when the time comes for their surrender a great development scheme will be proceeded with by the Ecclesiastical Commissioners. In the meantime it is proposed, if the sanction of the residents can be obtained, to throw open to the public the small, but beautiful garden now exclusively reserved for the enjoyment of the householders.

Taxation of Open Spaces.—At the monthly meeting of the Metropolitan Public Gardens Association attention was drawn to the proposals in the Finance Bill for taxation of land, and it was agreed to make representations to the Chancellor of the Exchequer with a view of securing the exemption of all areas in or near towns used as parks, gardens, playing fields, and the like, which, although in private hands, are valuable air spaces, and in many other ways add so much to the amenities of town life.

Nature Study Exhibition.—An exhibition was held by the Nature Study Society in the gardens of the Royal Botanic Society on the 4th and 5th inst. The exhibition was thoroughly representative and of much interest. On the second day a lecture on "The Romance of Forest Life" was delivered by Mr. Martin Duncan. The lecture was devoted to observations made in the New Forest, and at the commencement Mr. Duncan showed on the screen a series of beautiful views taken within its boundaries. Passing on to describe the bird and animal life to be found in the forest, he touched upon the habits of owls, bats, which came out while he was engaged in trying to photograph the owls by flashlight, the toad, the mole, and British snakes. Mr. Duncan, in concluding his remarks, expressed his warm approval of the scheme now on foot to have the New Forest kept as a naturalists' reserve.

Manures for Potatoes.—The conclusions of Messrs. Porter and Gaut, from the experiments conducted by them for the Lancashire County Council, are to the effect that a heavy dressing (20 tons per statute acre) of farmyard manure results in a smaller return per ton of manure used than is the case with a moderate dressing (10 tons) of farmyard manure. A moderate dressing of the latter, in conjunction with a suitable dressing of artificial manures, is capable of producing a larger and a more profitable crop than a heavy dressing of farmyard manure alone. A "complete" dressing of artificial manures—i.e., containing the three constituents, nitrogen, phosphates, and potash in conjunction with farmyard manure, gives the largest crop and the highest profit per statute acre. The doubling in turn of each of the constituents in the "complete" dressing does not result in a satisfactory profit, and may, in some cases, result in a heavy loss. Where no farmyard manure is obtainable, large and profitable crops can be grown with the aid of a "complete" dressing of artificial manures.

Hanley Horticultural Fete is a municipal affair, and has now grown to be one of the largest and most comprehensive of the several horticultural exhibitions held in the Midlands. The fête is held in Hanley Park, close to Stoke-on-Trent Station, and this year the date fixed is July 7 and 8. In the new schedule we find that a fine silver challenge cup is presented for the best trade display. The total value of the prizes for a group of plants arranged for effect is £85 9s.; and for a group of orchids £30, with a silver challenge cup added to the first prize. Very liberal prizes are offered for roses in the eleven open classes, and sweet peas are well catered for. A decorated dessert table class forms the chief item in the fruit and vegetable section, and the premier award is £10 10s., and a special prize of the value of £3 3s.; for a collection of twelve dishes of fruits the total prizes offered amount to £21, with £3 added for prizes for decorative arrangement. Prizes for vegetables are chiefly provided by seedsmen. There are, altogether, ninety-nine classes provided, and a copy of the schedule can be obtained on application to Mr. William Poulson, Town Hall, Hanley.

Bacteria and Non-leguminous Plants.—To a recent meeting of the Royal Society Professor W. B. Bottomley contributed a paper on the effects of nitrogen-fixing bacteria on non-leguminous plants. It was stated, in the course of the paper, that bacterial cultures prepared from the algal zone of cycas tubercles taken from below the surface of the soil always contain a species of azotobacter associated with Pseudomonas radicicola. Pure cultures of these organisms were obtained, and it was found that when they are growing in association there is an increased assimilation of free nitrogen. In cycas tubercles the bacteria live, usually imbedded in a slime, in the open spaces of the algal zone, and the projecting cortical cells presumably absorb the nitrogenous products of bacterial activity. Experiments made to ascertain to what extent, if any, a mixed culture of pseudomonas and azotobacter applied to the roots of other non-leguminous plants might influence their growth, the nitrogenous bacterial products being absorbed directly by the plant, gave the following results: Pot experiments with oats grown in sand dressed with phosphates, potash, and lime. Treated pots watered with the mixed-culture solution gave an increase of 76 per cent. Field experiments with barley on limed plots of 484 square yards. Seed only treated with bacterial culture. Yield per plot: Untreated, 608lb.; treated, 691lb.; increase, 83lb. Galtonia candicans grown in sandy soil, manured and limed, 250 bulbs of equal size in each bed. Weight of bulbs when lifted and dried at end of season: Untreated, 69lb. 3oz.; treated, 82lb. 1½oz.; increase, 12lb. 14½oz. Parsnips, grown in garden soil, manured and limed. Untreated, 68 roots weighed 22lb. 14oz.; average per root=5.38oz.; treated, 65 roots weighed 26lb. 10oz., average per root, 6.55oz.; increase per root, 1.17oz.=21.7 per cent. In all the experiments the soil was treated with lime before the mixed culture was applied.

Kirtlington Park, the seat of Sir George J. E. Dashwood, has been purchased by Lord Leven and Melville. The Kirtlington Park estate extends over several thousand acres, and is of considerable historical interest. It appears to have been for a long period a demesne of the Sovereign, and in 1420 it passed to Henry V. The mansion, erected in 1746, stands in a finely-wooded park of about 700 acres, and contains some fine carvings by Grinling Gibbons.

Removing Leaves from Transplanted Roses.—The National Rose Society's "Annual" for the current year contains a note from Mr. O. G. Orpen on the removal of leaves from rose trees transplanted early in the autumn, for the purpose of reducing the evaporative surface. The matter is of interest to fruit growers as well as rosarians, and we herewith reproduce the note: "For several years, when moving roses in the autumn which were in active growth, I have made it a practice to remove the foliage, and, I believe, in each case with good results. The difference between plants so treated this last trying autumn, and those on which the foliage had been left, is so marked that I feel I may venture to draw attention to it in a short note. I do not for a moment suggest that there is anything novel in this procedure, and there may be something to be said against it, but I should like some of those amateurs who have never tried it to do so with a few plants next autumn. Teas and hybrid teas are generally in more active growth at transplanting time than hybrid perpetuals, and when such are lifted in bright or drying weather, and all the foliage left on, even though they may be replanted at once under favourable conditions, they soon look very sorry objects. And this, I think, is not to be wondered at when it is remembered what a mutilation of the roots has, in the majority of cases, taken place. It means at least the loss of those small roots and root hairs by means of which the plant draws from the soil the water it constantly requires to meet the drain caused by the evaporation from its young shoots and leaves. The water which the roots absorb fills up and distends the many vessels in the stems and leaves, and, if this supply is suddenly cut off, and there is no reduction of the surface from which water is transpired, not withered leaves only, but (much worse still) withered and shrunken stems must be the result. To-day (January 9) I have examined the roots of some defoliated dwarfs, planted in November, and I find they have started rooting in a most satisfactory manner, while the stems are plump and sound, very different from those planted at the same time and not so treated. I am aware that it is now held that the aerial parts of plants absorb moisture, but this can be only under favourable conditions, and even then the transpiration from the leaves—if many—must be greater than the combined supply from this source and through the damaged roots."

VARIATION.

By those who merely study the subject of variation in animals and plants in a general and more or less superficial way, it is regarded as an exceptional phenomenon, by which now and again the selective breeder or cultivator is able to profit either by obtaining new types or enhancing the character of older ones. Those, on the other hand, who study the minutiæ of organic life, recognise it as universally prevalent, and it is probably quite safe to say that no two natural creations are such exact replicas of each other in all respects as to be entirely indistinguishable. This seems a very daring thing to assert when we consider the infinite myriads of organisms which exist, from the huge to the microscopic; but we must remember that minute size in this connection by no means implies simplicity of type, such as would preclude variety of character, since even the organic germs which defy definition by the highest power of our microscopes are built up of an incalculable number of molecules, so that the chance of an arrangement on precisely the same lines is not only infinitesimal but practically non-existent.

How much more, then, is this the case when the organism is large and of obviously complex character, where myriads of millions of cells are aggregated and differentiated to perform various functions and build up varied organs for varied purposes. Clearly the chance of exact agreement in any two individuals is decreased in precise proportion to such complexity, and the wonder would be, not that a difference should be observed, but that an identity should occur. Thus, if we take a packet of seeds, and examine them individually, with a lens if need be, we shall speedily perceive the existence of differences; and if we continue our research, we shall soon become convinced that no two are likely to match each other precisely. Scatter such seed, say mustard seed, on a flat soil surface, and when they germinate examine the young plants, and again, no two will start active growth in precisely the same way, both roots and cotyledons will differ, and, although the initial differences will be largely determined by the relative positions of the germinal point and the soil, so that in some cases the protruded rootlet may have a straight course downwards and in others may have to twist over, the cotyledons being affected in like fashion, but on reversed lines, we should find that this is only one factor in the variety observed, and that were this avoided by careful adjustment of the germinal point downwards, there would still appear an individuality in every youngster, even in the infantile two-leaved stage.

Despite, however, this innate capacity of differing individually, the tendency of each individual is to adhere to a more or less definite family type; as a rule, it inherits that tendency strongly enough to ensure that in general character it will resemble both the parental form and also that of its immediate relatives, so that an immense number of individuals, forming a species, may be identical in the general characters they display, the only variation being in the details of their make, largely determined by the nature of their particular environments. Thus they may be stunted or robust, according to their subjection to uncongenial or congenial conditions of growth; but it is a very open question whether long exposure to opposite conditions would lead to the differentiation into two types to suit them without a capacity surviving in each type of resuming its old form in its old environment, unless variation of another class, viz., "sporting" or mutation, has come in as a factor. In dealing with this class of variation, we are brought into contact with one of the most puzzling biological problems, since it differs extremely from that mere individual variation of which we have treated both in degree and in character.

Every organism and every part of that organism originates with a single cell, and in this cell, as a rule, there is an inherited tendency to multiply itself on definite lines, and form definite structures on purely parental lines, and assuming the parents to belong to one and the same species, the usual result is the reproduction of the parental form, a process which goes on from generation to generation, it may be for ages, and which thus perpetuates the existence of a species. With "sports," or "mutations," however, forming the second category of variation, this continuity of type is suddenly broken, the mother cell of a seed, or one produced by a spore, either of its own initiative, so to speak, or inspired by a modified pollen cell, or antherozoid, it is immaterial which, or it may be, an inspired asexual mother cell of a bud, throws off the parental impulse to proceed on the old lines, and in some subtle fashion conceives and carries out a new plan embracing, it is true, the general generic characters, but involving more or less marked modifications of structure, colour, or other characters, of which there may have been no obvious trace at all in the parents. More than this, and herein lies one of the salient differences between mere individual variation and mutational variation, these new characters are so thoroughly impressed upon the organism that they are reproduced in the offspring, generally truly, but sometimes in varied degrees, less and greater, the latter of which are naturally the selective cultivator's opportunities.

There is abundant evidence to prove that these sudden departures from the normal type and assumption of a new one are, as a rule, purely spontaneous, in the sense that they are not induced by hybridisation or any recognisable external factor. That hybridisation is not in question is proved by the fact that a large number of natural fern sports have originated in solitary indigenous species, while no species known possessed the new characters as specific types. That change of environment or peculiar conditions are not incentives to mutation, is evidenced by the fact that the abnormal plants are found sometimes so closely associated with normal ones of the same species, that the roots have to be disentangled from each other. Until recent years these "sports," or "mutations," were regarded as of no scientific importance, the botanist condemned them as "monstrosities," classing them apparently with "freaks" of the Barnum description, regardless of the fact that, unlike those deformities, they were not only often very beautiful, but since they reproduced themselves truly from their spores or seeds, they fulfilled all the practical conditions of new species.

Lately, however, quite other views have prevailed. Some five-and-twenty years ago the writer, having taken up the study of variation in our native ferns, advocated the view that much might be learnt by the scientific study of the phenomena presented, and, as it happened that about that time certain discoveries were made in that particular connection which justified that view, a long series of monographs and papers from some of our most eminent botanists have been published by the Royal Society and the Linnean Society, which have revolutionised the previous ideas and established many quite unexpected biological facts. Furthermore, Professor Hugo de Vries, in his "Theory of Mutation," has strongly advocated the view that these sudden "sports" may have played a material rôle in the evolution of species, a view now shared by many. The great enigma, however, of "What induces mutation?" still remains unsolved. It is comprehensible that plants should widely vary when alien potencies are introduced by hybridisation, but it is quite another thing when a cell, as we have described, apparently spontaneously adopts a new plan, and, to all intents and purposes, a "special creation" results, for which evolution on the old theoretic gradational lines, has no place at all. Thus, "Natura non facit saltum." can certainly no longer be maintained.

Chas. T. Druery, V.M.H., F.L.S.

THE LOCUSTS OR FALSE ACACIAS.

(Concluded from page 437.)

◆

The Best Species and Varieties.

R. neo-mexicana.—This is a little known but highly ornamental tree of vigorous habit, and very like the larger-growing forms of the Common Locust when not in flower. The leaves are from 6in. to 12in. long and of a fresh green hue, even at the end of summer. The flowers are rose-coloured, and borne in dense racemes, four inches or so long, in June, a further crop of blossoms appearing on the secondary growths in August. It is found on the eastern slopes of the Rocky Mountains, and extends from S. Colorado to New Mexico, South Utah, and Arizona, at elevations varying from 4,000 to 7,000ft. Several specimens are to be seen growing at Kew, at which establishment the first specimens were received 22 years ago.

R. pseudacacia.—The Common Locust is widely distributed in all the Western States, and is said to attain the largest dimensions in Kentucky and Tennessee, where, in good soil, it attains a height of 80ft., with a trunk diameter of 4ft. Its value as a specimen and street tree is well known in our southern counties, but it is not used to so great an extent in the north. The dainty pinnate leaves have always a fresh appearance, whilst the drooping racemes of fragrant white flowers are particularly pleasing in June. An old tree often presents a very picturesque appearance, the trunk being deeply furrowed and the bark rough and rugged, whilst the branches are frequently curiously twisted. It is not, however, the type that requires attention here, so much as the varieties, of which there are very many. In very few gardens would a full collection be desirable, and a limited selection of the best is appended

R. p. Decaisneana.—A distinct variety, which produces larger leaves than the type and fine racemes of pink flowers. It is a very vigorous grower, and a form called flore-rubro, with deeper coloured flowers, is also an excellent tree.

R. p. fastigiata.—This forms a distinct break from all other varieties, its habit being similar to that of the Lombardy poplar. Like other fastigiate habited trees it is very useful to plant as a relief amongst those with round heads.

R. p. aurea.—Where a break of colour is required in the garden, this variety may be used, for the leaves, which in other respects are similar to those of the type, are of a pretty golden hue.

R. p. inermis.—A spineless variety of slow growth, often used, grafted on tall stems, to form mop-headed specimens for small gardens. It stands cutting back well.

R. p. Rehderi.—This is a dwarf variety of slow growth, forming a miniature tree, ranging in height from a few feet to 15ft.

R. p. monophylla.—The chief characteristic about this is, that the number of leaflets is greatly reduced, whilst those which are borne are of large size. Sometimes but one leaflet appears, at others three, and sometimes an indefinite number, but never many. It is a very effective variety, and generally admired. There is a form with similar leaves, but with secondary branches of a pendulous character; if anything, it is the more desirable of the two. This is also a form with a fastigiate habit.

R. p. robusta Vignei.—This variety is conspicuous amongst others by reason of the peculiar lightness and grace of its elegant foliage. The leaves are as long as those of the type, but neater and more delicate. It forms an excellent lawn tree.

R. p. bella rosea.—One of the better-known varieties, which bears rose-coloured flowers freely.

R. p. tortuosa.—In this variety the branches are somewhat twisted and contorted, the same remarks applying to the leaves. It is very distinct amongst others.

Some 40 other varieties are known, but those described will be found a distinct set.

R. viscosa.—Under the name of "Clammy Locust," this species was introduced from Georgia and Carolina, where it inhabits the sides of mountain streams. It forms a tree 20 to 40ft. high, peculiar, by reason of its viscid branches and curiously burred trunk. The flowers are rose-coloured, and borne in short, dense, upright racemes, and are not fragrant like those of the former species.

R. Kelseyi.—Sufficient time has not elapsed since the introduction of this species to know to what height it will grow in this country, though it looks as if it will form a small tree. The leaves are made up of eleven or occasionally more leaflets one to one and a-half inches long, and barely half an inch wide, terminated with a stiff, hair-like point. The flowers are rose coloured, and intermediate in size between those of R. pseudacacia and R. hispida. The flowering period is June, and the flowers are followed by fruits three inches or so long, thickly covered with stiff reddish-brown hairs. It is found in the Southern States.

R. hispida.—This concludes the species in cultivation. It is the rose acacia of the Southern United States, and forms a straggling bush rather than a small tree, and, as it suckers freely, a thicket of branches is formed. The branches are long and brittle, and are thickly clothed, especially on the young wood, with brownish spines or stiff hairs. The leaves are pinnate, eight to twelve inches in length, with large leaflets. The flowers are rose coloured, about the size of those of a culinary pea, and borne four to six together in loose racemes. Under cultivation it has not been known to fruit, and even in a wild state fruits have rarely been found. There is a variety known as inermis, which is a great improvement on the type, and should always be planted in preference to R. hispida. It can be recognised by means of its spineless branches and denser racemes of larger flowers

W. Dallimore

USEFUL GUIDE TO GARDEN WORK.—A handy all-round guide to work in the garden month by month is the Gardening Year Book, by George Gordon, V.M.H., price 1s. net from booksellers, [illegible] 1s. 3d., from W. H. and L. Collingridge, [illegible] gate Street, London. The book is freely [illegible] and the cultural details thoroughly pra[illegible] up to date.

WISTARIA MULTIJUGA ALBA.

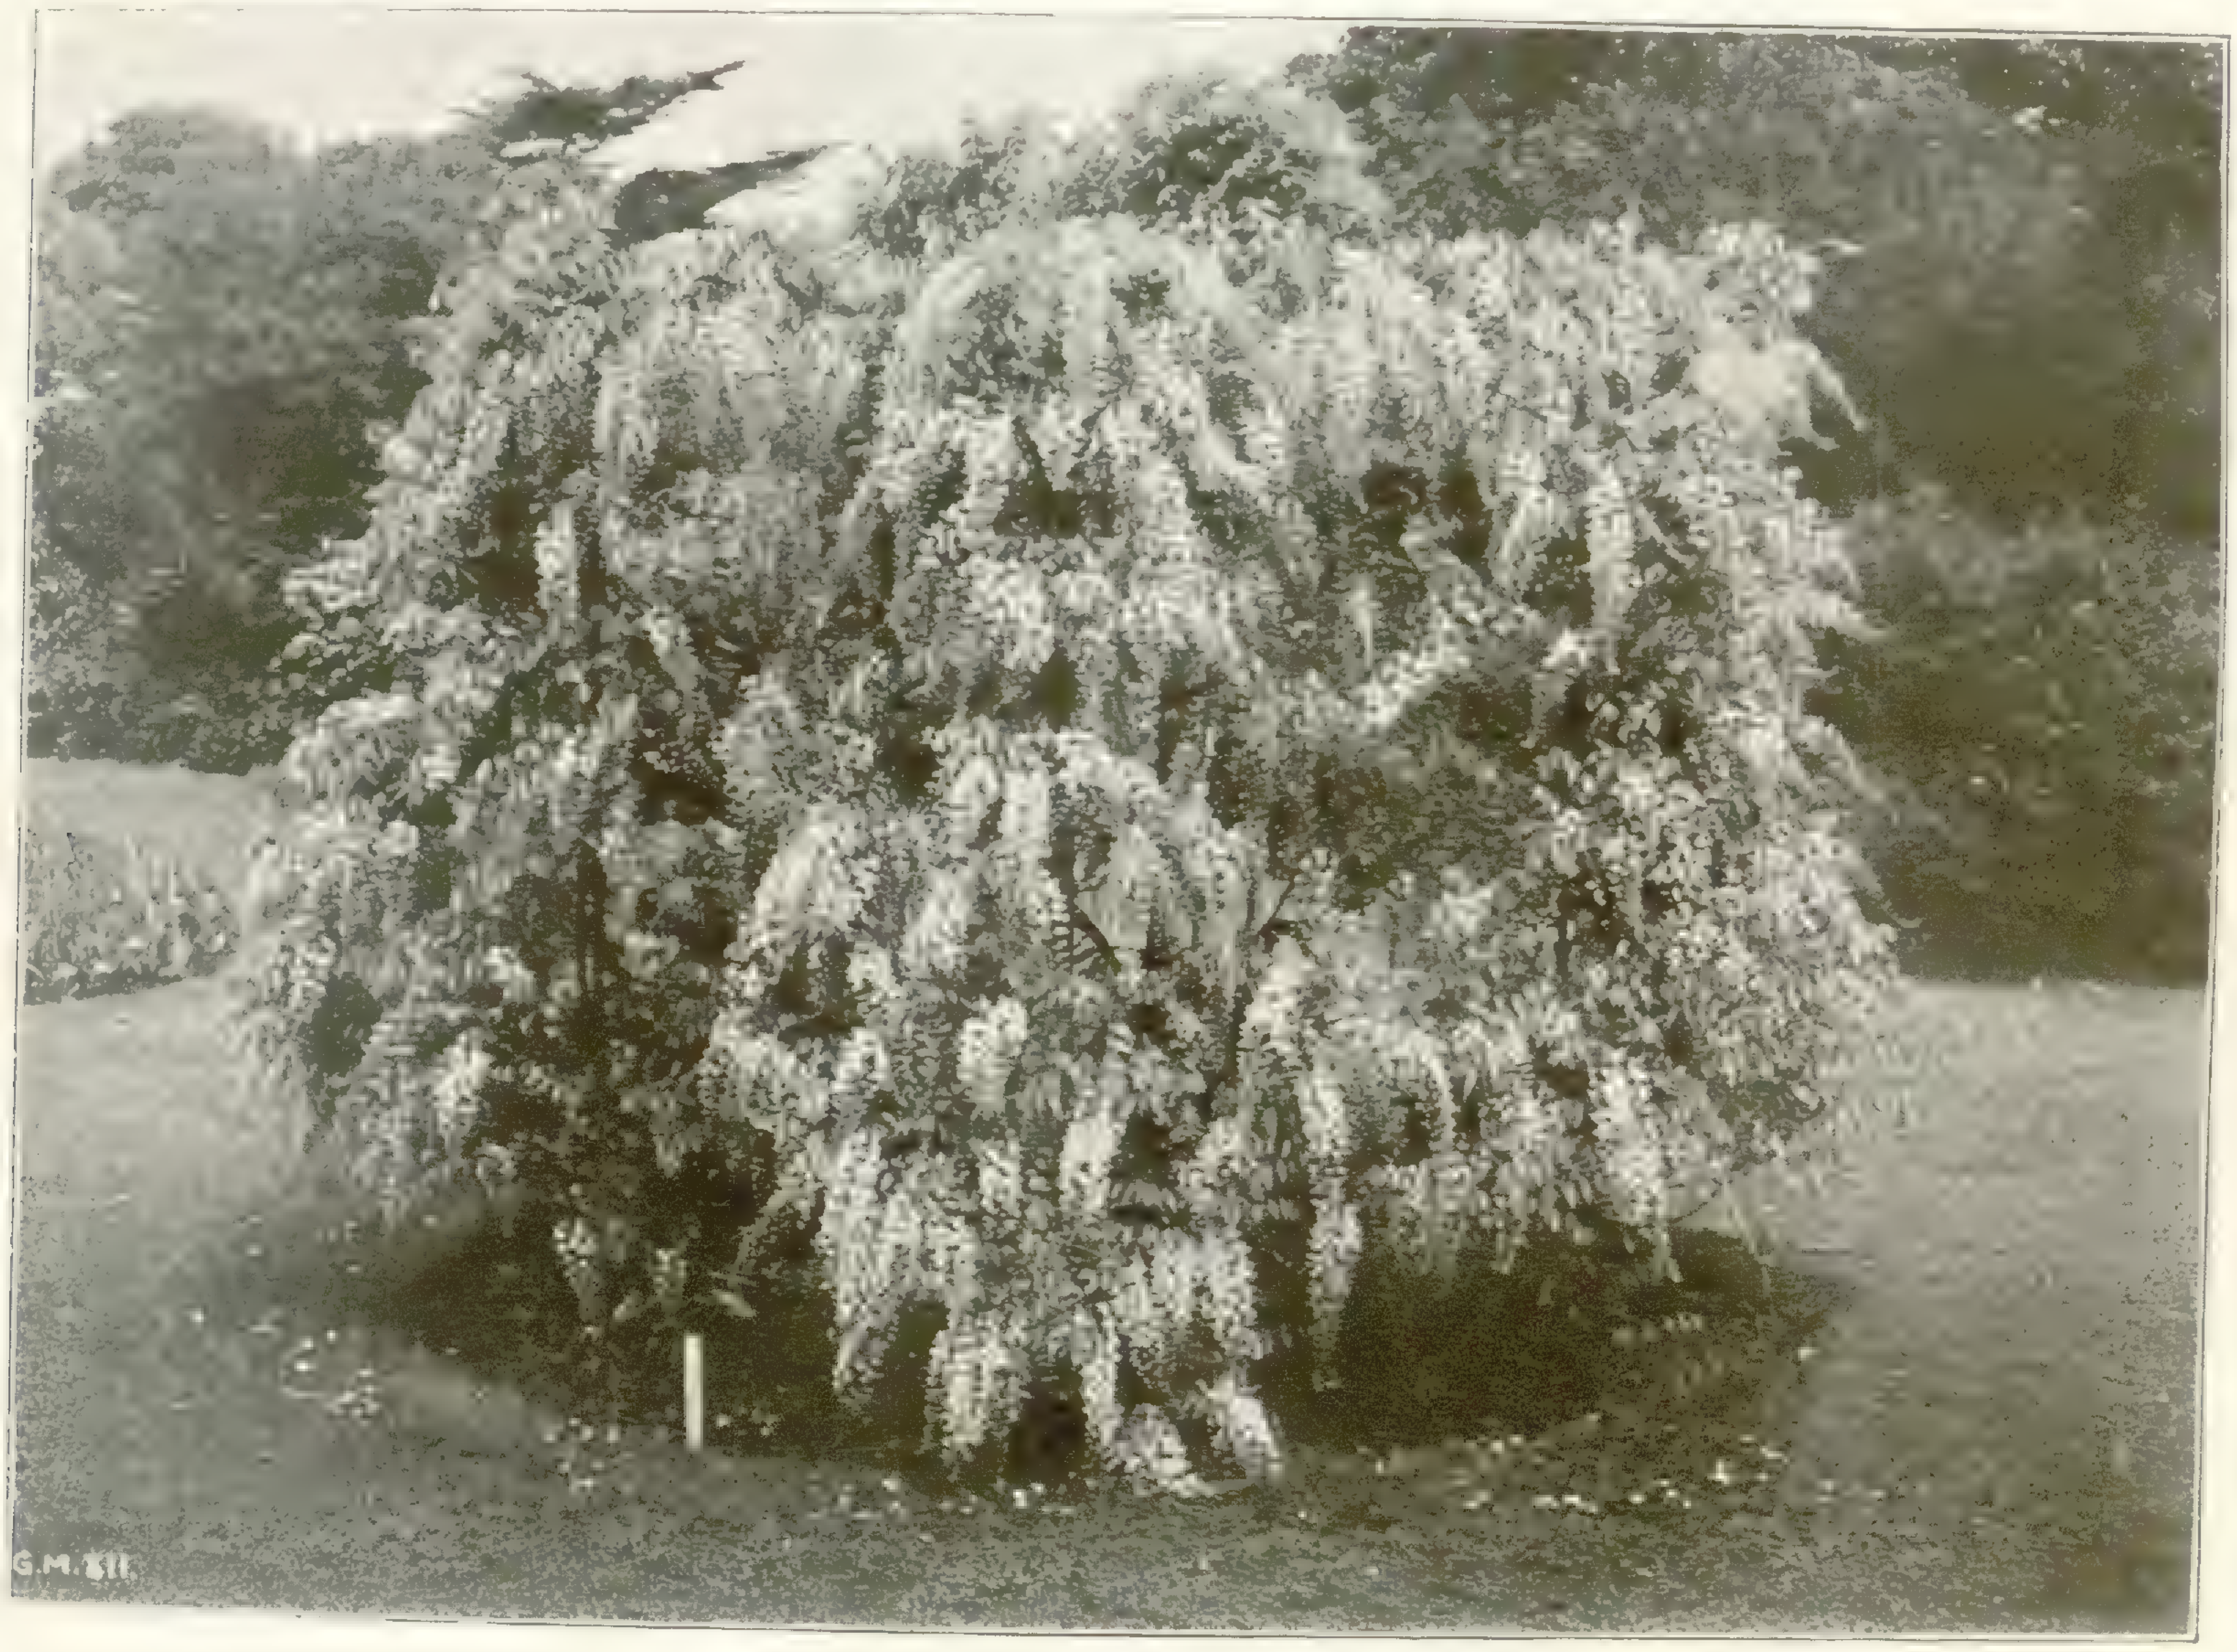
The typical form of the Chinese wistaria (W. chinensis) is one of the most popular of hardy climbers, and, as the result of the favour with which it is regarded by flower lovers of all classes, it is well represented in many thousands of gardens, and contributes liberally to their attractions during the season of flowering, which usually commences before May is far advanced. This naturally affords one much gratification, for, while one of the most beautiful of the hardy plants of scandent habit, the Chinese wistaria can be successfully grown without any serious difficulties having to be surmounted. Reference is made to the Chinese species because it has enjoyed a high degree of popularity from its first appearance in this country nearly a century ago, while its Japanese relative (W. multijuga), introduced thirty-five years since, has received but little attention from the general body of garden lovers. Why this Japanese species should not have been regarded with much favour is not easy to understand. It has two strong points that should appeal to the planter, and of these, one is its surpassing beauty, and the other its adaptability to a very simple course of culture. It might be suggested that the books published of late years have not dealt so generously with this fine climber as they might have done, and that the authors of some have not been particularly successful in showing a thorough acquaintance with its characteristics.

This species has been described as not particularly free in blooming, but the evidence in support of the description is certainly not conclusive. We have only to refer to the many illustrations of Japanese gardens that have been published in this country during the past twenty years for proof that this wistaria is prodigal in the production of its flowers when at home. It does not, of course, necessarily follow that because a plant blooms freely at home it will do so in a foreign land, but there is ample proof that in this country, provided the conditions are favourable, W. multijuga will annually bloom with remarkable freedom. It certainly flowers freely enough at Kew, and there must be many thousands of gardens in England where it might be grown with a similar degree of success. This is the species so largely utilised in Japan for training over the tea-houses, on trellises and other supports, both in public resorts and in private gardens, and the flowers which, individually, are smaller than those of W. chinensis, are borne in racemes, ranging from eighteen to twenty inches in length. The colour is an exquisite shade of purple-lilac, and the crowds of elegant racemes produce a delightful effect.

Not less desirable than the typical form is W. multijuga alba, which, as indicated by its varietal designation, has white flowers. The freedom with which the long and elegant racemes are produced is well shown in the illustration given herewith of the fine specimen that at the present time constitutes one of the most attractive of the many good features of the Royal Gardens, Kew. The effect would, perhaps, have been more striking had the photographing of the specimen been delayed until the whole of the flowers had been fully developed, but I have been anxious to call prominent attention to the specimen while there is an opportunity for seeing it in the full flush of its beauty.

The specimen, which is formed by five or more plants, that were put in their present position five or six years ago, is about seven feet in height, and has a diameter of about nine feet. The growths are supported by four stout stakes placed at equal distances apart round the circumference of the bed, and one in the centre, and braced together at the top and bottom. The typical form is trained to the central support, and the lilac-purple flowers present a pleasing contrast to those of the white form. The specimen occupies a position on the north side of the gardens and within a short distance of the new water garden. The large circular bed near the tropical lily house that for some years was occupied by Carmine Pillar rose, is now devoted to the typical W. multijuga and its white variety, and, as the framework is considerably higher, the effect should be even better than that produced by the specimen illustrated, when the plants fill their allotted space.

G. G.



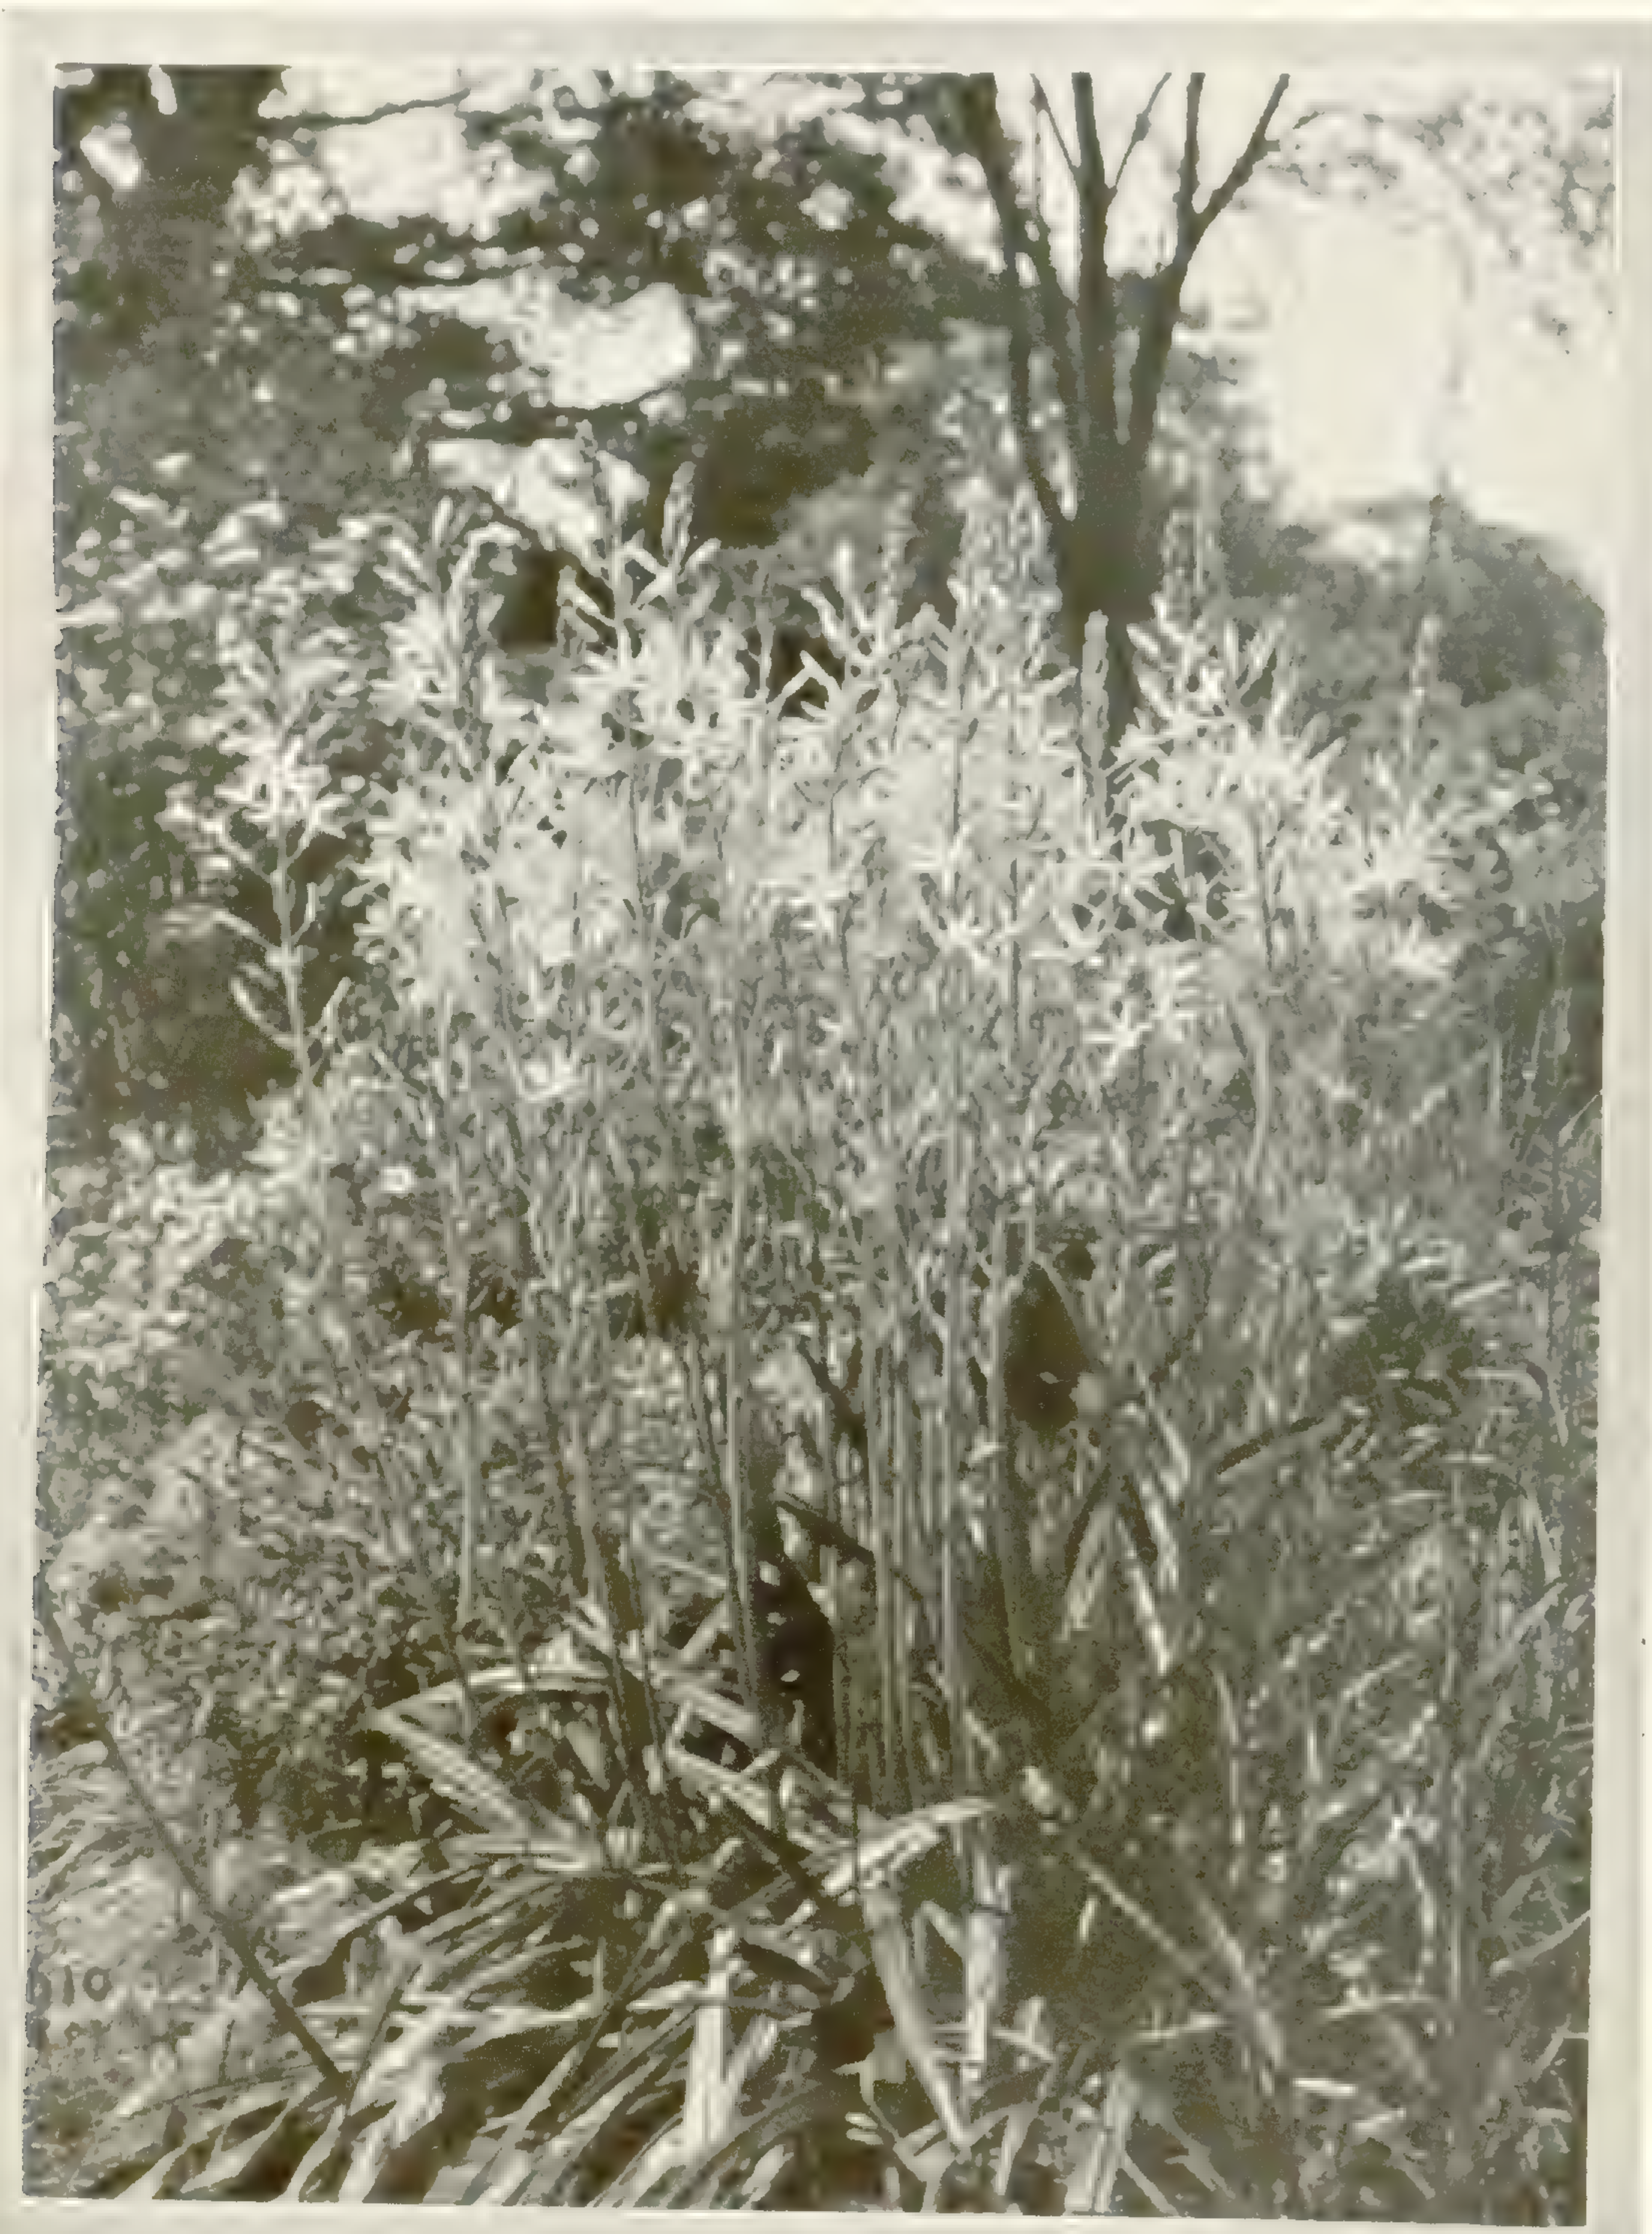
WISTARIA MULTIJUGA ALBA.
A remarkably fine specimen of this beautiful pure white hardy climber in the Royal Gardens, Kew.

Dimorphotheca aurantiaca.—Closer acquaintance with this plant deepens the conviction that it will become a most popular plant. Its beauty goes without question, but to the gardener its robust, free-growing qualities will most directly appeal. It germinates freely indoors in early spring, and is never capricious about damping off. From seed box to pot it transplants with perfect ease, and it is never in two minds as to growing. I planted my first batch outdoors in April (before Easter), at the foot of a south wall, and on May 5, the first flowers were fully expanded, imparting a rich colour to the spring garden, and a most welcome addition to the plants for adorning gardens in the open-air during summer. It is also a beautiful subject for growing in pots in an amateur's greenhouse, and to those whose facilities are limited in this direction I can recommend it as one of the easiest plants to flower. Seed sown at intervals from the beginning of February will give plants to flower from April throughout summer.—Thomas Smith.

CAMASSIA LEICHTLINI.

Camassia Leichtlini (S. Wats.) is certainly the finest species of this altogether attractive genus. It is more robust, not only in constitution, but also in its proportions, than any of the others. I find I planted it first in 1897, and I think started with two or three bulbs only, and now, as the accompanying illustration shows, more than 25 spikes were borne by their descendants,and two years ago I lifted the clump, and planted only about half of the bulbs in this original site.

It was figured in 1877 in the "Botanical Magazine," t. 6,287, as C. esculenta var. Leichtlini, but is now accorded specific rank, and so entered in the Index Kewensis. Discovered by Mr. John Jeffrey in British Columbia in 1853, it was not introduced to Britain apparently until sent to Kew by Herr Max Leichtlin in 1872, where it flowered in 1873.



CAMASSIA LEICHTLINI.
A finely-grown specimen in the gardens of Myddleton House, Waltham Cross. The typical form which has creamy-yellow flowers.

The typical form has flowers of a very distinct shade, a creamy-yellow, with a tint of green in it, and is very effective in a mixed border or in the rock garden. I have a small group (not the large one here shown) now in flower, the spikes rising up into a large bush of Rubus deliciosus, and the effect is very charming. I much prefer the blue form of this plant, however, known as C. Leichtlini (blue), in bulb lists. It is of a fine rich purple shade of blue, and quite as robust as the typical form. I grow a clump of it among wide groups of dwarf almond, and every year I am delighted with the effect of its tall spikes of blue coming out above the tender green leaves and last few pink flowers of the amygdalis.

Besides these there is a fine set of seedlings, the best of which I got from Messrs. Barr some years since. Purple King is one of the finest deep blue-purple flowers I know, and the pure white form makes a worthy companion to it. I grow both on a raised ledge of the rock garden, with a carpet of Erica herbacea and E. hybrida.

White Fritillaria meleagris comes up through the pink heaths in early spring, followed by these two camassias, and later still by Brodiæa congesta. This has proved a very satisfactory bit of planting. I am always more pleased over discovering a combination of plants that will prove good helpmates than any other phase of planting and grouping. Not only does one enjoy the contrast of the mingling colours and forms, but there is a vast satisfaction in feeling you have economised space that must almost equal that of the celebrated child recorded in Punch, who, when charged with being wasteful in eating jam and butter, answered that it was through objects of economy, so that one piece of bread should do for both.

E. Augustus Bowles.
Myddelton House, Waltham Cross.

YARROWS FOR THE ROCK GARDEN.

Achilleas, or yarrows, are beautiful little plants for the garden, and as they are as well suited for the small rockery as for the rock garden of large dimensions, they deserve the full consideration of all who are looking cut for the best flowers for these purposes. Some of the plants in the genus Achillea are too tall for our object, but from the remainder we can choose eight or nine which will form a basis of selection, and this without including among them any which cannot be purchased from the trade, or any which should cost more than ninepence per plant.

As all are of easy culture in pure loam, or loam with the addition of sand and grit, with a little lime in some form or other, and full exposure to sun, little need be said in the way of cultural directions, as they will thrive well in a level part of the rockery or jammed in between two stones. We may thus proceed at once to consider the various species best suited for our purpose as already indicated.

Achillea argentea.

First we may take the Silver Yarrow, Achillea argentea, a delightful little species, giving us pretty mounds of silvery-white foliage and a profusion of small white flowers. This is one of the prettiest of the dwarf forms, and as its height is only some six inches or so, while it blooms through June and July, it is a valuable plant for the rockery. It is thoroughly hardy, and forms a beautiful little thing, whether in or out of bloom.

Achillea Clavennæ.

Clavenna's Yarrow is a worthy rival to the silver one, and is of much the same character, producing, as it does, a plentiful supply of silvery leaves, finely cut, as, indeed, are those of A. argentea, and giving us also a great number of its little white flowers from April to June. Its earlier flowering is useful ofttimes, but it should not be cultivated to the exclusion of its sister flower, whose later flowering is most valuable. A. Clavennæ grows to about six inches in height.

Achillea Hausmanni.

Hausmann's Yarrow is another very desirable little species, of almost the same height as the preceding, but the leaves are not quite so white—at least I have not seen them so silvery in tone—but also prettily cut, and looking most pleasing when the plant has attained a good size. The little mound of leaves is prettily covered with white flowers, small in size, but in corymbs of considerable numbers of blooms. It flowers about the same time as the silver yarrow.

Achillea Huteri.

Huter's Yarrow is another very charming little species of achillea, flowering from May to June, and remarkably pretty, with its mounds of white, finely-formed leaves, and its many little white flowers. Growing only about six inches high, it is one of the most appreciated of the dwarf members of the race.

Achillea moschata.

The Musk Yarrow is not nearly so well known as the preceding, and it can hardly be said that it is of equal merit, as its leaves are not of the silvery tone which renders the others so valuable, even when out of flower. They are bright green, but their beautifully cut formation gives them a pleasing aspect, while the white flowers which are generally produced from June to September, are useful in their time. It is about six inches in height.

Achillea sericea.

One of the most charming of all the species of yarrow, A. sericea rather dislikes our climate, and in some winters is seriously injured by the wet lodging in its foliage, which is soft, fine, and silky, so that it has been aptly called the silky yarrow. Its main charm lies in this foliage, which is wonderfully beautiful, but its flowers are not so free or so beautiful as some other species. It is rather trailing in its habit, and looks beautiful hanging over a stone. Its height is about six inches.

Achillea tomentosa.

The Woolly Yarrow is a distinct-looking little yarrow, with a creeping habit, and giving rather woolly leaves, finely cut, and plenty of little yellow flowers in flat heads. It prefers a dry situation, and grows only about half a foot in height. This is a really good species, distinct from the majority of the dwarfer ones.

Achillea umbellata.

The umbel-flowered yarrow is prized mainly for its pretty foliage of a beautiful silvery-white, and its generally neat habit. It is usually from four to five inches high, and its flowers, which are in corymbs, are white. It flowers from June to September.

In speaking of these flowers I have refrained from referring to A. ageratifolia, which is best known as Anthemis Aizoon, but which seldom appears in gardens as an Achillea. It is well known as a charming species, its silvery foliage and white flowers being most pleasing. Propagation of all these species is effected by seeds, division, or cuttings. S. Arnott.

RHODODENDRONS AT REGENT'S PARK.

Although we have now a wealth of flowering trees and shrubs during the springtime, and also a considerable number that carry on the scene of beauty into May and through June, it is not easy to conceive a garden of any pretensions in which rhododendrons do not occupy a prominent position. The great majority of garden rhododendrons are more or less evergreen, and thus are useful at all seasons of the year, but it is during May and June that they contribute so liberally to the beauty of the garden and pleasure grounds.

Rhododendrons are not difficult plants to grow, provided lime is not present in the soil in any quantity. It used to be considered quite necessary to provide a quantity of peat when it was proposed to fill a bed or border with these grand shrubs, but we are wiser now, and though peat is an excellent rooting medium for them, it is by no means essential, consequently the very considerable expense that the provision of peat would necessitate in some places need not be incurred. Good loam, some leaf-mould, and some old hotbed manure well mixed together will suit all the garden rhododendrons admirably.

In not a few gardens rhododendrons are plentiful, but they are often seedlings that have arisen and been allowed to survive in the struggle for existence; or they may be old and comparatively worthless varieties, planted only for the woodland margins or for cover. In such cases it seems a real sin to allow good space to be occupied by poor varieties, when such excellent ones can be obtained cheaply. One needs to examine a good collection of rhododendrons to discover how varied are the colours, forms, and markings of the varieties, and when we see these latter in first-rate condition we readily realise their differences, and some will appeal to us more than others. Not everyone has the time to pay a visit to a nursery where rhododendrons are, and for long have been a speciality, but even such a visit is not essential to those who are proposing to make a selection, for Messrs. John Waterer and Sons, of Bagshot, Surrey, have brought a splendid selection of plants and varieties to the gardens of the Royal Botanic Society, Regent's Park, and arranged them in the most delightful manner to form a rhododendron garden. This garden is under canvas, and laid out in long borders and beds of various sizes, with grass margins and ample pathways. Moreover, the garden is not on a dead level, consequently excellent views over it are obtained from the higher points, and splendid masses of colour greet one's gaze from the lower points.

Nearly 2,500 plants are set out to form this fine exhibit, an exhibition that is probably the largest in the world set up by any one firm. The plants vary from young dwarf stock, about 2ft. high, up to tall bushes and standards 10ft. high. There is a beautiful display of bloom at present, but hardly such a blaze of colour as is seen sometimes when the exhibition opens, but this is by no means a disadvantage, as it ensures a fine display all through the present month.

RHODODENDRON MRS. E. C. STIRLING.
Large trusses; flowers blush pink.

Conspicuous among the many splendid varieties raised at Bagshot is Pink Pearl, the pearl of hardy rhododendrons, its magnificent trusses of pink blooms standing out prominently and grandly. The new Mrs. E. C. Stirling, that was a great attraction at the recent Temple Show, is another distinct variety, with big trusses of blush-pink flowers. Gomer Waterer seems better than ever, and the bold blotches of Francis B. Hayes make it a very striking rhododendron. In rich rose or scarlet shades the varieties Helen Waterer, Michael Waterer, Mrs. John Waterer, John Waterer, Kate Waterer, Frederick Waterer, make up a fine set, that carry on the traditions of the firm. Among white or light colours we were struck by the beauty of Chionoides, Duchess of Connaught, Exquisite, Madame Carvalho, Minnie, Mrs. Walter, Sappho, Queen, and Princess Christian. But one might go on at great length naming varieties, for all the good things on view have their own special merits.

Besides the rhododendrons there are Japanese maples, beautiful kalmias, and a fine group of viburnums, the whole making up an exhibition worth going a long way to see.

An additional attraction is a group of Japanese pigmy trees and a collection of alpines, irises, ixias, etc., arranged in a separate tent by Messrs. Barr and Sons, of Covent Garden.

Rain and Shine at Leonardslee in May.—Mr. W. A. Cook writes us that rain to the total of 1.54in. fell at Leonardslee in May, on ten days, the total for the first five months of the year being 8.61 in., as against 10.91in. for the corresponding period of 1908, and 2.84in. for May, 1908. The highest temperature for May was 133 degrees in the sun on the 23rd, and 80 in the shade on the 22nd, while the lowest temperature on the grass was 29 degrees on May 1. Highest temperature in the sun for May, 1908, was 134 degrees; in the shade 75 degrees; and the lowest on the grass, 35 degrees.

ASTILBE NOTES.

The popularity of the astilbes and spiræas for waterside and bog gardening is becoming more noticeable as time wears on, and certainly there are few subjects which are more decorative for the purpose in hand than those under our present notice.

The issue of the GARDENERS' MAGAZINE for May 24 contained interesting notes upon the spiræas and astilbes, and, without treading the same ground as the writer of those notes, I wish to further advocate the merits of many fine forms, chiefly of hybrid origin, with the view of extending as far as possible the collections of astilbes at present grown in our English gardens.

BEGONIA PINK PEARL.

A handsome double-flowered tuberous variety, bearing large salmon-pink flowers. A.M., R.H.S., May 25. Messrs. Blackmore and Langdon.

The splendid work already rendered by the hybridist is fully exemplified by the beauty of those delightful forms, Queen Alexandra and Peach Blossom, which are already enjoying a vogue in our English gardens. These pleasingly coloured gems are the result of crossing the old favourite Astilbe japonica with A. chinensis, and the offspring certainly show an advance in beauty upon the parents. But while these fine forms are becoming well known, the splendid hybrid forms raised by Messrs. Lemoine, of Nancy, are deserving of a wider recognition, and though some of the earlier acquisitions have found their way into various gardens, yet one would endorse the plea for an extended knowledge and better recognition of the finest forms at the hands of our garden lovers.

The collection raised by the famous French firm is not lacking in numbers, and a brief survey of the chief of them may perhaps be of interest to the reader, especially as some good coloured varieties are amongst the number. The fine hybrid rutilans (Brilliant) represents a pleasingly novel colouring which should ensure it something more than a passing notice. It is very free, both in growth and blossom, and the plumy spikes of blossom are coloured rosy-carmine, which passes into rosy-mauve with age. Its companion, rubella, is a notable free-growing hybrid, with enormous plumy panicles of delightfully shaded rosy-pink blossoms. It is of a strong, bushy habit of growth, and the spikes are produced in great quantity. The bright-hued carminea, with its tall, erect panicles of deep carmine blossoms, which shade to mauve, is of pleasing appearance, being more graceful than many forms, by reason of the lightly-flowered plumes.

Féerie, or Enchantment, is a noteworthy hybrid, with a tall, graceful habit, and very refined foliage of a blackish-green hue. The masses of blossom are of great size, while the colouring is a pleasing flesh colour.

Semaphore, again, is tall, with branching flower spikes, with a tendency to incline at the apex. The colouring is soft pink, passing to a creamy shade with age. Mousseline, which may be rendered Muslin to suit out English tongue, is a compact variety, with close, well-filled flower spikes. These are inclining at the top, and the colour of the blossoms is rosy-lilac. In Nébuleux (or Cloud of Mist) we note another with close-growing flower spikes, well filled, with foliage of a light pleasing character. Dame Blanche (or White Lady) is a pure white, dwarf in habit, with compact and showy spikes of blossom. Amazone, with its tall, erect habit, and its light effective appearance, presents a pretty appearance, as the colouring is white, shading to carnation.

Other useful forms include some fairly well-known hybrids, among which are Silver Sheaf, a good white, with a reflection of rose in the blossoms; Snowy Sheaf, a grand pure white, with bushy habit, and plumy, well-filled flower spikes; Rosy Cloud, with its soft rose-coloured blossoms; Snowy Plume, a compact flowered form, a clear white in colour; and Panache, a graceful, branching blush-white. Equally good, but hardly so well known, are pyramidale, a fine erect gem, with large branching spikes, clad with milky-white blossoms. Olympe, a notable pink variety, with good lightly-flowered spikes of tall growth. Girandole is a pleasing blush-coloured form; and Geyser, an effective creamy-white, with a good compact habit.

The fact that such a range of astilbes are so readily obtainable, together with those grand species Davidi and grandis, and the old favourites, Thunbergi, rivularis, etc., should lead to extended plantings of these subjects. Where the bog garden and watersides are features, a good collection of astilbes will be of especial value for creating delightful picturesque effects. Given a good loamy soil, moderately enriched with decayed manure and leaf-soil, the astilbes will prove themselves capable growers, and the luxuriance of foliage and blossom (secured by giving them a good rooting medium will more than compensate for any little trouble in this direction.

Certainly, the newer astilbes merit an extended trial, which will probably mean an increase in popular favour.

P. S. HAYWARD.

CARRIAGE DRIVES.

Ostentation in the case of a carriage drive is not in keeping with the quiet and charm of a garden, especially when the drive is of considerable length. A free planting of shrubs, in groups, rather than in long borders, backed by trees, forms a fine setting for the carriage way, especially if the grass is well kept around these groups. In our opinion the only parts of a carriage drive where a regular display of flowers should be made are those near the gates, lodges, and house-front. Such a display may be accompanied by statuary and vases, but these must be used with the greatest care or a suggestion of extravagance will be at once apparent. The accompanying illustration of a carriage drive in a Teignmouth garden shows what can be done with shrubs, neat lawns, and summer bedding plants in vases. In this case, the channelling on either side of the drive is of an expensive character, and excellent from the point of usefulness, but rather too obvious for such a position. A well-cut grass edging would probably have sufficed, and if the vases had been set back from the edge a couple or three feet they would have been more pleasing.

LAWNS.—Those who desire to make a new lawn or bowling green, or to renovate and maintain existing ones in good condition, can have no better guide than "LAWNS AND GREENS," by T. W. Sanders, price 1s. net, by post 1s. 2d.; bound in cloth 1s. 6d., by post 1s. 9d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

SOME DIFFICULTIES OF PLANT CULTURE.

(Continued from page 398.)

◆

Distribution of Plant Diseases.

Another method of distribution of plant diseases is that caused by insects. This is of very common occurrence, but has not received the attention from the cultivator which it deserves.

The gnawings, borings, and punctures of insects, injurious as these often are, can by no means be reckoned as the whole of the injury which they do, and sometimes they are the least part of it. As carriers of disease, insects are no less potent in the vegetable than in the animal world.

The bacterial wilt of cucumbers, melons, and allied plants is of frequent occurrence, and often does great injury. It is due to a very sticky white organism, which fills the water passages, and thus brings about a sudden collapse of the plant. Wilting vines are very full of virulent sticky germs, ready to be carried away on the beak or jaws of the first visiting insect, and deposited on the surface or in the interior of the next plant that is bitten. Dr. Erwin F. Smith states that he examined nearly a thousand freshly-blighted leaves, and found small gnawed places inside of the wilted area of every one, and in such relation thereto that the wilt appeared to have proceeded outward from the bitten places. The disease is readily killed by exposure to bright sunlight and to dry air.

The rôle of mollusks (snails and slugs) in the dissemination of fungoid and bacterial diseases is also an important one. The subject is new even to scientific men, and most cultivators know nothing about it. Nevertheless, the indirect damage done by these animals as carriers of disease germs is often immensely greater than the immediate and visible injuries they induce by feeding. Mr. G. Wagner published recently an interesting paper on the spread of fungi by snails. He experimented with various downy mildews. Snails of various sorts were transferred from diseased to healthy plants and the disease appeared on the latter; the snails were fed with various parasitic fungi and a subsequent examination of the excreta of the snails showed the spores of these fungi passed through the animals uninjured, and in condition to germinate. Finally, the dung of these snails was dissolved in water and painted on the leaves or stems of host plants, and the disease followed. Mr. Wagner thinks that fungi are very commonly distributed by snails.

The bacterial rot of cabbages, cauliflowers, and broccoli is a disease tolerably well known to market gardeners. It blackens the veins of the leaves and the woody rings in the stems, causing the leaves to wilt, and sometimes to fall off, and prevents the formation of heads, or spoils those which have already formed. The disease is due to a micro-organism, and is disseminated in various ways, frequently by means of the common greenhouse slug. Insects are probably also carriers of this disease.

A very common danger is the spread of parasitic diseases by way of the manure heap. Farmyard and stable manures always contain a great variety of organisms, most of which are harmless to plants. Occasionally, however, some parasite gets into the manure heap; here it finds a congenial place for external growth, and is finally hauled out by the unsuspecting cultivator, and put just where it can do him the most damage. Sometimes the spores of these parasites find their way in through the fodder or bedding of the animals, but they are also, probably, occasionally introduced along with mouldy or rotting vegetables and rubbish, or by diseased plants which have been thoughtlessly thrown into the farmyard or piggery, or on to the manure heap, instead of being burnt as all such diseased plants should be.

Manure, and more especially that intended for the greenhouse or glass-frame, should at least be kept free from the rubbish of plants that have been attacked by parasitic diseases, and ought to be thoroughly composted and rotted before it is used.

Many diseases are distributed in seedlings, bulbs, buds, and cuttings, and too much care cannot be exercised in their selection. Among these diseases may be mentioned the Easter lily disease, certain violet and pansy diseases, and the hyacinth bulb disease. Some bad cases of the spread of club-root disease by young plants of the cabbage and broccoli family from infected seed beds have been seen by the writer.

But perhaps the most wholesale manner of distribution of plant diseases is through the medium of irresponsible commercial cultivators.

In this way all sorts of fungi and insect pests are spread from one end of the country to the other. Many examples might be adduced. I have seen a whole plantation of black currant trees destroyed by the currant-mite transmitted in young nursery stuff. There is no good reason why all this nursery stock should not be fumigated or otherwise treated in a dormant condition. If done properly the scales, fungoid germs, and insects would be destroyed without injury to the plants.

Of the diseases of the greenhouse, perhaps the worst are rust of chrysanthemums and carnations, leaf-spot disease of violets and roses, rot of cucumbers, melons, and tomatoes, and the wet rot of hyacinths and

PART OF AN EFFECTIVE CARRIAGE DRIVE IN A TEIGNMOUTH GARDEN.

allied plants. It is not enough to pick off the diseased parts. They must be disposed of properly. Loss may result from throwing diseased leaves or plants under the benches. If this is the only method of disposal they might almost as well be left in place. It is always best and safest to burn all infected plants or portions of plants picked off.

Harpenden. J. J. Willis.

(To be continued.)

BIG CROPS OF MELONS.

As a rule, the majority of cultivators do not obtain as many melons from a given space as they ought. The plants are put out about 3ft. or 3ft. 6in. apart, and from each one from three to six fruits are obtained; but it requires very skilful management to secure more than four ripe fruits from one plant at the same time. This system answers very well, no doubt, where space under glass is not of great moment, but where it is small, and the demand for melons great, it behoves the cultivator to do his utmost to meet that demand to the best of his ability from the accommodation at his disposal. In such circumstances, I strongly advise

The Cordon System

of growing melons, which to some readers will be quite unknown. I am quite sure that a beginner is much more likely to succeed in growing a satisfactory crop of melons by adopting this plan than by following the older method. It is a difficult matter to obtain more than three female flowers fully developed at the same time, and a very easy matter to produce two. Well, if two fruits set, and swell perfectly on each plant, a very full crop can be secured from a small space. Suppose we take a house 30ft. long, one side of which is cropped with melons—if it be a span-roofed structure. At 3ft. apart there would only be room for nine plants, and, if the average number of fruits on each plant was three, there would be a total of twenty-seven fruits; but we may say the total is thirty.

In the same space there would be room for twenty-eight cordons at 1ft. apart; and, allowing two fruits to each, we should have a total of fifty-six fruits, but we may say fifty. This is a big gain; indeed, it represents nearly two crops under the older system of allowing a great deal of space for each plant. For many years I have grown melons on the cordon system, and never failed to secure a big crop. For the benefit of the inexperienced, I will briefly describe how I carried out the work.

Raising Young Plants.

Melons thrive best in plenty of heat and moisture combined, and, if the former can be commanded, the latter condition can be readily complied with. Even in houses where there were plenty of hotwater pipes I always made up a hotbed on which to start the plants. There was then never any risk of the lower roots becoming too dry owing to the close proximity of the pipes, and I was, further, able to raise them nearer to the roof glass.

One seed was placed in each large 60 pot, the latter plunged to the rim in a propagating frame. By the time the permanent hotbed had cooled sufficiently, the young plants were fit to put out—being in their first rough leaf. I never favoured keeping the seedlings very long in the pots. The compost for the seeds was made up as follows: fibrous loam three parts, leaf-soil one part, and a little coarse sand. On the hotbed good loam of a medium heavy nature was mainly used, only a little lighter material, sand and leaf-soil, being placed where the plants were to be put out.

The depth of the soil was 7in., except where the ridge was formed for the plants, and there the soil was 1ft. deep. They were put out at a distance of 1ft. apart, in soil made exceptionally firm, while it was in good working order—not too moist.

Training.

Of course, water was given in a tepid state to maintain the soil in a nice moist condition. The vines were trained to wires 1ft., or rather more, from the roof glass, and when they had reached about 3ft. up the points were pinched off. Side shoots, already appearing, grew rapidly, and these, in turn, were stopped at one joint beyond the fruits, and when they were seen to be growing freely, all sublaterals were regularly removed.

Other Necessary Treatment.

Directly roots were visible on the surface of the border soil a rich top-dressing of rotted manure and loam, mixed, was put on 2in. in thickness. While the fruits were swelling feeding with artificials and liquid manure was judiciously attended to, and syringing and damping down also, according to the state of the weather.

The fruits were duly supported with soft matting or nets, ventilation was freer when the fruits were ripening, while water at the roots, and atmospheric moisture, were reduced very gradually, as the melons approached the ripening stage; but I always liked to keep the leaves fresh and green right up to the last. I found by doing so the flavour of the fruits was better than when excessive and premature drying of the border occurred.

Geo. Garner.

ROSE MARGARET.

A charming hybrid tea, the flowers large and of superb form, and the colour a delightful shade of pink. A.M., R.H.S., May 25. Messrs. William Paul and Son.

TEMPLE SHOW NOVELTIES.

With the publication of the three photographic reproductions of new flowers that accompany this note we complete our illustrations of the more noteworthy objects at the exhibition held by the Royal Horticultural Society in the gardens of the Inner Temple. In mentioning this fact, we would say that we much appreciate the congratulations we have received from many of our readers on the fulness and fidelity with which we have illustrated this great gathering.

The novelties herewith illustrated are: Begonia Pink Pearl, an exceedingly beautiful variety, with large, finely-formed salmon-pink flowers, raised by Messrs. Blackmore and Langdon, Twerton-on-Avon, Bath. Rose Margaret, a charming hybrid tea, with large exquisitely-formed blooms of a pleasing pink shade, raised by Messrs. W. Paul and Son, Waltham Cross. While the blooms are so perfect in form as to place the variety in the front rank of exhibition roses, it is so free and continuous in flowering as to possess merit of a high order for the garden. Rose Mrs. Taft, a free-growing and profuse blooming dwarf polyantha, bearing its neat deep rose-coloured blooms in elegant trusses. This was exhibited by Messrs. H. Low and Co., Enfield. Each of the three novelties had an Award of Merit made in their favour.

DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of these popular flowers is "Dahlias and Their Cultivation," by J. B. Wroe, price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from The Gardeners' Magazine Office, 148, Aldersgate Street, London.

PEACHES ON OUTSIDE WALLS.

To grow peaches well, and keep the trees in a healthy, flourishing condition, even under glass, requires constant care and attention, but to produce the finest crops from trees growing in the open tests the skill of the most practical cultivator in some localities, for though peach trees are hardy, seldom suffering from the effects of frost, provided the wood is thoroughly ripened, there are many things to be taken into consideration if the finest results are to be obtained. If only one-half of the labour and attention were given to trees growing against walls in the open as is paid to those growing under glass, the results would no doubt be far different to what they usually are.

It is seldom that we see elaborate preparations made for drainage, or a special compost prepared for trees planted against outside walls. On the contrary, in the majority of cases a hole is dug in the border, the roots placed therein, and the tree left to take care of itself, the roots having to battle with those of some strong-growing vegetable crop for an existence. In such positions, and under these conditions, can it be wondered at that peach growing in the open is a failure? Now, if it is necessary to make such preparations before planting trees under glass where their roots are under complete control, how much more essential is it that due attention be paid to the preparation of borders where trees are grown in the open. True, there are some soils that are naturally well drained, and are of such fertility that trees will grow in them and remain in a healthy condition for a considerable time, but there are others that need much attention to render them suitable for the growth of these fruits.

Garden walls are an expensive item if constructed properly, therefore it is well to give the matter due consideration before commencing the work. For a wall to be of the greatest service it should be from twelve to fourteen feet high above the soil, and the border should be at least one and a-half times as wide as the wall is high—that is, if the wall is twelve feet high, then the border ought to be eighteen feet wide, having a slope from the wall to the path of at least a foot. Where the soil is at all retentive, resting on a bed of clay, it will be necessary to provide ample drainage. If a bed of old brick rubble or broken sandstone be put down level with the foundation, this will not only help to drain the border, but will raise it up somewhat above the level of the surrounding ground. It will also be necessary to add porous material of some kind to the soil to render it less liable to get water-logged. I have seen peach trees planted in soil that, naturally, would have made good bricks, without the least material being added to render it more porous. How could they be expected to thrive? one may ask.

Having built the wall, and made the border, our next consideration is selecting and planting the trees. There is nothing gained by planting what are termed fruiting trees, and it is better to procure some that are two or three years old, as these will grow away far more rapidly and make better trees in the end than those of larger size. Planting should be done as soon after the leaves have fallen as possible.

All gardeners know that peaches fruit on the preceding year's wood, therefore the aim should be to have this in the finest condition possible, not so rank as to resemble bamboo canes, neither should it be so attenuated that wood buds are invisible except at their terminals. If the growths have received due attentions through the summer they will be of the thickness of a goose quill, being studded with treble buds for the greater part of their length. There should be no difficulty in ripening such wood as this, provided the borders are properly drained as described; but should it have a tendency to become rank, then the trees ought to be lifted in the autumn and the roots brought nearer to the surface. Where the border is occupied by a vegetable crop, this would entail a considerable amount of labour, as the crop would have to be lifted and transplanted previously. If vegetables are planted on fruit borders, there should always be a clear space of at least four feet allowed next to the wall, as this will admit of a person being able to pay due attention to the trees during summer, and, if necessary, to their roots in winter. Peaches, as a rule, make ample roots, but where the border is deeply dug for a vegetable crop, the majority of those near the surface are cut off during the operation, leaving only those that are out of reach of the spade. Where this system is practised there can be no wonder if the trees soon get into an unhealthy state, especially where the soil is not properly drained, or is of inferior quality.

There is every prospect of a full crop of fruit this season where the trees have received due attention, not for some years have the flowers set so freely, but it is well not to overcrop them, and severe thinning must be practised. Not only should the thinning be done soon, but the trees ought to be liberally treated to enable them to bring the crop to perfection. Some have an idea that thinning should be deferred until stoning has taken place, but if this is done the mischief may have gone too far, and the trees be unable to recover themselves before growth becomes arrested, and the results are anything but satisfactory. Many of the early varieties will by this be on the point of stoning, therefore thinning should be taken in hand as soon as possible.

Buxted Park Gardens.

ROSE MRS. TAFT.

A free-flowering dwarf polyantha variety of much value for massing; the flowers deep rose, and freely produced. A.M., R.H.S., May 25. Messrs. Hugh Low and Co.

Horticultural Traders' Outings.—It has been said on more than one occasion, and by such an eminent authority as Sir Albert K. Rollit, that horticulture has done very much to create and maintain a friendly feeling between Great Britain and France. We may add that horticulture has no nationality, and creates no enemies, though, with some pride, we feel that nowhere has horticulture advanced so greatly as at home in this country. This season there are to be several outings that can scarcely fail to greatly increase the friendliness of three nations. German nurserymen and landscape gardeners are coming to England for a fortnight to study business procedure and the art of landscape gardening as practised among us. A party of French nurserymen have arranged for a trip through the seed growing districts and forestry nurseries of Germany; and British traders propose to visit the chief nursery centres of France.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

COOL ORCHIDS.—It is at the present time and during the hottest months of the year that the greatest difficulties are experienced in the cultivation of cool orchids. In the case of Odontoglossum crispum many of the plants will have recently been in flower, and the strain of flowering is usually most severely felt when it is followed by a period of warm, dry weather. One of the greatest mistakes made is that of permitting the flower scapes to remain too long on the plants after the flowers have become fully expanded. If the pseudo-bulbs commence to shrivel it is rarely they can be induced to regain their normal state until the next new growth commences to root, consequently the advancing growth becomes detrimentally affected. I cannot lay down any hard and fast lines to be followed to the letter, because the plants are grown now extensively in practically every part of the country, at different altitudes and under widely different conditions. One must be used to the conditions and circumstances before he is able to determine the needs. I find a good plan in hot weather, and when the outside conditions are favourable, to syringe or spray the plants overhead once or twice a day, in addition to keeping the stages, floors, etc., frequently damped. The ventilators also must be used with discretion. I find it advantageous to shade heavily in hot weather, and thus with plenty of moisture in the atmosphere keep the temperature cool without resorting to opening the roof ventilators too freely. But, on the other hand, should the outside atmosphere be practically saturated after heavy rains, a considerable advantage is derived by the use of the roof ventilators, and of course shading from excessive light. The advantage of keeping the blinds raised well above the glass so that a current of fresh air can circulate between the blinds and the glass cannot be overestimated when considering the cool-house orchids. It will be found that where the blinds are allowed to rest on the glass the latter gets very hot from the sun's heat, and it is thus impossible to keep down the temperature and maintain desirable conditions inside the house.

REPOTTING.—I do not advise repotting of the cool orchids until after the hot season has passed, but there frequently occurs cases where the compost is in an advanced stage of decay, or it may be a valuable plant needs more rooting space, and is in proper condition for repotting; under these conditions one has to consider how to act. If a plant is in a proper stage for repotting, little harm is done irrespective of the season, providing that proper attention and conditions are afforded. The compost we find suitable for all our cool-house orchids is composed of fibrous peat or osmunda fibre, broken oak or beech leaves, and chopped sphagnum moss, in equal proportions, with sufficient silver sand added to render this porous.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

GLOXINIAS.—Where seeds were sown early in the year to produce plants for autumn flowering the young seedlings will now be making good progress. Provide plenty of moisture in the atmosphere by repeated damping, and supply the plants with weak soot water to give colour and substance to the flowers and foliage. They will require to be well shaded, as well as those coming into flower, but to these latter a cooler house should be given. When early batches have finished flowering reduce the water supply very gradually until the tubers have become well ripened, when no more will be necessary during the resting season. The stock may also be increased by propagation of the leaves laid flat upon a bed of sand; cut the thick ribs, and, with pegs or stones keep the leaf in position in a brisk heat.

CALADIUMS need a light and open soil, and efficient drainage, so that the water may pass readily away. A good compost consists of about equal parts good turfy loam, peat, and leaf-soil, with some horse droppings and a good sprinkling of wood ashes and sand; shade from bright sunshine, and spray frequently among the pots. Give frequent watering with liquid manure when the pot becomes full of roots to assist the colouring and increase the size of the leaves. at this season so well brought out. Carefully guard against any injury to the leaves. For the leaf stems of some varieties neat stakes will be necessary. Later batches, which sometimes prove so serviceable, should be given their final shift. Grand examples of these fine foliage plants annually appear at the Temple Show and other leading exhibitions.

ACALYPHA HISPIDA.—To produce the tassel-like flower spikes which are the chief attraction of this plant, and spring from the axils of the leaves, liberal treatment is necessary if they are to range from 12 to 18 inches in length; 8-inch pots are necessary, because of the free-rooting character of the plant, even to support a single stemmed specimen, in which form they are the most attractive. Discontinue syringing when the tassels are formed.

APHELANDRAS are very attractive during the winter months, when well grown in loam, peat, and sand, in small pots. A. Fascinator, with its beautifully marked leaves and scarlet flowers, invariably commands admiration. A. nitens, A. Bausei, and A. aurantiaca are all good; a brisk temperature is necessary to success, with protection from bright sun. The yellow-flowered A. Leopoldi flowers during the summer.

DRACÆNAS.—Plants raised early in the year will now be in good condition for shifting into five-inch pots, and a brisk stove heat, with plenty of moisture, and a position near to the glass is favourable to vigorous growth. Well-furnished plants in pots of this size will be found most suitable for many purposes. Shade lightly, close early, and syringe freely. The raising of young stock in quantity from old plants that have lost their lower leaves can be accomplished at the present time by divesting them of what leaves remain, and laying the stems in a propagating pit or frame, partly covering these with light soil. Young growths will soon start, and when from three to four inches long separate them from the old stem with a sharp knife and a portion of the old wood as a heel; put singly in small pots, and return to the same quarters, when roots will soon be made.—W. Fyfe, Lockinge Gardens.

FRUITS UNDER GLASS.

EARLY VINERY.—Keep the house containing ripe grapes cooler, afford plenty of ventilation top and bottom, but do not allow the borders to become dry. Give sufficient water to maintain roots and foliage in a good condition, and damp the floor and borders at least once every day in fair weather. The growths may be allowed to extend, and by this means some amount of shade will be afforded. Black Hamburghs will benefit by this, and root action will still be encouraged. Keep the vines free from pests, and, if perchance red spider attacks the foliage, prepare some insecticide at once; a solution of soft soap and sulphur is about as good a remedy as can be had, and this should be sponged on both sides of the leaf.

MUSCAT GRAPES.—Keep the temperature at 75 degrees by day and 70 at night; stop the fires when the morning is bright, so that there is not much artificial heat during the day. Tie up the shoulders of large bunches, so that these will be shapely, and each berry will be able to swell up to its proper size and shape. Do not overcrop, as this is one of the worst evils in grape culture. Attend to the stopping of laterals as often as is necessary, but do not impose an undue check on the vines. Give liquid manure occasionally, and when doing this let the water be warm, for cold water is often a forerunner of shanking.

SUCCESSIONAL HOUSES.—Late grapes should have been thinned by this time, and much the same method of procedure will be applicable as for Muscats, except the heat. These late houses need only be kept up to 65 degrees, allowing plenty of air when the weather is fine. Too much heat and not enough air is the cause of much trouble in grape growing. Give plenty of water when required, and some good artificial manure. Pot vines raised this spring will now require a shift, and this will be into No. 10-sized pots, which will suffice for this season; and where any old vines are to come out as soon as the fruit is ripe, these can be planted in the border as soon as it can be got ready.

MELONS.—These are now in much request, and as frames become empty the young plants should be planted forthwith. The earliest batch in the melon house will now be finished, and some more plants should be ready to be planted, as soon as the house has been cleared and new soil got ready for them. The soil in either case should be good loam, and this should be made very firm as soon as the plants are put out. Melons set with great freedom at this season if lightly pollinated, and trouble may arise from leaving too many on a plant.

PEACHES AND NECTARINES.—Where the trees have been cleared give plenty of ventilation, and where the lights can be taken off let this be done, and so afford the benefit of air and sunshine to ripen up the wood; but do not neglect the syringing. The second house should be treated exactly as recommended for the first and subsequent houses. Late houses will probably require but little fire heat; anyhow, the heat should be turned off in the daytime, as too much heat is the cause of many troubles. Keep the growths nicely tied in, cutting away all that are superfluous; where the borders are well drained too much water can hardly be given at this time of the year.

TOMATOES.—These have fruited grandly this season, and as soon as the earliest fruits are over the plants should be removed to make room for new ones, as old, worn-out plants only help to make the place look shabby. Sunrise fruits and matures so quickly that there is no excuse for not having a good supply. Keep the plants to one stem, water well when necessary or the set will not be what it ought to be; very often a bad set has been caused by the plants getting dry at the flowering period.

CUCUMBERS.—If the earliest batch show signs of weakness prepare other plants to take their place. Those who use cucumbers much know the value of young and freshly-cut fruits, and these are much sweeter than those from old plants. Good crops will be coming along now in frames, and these answer well for cooking purposes, but for salads and for serving whole those grown in houses are preferred.—W. A. Cook, Leonardslee Gardens.

THE KITCHEN GARDEN.

ASPARAGUS BEDS.—These will have nearly completed their yield of heads for this season, and cutting should cease. It is very detrimental to next year's crop if the plants have not time to make up their growth. The aim should be to build up strength in the plants in every possible way. If the weather is dry a good watering with liquid manure or other stimulant should be given. To prevent the wind from damaging the strongest growths some form of support should be given them. Rows of string tied to stakes and run among the plants is the most simple and easy method.

LATE PEAS.—Peas are appreciated over as long a season as possible. To provide the latest supplies provision should be made for their sowing. Unless the soil has been deeply trenched during the winter trenches similar to those used for celery are of great advantage. Do not sow thickly, but allow reasonable room for each plant to develop. Gladstone and Autocrat are excellent varieties for late sowings, as they resist mildew and fill up their pods better than most kinds.

Give liberal supplies of water whenever the rainfall is light. Very much depends on the autumn weather, and a later sowing made in a favourable position will sometimes give a good return, but, as a rule, peas are not profitable far north.

LEEKS.—The earliest plants sown outside will be large enough for planting out. If extra large produce is required plant in trenches. For the general crop this is not necessary, but they may be planted on a well-tilled piece of land at from 15 to 18 inches apart. Water the plants to settle soon after planting, and supply it when dry till they have taken hold of the new soil.

COLEWORTS.—These are of great value during the autumn and early winter in producing sweet heads of greens of first quality. Make another sowing now, and place the plants, when large enough, in a border standing somewhat high; they will give a profitable return if planted about one foot apart, producing quantities of small compact heads until nearly Christmas.

ENDIVE.—Make sowings of endive, but only in small quantities yet. Select a cool position, and provide water whenever the weather is at all dry. The curled leaved variety gives a pleasing appearance to the salad, and is more adapted for summer use than for winter, being subject to damping during sharp frosts and wet.

SHORTHORN CARROTS. — There is usually a heavy demand for succulent young carrots, and the first sowings outside will soon be ready for use in quantity. Another sowing will be required to succeed these, and produce roots till the autumn months. A sweetened friable soil, free from wireworm, is of importance for this crop.

HERBS.—These, if sown as advised, will have grown large enough for transplanting. Go over the various kinds, thin out those that are too thick, and plant up any vacancies there may be in the rows. Should any sorts have failed sow again at once before the season is too advanced.

GENERAL REMARKS.—Late kales, etc., will now be finished, therefore clear the ground, and have it prepared to receive another crop. Weeds, as well as the crops, are growing, and at a great rate; endeavour to keep the young plants of all kinds free from weeds by having the rows hand weeded, and frequently stir amongst the plants with the hoe. Should any of them not be making satisfactory progress give light dustings of nitrate of soda or sulphate of ammonia.—CHARLES FLACK, Cholmondeley Castle Gardens.

A CHARMING BORDER.

Mignonette as a groundwork, with Shirley poppies waving above it to brighten the display, provides a simple, but most charming bed of flowers. For many years I made a practice of having such beds near the paths in the flower garden, and vegetable garden, too. In the latter I selected positions near the main paths and the entrances. The mignonette was sown thinly, broadcast, and a few of the poppy seeds dropped evenly among them, then I lightly raked in the seeds. In order to prevent any undue crowding the resultant seedlings were thinned out in good time. The mignonette lasts for a considerable time, the poppies do not, but as the flowers follow in quick succession the general display was maintained.

In order to keep up a succession of blossom throughout the summer fresh borders were prepared, and seeds sown in them every six weeks, or so, three sowings being ample for the purpose. The brilliant blooms of the poppies above the dense carpet of mignonette had the appearance, at a distance, of so many butterflies hovering above the sweetly-scented mignonette.

G. GARNER.

BIENNIALS.

Biennial plants do not flower the same year they are raised from seed, but are in perfection the year after. Various dates are sometimes given for sowing biennials, but generally they are not sown sufficiently early to produce fine plants by the time they should be planted out. July and August is the usual time for sowing, but I find it much better to sow about the first week in June, certainly not later than the third week of the month.

A border having an east aspect is suitable, and the ground should be clean and moderately rich. The drill system of sowing is less likely to produce drawn, weakly plants than broadcast. Should the weather be dry, a good soaking of water through a fine rose should be given, and then some branches, old mats, or other shading should be provided until the seedlings are breaking through the soil. Before the seedlings suffer from overcrowding, a well exposed border should be manured and well pulverised, into which they may be pricked off. This is the point in their culture of most importance, and one which early sowing allows plenty of opportunity for accomplishing. Plants that are allowed to remain in the seedling beds or lines till finally transplanted are never so fine as pricked-out plants. To secure a fine strong plant and satisfactory bloom, they should be stocky and strong, and lifted with good balls of soil and roots, conditions which cannot be commanded by later sowing and once transplanting.

When pricked out, each plant should stand a clear six inches from its neighbour. Biennials stand the winter much better when nursed thus. All attempts at throwing up flower stems must be checked by pinching them off as they appear.

To grow the majority of biennials well, they require a good loamy soil, and it should be prepared early. The end of September, or from that time till the middle of October, is the best time to plant out where they are to flower. I prefer autumn to spring planting, because autumn weather is generally much milder than that of early spring, and late moving is not to be recommended. If carefully lifted and planted in autumn, they obtain a good hold of the soil before the winter, but when autumn planting cannot be practised, they should be planted not later than the end of March in spring.

The chief points in the successful culture of biennials lies in early sowing, transplanting into nursery beds, and planting in early autumn with good roots attached.

T. B. FIELD.

Two Good China Asters.—It is scarcely practicable to represent every form of China aster in any one garden during a single season, consequently a selective process generally prevails in private gardens. For decorative purposes the single forms are steadily increasing in popular favour, being much in request at present for yielding a supply of cut flowers. The colours do not as yet embrace so wide a range as some of the double types, yet, though restricted, they produce excellent effects when carefully employed in beds among other summer flowers, while their flowering season extends late into the autumn. Another good China aster for bedding purposes is the ray aster; in this form the florets are long and tubular, and quite distinct from the familiar quilled aster of the exhibition table. It produces a quite novel effect when in flower, and as some delicate shades of colour are embraced by this section, its value in the flower garden may be readily conceived. Both these forms require early pricking off from the seed boxes, allowing ample space at every stage of growth.—THOMAS SMITH.

THE PRINCIPLES OF HEREDITY.

(Continued from page 441.)

Mendelism.

In order to gain an insight into the nature of Mendel's work, we cannot do better than turn to his original memoir, entitled "Experiments in Plant Hybridisation," of which an excellent translation has been published by Professor Bateson, the leading exponent of what is now termed Mendelism in this country. Even fifty years ago, experiments in hybridisation were, as we have already seen, no new thing. Mendel had many predecessors in this line of research, but it was reserved for him to introduce exact statistical methods into the work, and it is to these methods that he owed his success. It was already known that hybridisation, or the crossing of distinct species and varieties, might produce, and very often did produce, several distinct types of offspring from the same parents. Mendel was not content with this knowledge: he proceeded by numerous and often repeated experiments, extending over several years, to classify the offspring produced by hybridisation, to follow out their descendants from generation to generation, and above all to find out the exact numerical proportions in which the different types appeared in successive generations. It was the discovery of these proportions that furnished the clue to the mystery.

Mendel found the material which he required for his experiments chiefly in the numerous garden varieties of the common edible pea. How these varieties first originated we do not know. Probably they arose as sudden and apparently spontaneous variations, or as Professor Hugo de Vries terms them, mutations. No less than twenty-two such varieties were selected for experiment.

The next thing he did was to select certain differentiating characters upon which to concentrate his attention, and this is a very important point. Of course, all the varieties agreed with one another in most of their characters, in other words, they were all edible peas exhibiting the specific characters of the plant known to botanists as Pisum sativum, but they differed in numerous minor features. Of these differentiating characters Mendel selected seven for the purposes of his experiment, amongst which I need mention only two: (1) The form of the ripe seed, which, roughly speaking, may be either round and smooth, or angular and wrinkled; and, (2), the difference in colour of the contents of the seeds or cotyledons, which may be either yellow or green.

The two differentiating characters of each pair were artificially united by cross-fertilisation, the flowers of a round-seeded pea being fertilised by the pollen of a wrinkled-seeded pea, those of a green-seeded pea by the pollen of a yellow-seeded pea, and so on.

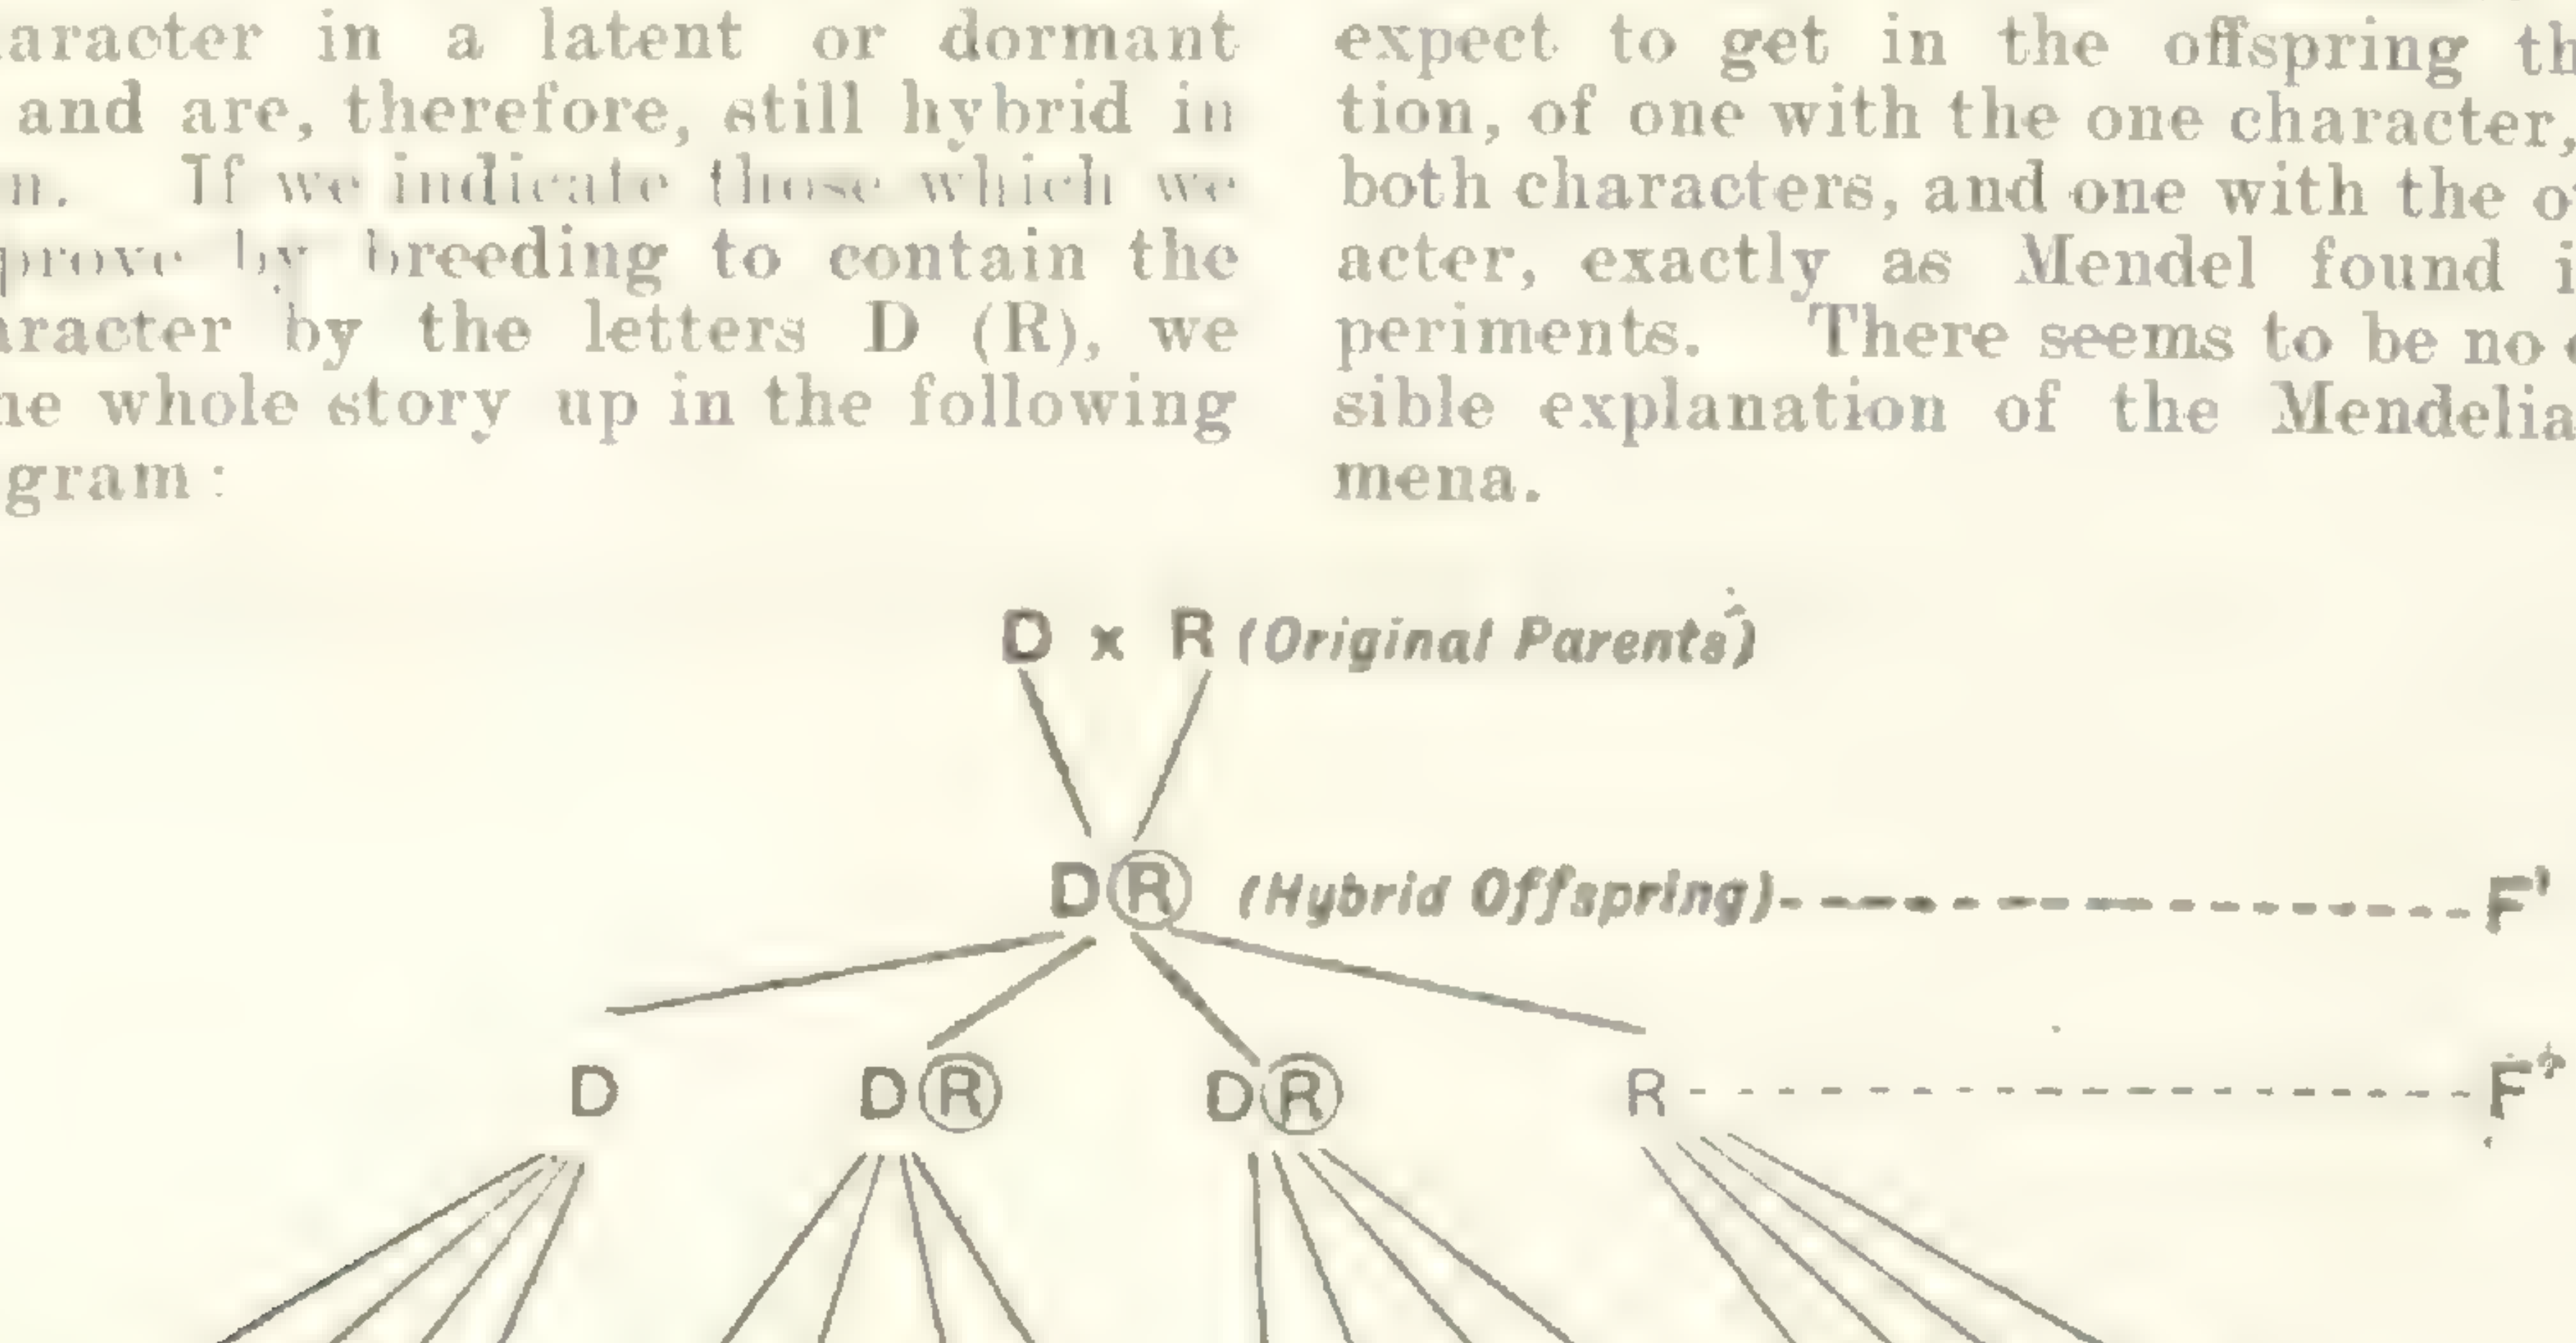
In this way a number of hybrid plants, represented in the first instance by seeds, were obtained, and the curious fact was observed, that each hybrid closely resembled one of the two parents, instead of being, as is frequently the case in other hybrids, intermediate in character between them. Further experiments with the offspring of the hybrids, however, showed that, although only one of the two contrasted characters manifested itself in the hybrid, the other was there also in a latent or dormant condition, and appeared again in subsequent generations. The character which appears in the hybrid is said to be dominant, while that which is suppressed is said to be recessive. In the case of these peas, then, one character was always dominant over the other in the hybrid, and, moreover, it was always the same character, and it did not matter whether it was derived from the male or from the female parent. Thus the round form of seed is dominant over the wrinkled, the yellow colour of the seed contents over the green, and so on.

Having obtained the hybrids, the next step was to follow the history of the offspring throughout successive generations. For this purpose the flowers of the plants raised from the hybrid seeds were allowed to fertilise themselves with their own pollen, no further crossing being permitted. The seeds thus obtained were now again apparently of two kinds, resembling the two original parent forms from which the hybrid was produced. Moreover, these two kinds occurred in definite proportion, three of the dominant to one of the recessive—three round seeds to one wrinkled, three yellow to one green, and so on. Of course, these proportions are only averages, and in order to eliminate errors of chance, large numbers of observations must be made—the greater the number the more reliable the result. To take an actual example from Mendel's work, 7,324 seeds were obtained in the second trial year from the hybrids between round and wrinkled. Of this number, 5,474 were found to be round, and 1,850 wrinkled—showing the ratio of 2.96 to 1. Again, out of 8,023 seeds produced by the hybrids between green and yellow, 6,022 were yellow and 2,001 green, the ratio being 3.01 to 1. These experiments have often been repeated during recent years, and it is found that the average ratio of three to one is always maintained.

Mendelian Proportions.

The significance of this proportion is not at first sight obvious. It is necessary to continue the experiment for at least another generation in order to gain further insight into the matter. We have as the result of the self-fertilisation of our hybrids apparently only two kinds of seeds or plants, which we may call D, showing the dominant character, and R, showing the recessive character, in the proportion of 3 D to 1 R. If these plants are again cultivated and allowed to fertilise themselves we find that every one of the R's breeds true, and no matter how many generations we raise they will always remain of the recessive type. These are now called extracted recessives. When, however, we cultivate the plants showing the dominant character in the same way we soon find that though similar externally they are not in reality all alike, for one-third of them will yield nothing but D's, while the remaining two-thirds will yield D's and R's in the same proportions of 3 to 1 as the original hybrid. Moreover, the D's obtained from the one-third will continue to breed true from generation to generation, and do what we will we can never get an R out of them again. They are called extracted dominants.

It is obvious, then, from these experiments that the apparent D's are not all true D's, but that two-thirds of them contain the recessive character in a latent or dormant condition, and are, therefore, still hybrid in composition. If we indicate those which we can thus prove by breeding to contain the latent character by the letters D (R), we can sum the whole story up in the following simple diagram:



Thus we see that from generation to generation of the offspring of the hybrid there goes on a constant sorting out into three categories, the two original parental types and the hybrid form being always produced in definite proportions. If we assume that each kind produces on an average an equal number of offspring, we shall see from the diagram that in the course of a few generations of undisturbed reproduction by far the greater number of the plants will have finally reverted, in equal proportions, to one or other of the original types, but a certain number will always remain in the hybrid condition, and will continue to split up as before in the well-known Mendelian proportions.

We see, then, from Mendel's experiments, that in the case of peas, where one of the two contrasted characters is dominant over the other, the offspring of the first hybrid appear in the proportion of three apparent dominants to one recessive, but that further analysis shows that the real proportion is

1 D: 2 D (R): 1 R.

This proportion has since been observed not only in peas, but in a large number of other cases, including animals as well as plants. It is evidently a phenomenon of very common occurrence, though we cannot as yet say that it occurs universally whenever two forms with contrasted characters are crossed. Moreover, as we have already noticed, the phenomenon of dominance is not always shown, and the hybrid may exhibit a character intermediate between those of the two parents or different from either. The occurrence of the Mendelian proportions, however, is sufficiently frequent to demand explanation, and this explanation we must now seek.

Suppose we take a large number of black and white counters, all alike in shape and size, and after shaking them up thoroughly in a bag, draw them out two at a time without looking. Each pair that we draw out may consist of two whites, two blacks, or a black and white. If we draw out a sufficiently large number of pairs entirely at random in this way and then count them, we shall find that they occur in the proportion

1 B B, 2 B W, 1 W W,

or one all black, two black and white, and one all white, this being, of course, only what is to be expected in accordance with the mathematical law of probability. This is also the same as the Mendelian proportion, and at once suggests that the latter may, perhaps, be explained in a similar way, as the result of random union of characters in accordance with the laws of chance.

We know that each individual plant or animal produced by sexual reproduction is formed by the union of two germ-cells, or gametes, a male and a female. Now these gametes are formed in very large numbers in the parent organism, and if we suppose that each one, whether male or female, contains only one of the two contrasted characters with which we are experimenting, and if we further suppose that they unite at random, male with female, then in accordance with the law of chance we should expect to get in the offspring the proportion, of one with the one character, two with both characters, and one with the other character, exactly as Mendel found in his experiments. There seems to be no other possible explanation of the Mendelian phenomena.

The conclusions to be drawn from these results are of fundamental importance. In the first place, we learn that small individual characters may be separately represented in the germ-cells and separately transmitted from parent to offspring. This indicates that the entire organism may be built up of a number of unit characters, and if we can once establish the general occurrence of such unit characters we shall have taken a long stride towards the understanding of the laws of heredity.

In the second place, we may conclude from these experiments that, as regards the unit characters with which we are dealing, we have a complete segregation amongst the germ-cells or gametes, each of which carries only one of each pair of contrasted characters (technically termed allelomorphs), and in this respect it makes no difference whether the germ-cell be male or female. Thus we arrive at what is sometimes termed the doctrine of the purity of the gametes—purity, that is to say, with regard to each character of any such contrasted pair and without reference to the other innumerable characters which must be represented in the germ-cells in order that the whole complex structure of the organism may be developed from them.

Of course, it is extremely improbable that any two varieties which are united in the formation of a hybrid will differ from one another only as regards one pair of contrasted characters. There will almost certainly be more than one such difference between them, and our experiments will be complicated accordingly.

(To be continued.)

CHIONANTHUS RETUSUS.

It is curious that more fine examples of this ornamental shrub are not met with, considering that it was described by Lindley and Paxton in their "Flower Garden," vol. iii., p. 85, Fig. 273, in 1852, and that some considerable attention was directed to its merits about that time. It is closely allied to the North American Fringe Tree (C. virginica), and is one of the many beautiful Chinese shrubs that owe their introduction to the travels of Robert Fortune. This particular shrub was found by him in a garden in the neighbourhood of Foochow, and he sent it home to Messrs. Standish and Noble, who were responsible for its introduction to commerce in this country about 1850.

Fortune did not find it in a wild state, and he surmised that it had either been introduced to the place where he discovered it from a more northern part of the empire, or from Japan. Later collectors have, however, found it wild in both countries. It is a strong-growing bush, with large, more or less ovate, or obovate, hairy, deciduous leaves, and snow-white, fragrant flowers, which appear during the latter part of May and early June, in slender, terminal panicles.

It is not an easy plant to propagate, except by means of seeds, though it will root from layers. It has also been increased by grafting on to allied genera, such as olea and ligustrum. Ordinary loamy soil suits it, and when once established it grows fairly rapidly. It has also been known under the name of C. chinensis, a name given by Maximowicz.

W. D.

Mothers' Day Celebration in America.—Early in May an interesting celebration took place in a large number of towns in the United States, and it was a celebration in honour of the mothers of the nation. In most cases, the Mayor of the town fixed a certain day for the celebration, mostly a Sunday, and called upon every man and boy to wear a white flower in his coat on that day in honour of his mother. The men folk could not wear flowers without providing their lady relatives and friends with some also, and so the celebration proved a pretty as well as a charming one, and brought no small gain to the florists.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY COMING OF AGE SHOW.
SOPHIA GARDENS, CARDIFF.
WEDNESDAY and THURSDAY, July 21st and 22nd, 1909.
Most liberal prizes for this show.
MONEY, PLATE, etc., Amounting to about £400.
Many special features this year.
Schedules free to any address.
Mr. A. MAURICE BAILEY, Secretary.
24, Duke Street, Cardiff.

CHESTERFIELD HORTICULTURAL SHOW, QUEEN'S PARK.
WEDNESDAY, 28th July, 1909.
Separate Marquee for Staging and Exhibiting Roses.
Schedules on application.
CHAS. WM. HADFIELD, Secretary.

HANLEY PARK, STAFFORDSHIRE.
July 7th and 8th, 1909.

THIRTEENTH GREAT
ANNUAL FLORAL FETE.
£650 in Prizes. Silver Cups, Gold and Silver Medals.
SILVER CHALLENGE CUP, VALUE £10 10s.
offered for TRADE EXHIBIT (for particulars, see page 10 in Schedule).
Valuable Special Prizes offered by the principal firms in England.
The Railway Companies will convey Exhibits at one fare for the double journey, provided they remain the property of the Exhibitors.

Schedules post free on application to—
WM. POULSON, Secretary.
Town Hall, Hanley.

RICHMOND HORTICULTURAL SOCIETY.
THE THIRTY-FIFTH GRAND ANNUAL SHOW
will be held in
THE OLD DEER PARK, RICHMOND,
On WEDNESDAY, 30th June.
Valuable Money Prizes. Silver Challenge Cups for Roses and Fruit.
Entries close 23rd June.
W. J. COOK, Hon Sec.
Holmsley House, Richmond, Surrey.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

On June 8 the Royal Horticultural Hall was once again packed with exhibits, and hardy flowers were abundant. The latter were good, but it became tiresome to find group after group made up of pretty much the same kinds and varieties of herbaceous and [illegible] subjects. Many trade growers show very little initiative in their displays, as banks of flowers in season, and as many as can possibly be stowed into the space allowed appear time after time.

FLORAL COMMITTEE.

Some wondrously beautiful long-spurred aquilegias were most tastefully displayed by Messrs. Dobbie and Co., Rothesay, who had a charming exhibit of these elegant flowers in a great variety of colours. A pink and [illegible] variety, a golden-yellow, a blue and white, and a purple and yellow, were forms that stood out as specially attractive. This firm also showed Mrs. A. Ireland, The King, [illegible] Cautley, Mid Blue, and Helen Lewis sweet peas. In Messrs. H. B. May and Son's large group the ferns were the chief attraction, and here the gymnogrammas were specially noteworthy. There were also standards of Pelargonium Clorinda, abutilons, [illegible] swainsonias, and the whole made an interesting display. Messrs. Paul and Son, The Old Nurseries, Cheshunt, submitted a group of cut sprays of garden roses, such as [illegible], R. Harrisoni, Trier, Austrian Copper, Xanthina, Altaica, Double Scotch, lutea, and other species and varieties.

A bold bank of pyrethrums, poppies, lupins, eremuri, and other popular hardy flowers was arranged by Mr. G. Reuthe, Keston, Kent, who also had trusses of Rhododendron grande, R. Keysi, and numerous flowering plants of Primula Sikkimensis, Cypripedium macranthum, etc. The Guildford Hardy Plant Co., Guildford, set up a selection of hardy flowers. Messrs. Bakers, of Codsall, Wolverhampton, showed a very bright group of a fine strain of long-spurred aquilegias, and a selection of Oriental poppies and pyrethrums. Roses were again delightfully shown by Mr. G. Mount, of Canterbury, who had tall pillars of Blush Rambler, Jersey Beauty, White Dorothy, and Gardenia, the latter a very pretty yellow bud. Among cut flowers Lady Ashtown, Mrs. David McKee, G. C. Waud, Captain Hayward, Mrs. W. J. Grant, Mdme. Melanie Soupert, Mdme. Ravary, and Mildred Grant were the chief varieties.

Some magnificent flowers of both double and single begonias were shown on boards by Mr. A. L. Gwillim, Cambria Nursery, New Eltham, Kent. The single blooms were of enormous size, and quite the finest we have seen for a long time. Messrs. Gunn and Sons, Olton, showed their beautiful Viola cornuta purpurea and a few good violas. Hardy flowers were extensively and well shown by Messrs. George Bunyard and Co., Lim., Maidstone, whose chief attractions were Lupinus polyphyllus roseus, single pyrethrums, Oriental poppies, a great variety of heucheras, and a selection of German irises. In the centre of the hall Messrs. Jas. Carter and Co., Holborn, displayed splendidly-flowered plants of their excellent strain of gloxinias and streptocarpuses, the former proving a great attraction with their big velvety blooms.

Mr. G. Prince, Oxford, showed a pretty group of roses, and staged the Austrian Copper and Austrian Yellow in great style, as well as Marie Van Houtte and Souv. de S. A. Prince. Messrs. H. and W. Evans, Llanishen, Cardiff, contributed a display of popular kinds of hardy flowers. Lupins, an array of single and double herbaceous pæonies, and a set of very beautiful single and double pyrethrums were boldly staged by Messrs. Kelway and Son, Langport. A fragrant and very pleasing exhibit of well-grown perpetual carnations and sweet peas came from Mr. Paskett, gardener to E. J. Johnstone, Esq., Burrswood, Groombridge. The quality and colouring of the carnations were first-rate, and such sweet peas as Mrs. C. W. Breadmore, Lord Nelson, Audrey Crier, Primrose Spencer, Princess Victoria, Helen Lewis, and a mauve variety named Burrswood, were of great excellence.

A beautiful bank of finely-grown perpetual carnations was set up by Mr. C. F. Waters, Balcombe, Sussex, whose vases of Cecilia, Mrs. Lawson, Victory, Enchantress, and Mrs Burnett were greatly admired. Poppies, irises, lupins, and pyrethrums formed the bulk of a display of hardy flowers shown by Messrs. G. Jackman and Son, Woking. Mr. W. H. Page, Tangley Nurseries, Hampton, filled a whole table with great stands of perpetual carnations and groups of Peach Blossom spiræas, over a groundwork of Countess de Grey ivy-leaved pelargoniums, the latter a new pink variety. The central sheaf of Lilium longiflorum was very fine. Messrs. G. and A. Clark, Dover, made up a bright and effective display with a selection of pyrethrums, lupins, poppies, anchusas, liliums, and irises, and other good things, and they showed Geum coccineum var. Mrs. J. Bradshaw (A.M.), a big scarlet double form.

The eremuri in Messrs. W. Cutbush and Son's group of hardy flowers were very bold and stately, the pink of E. robustum showing up well with the yellow of E. Warei and E. Bungei. Other good things were the water lilies and two fine bunches of Anemone sulphurea, a lovely species with big sulphur-yellow blooms. Messrs. Cutbush and Son had also a big display of carnations and flowering shrubs tucked away in one of the annexes; the carnations were very fine, and needed a better place to display their charms. Mr. Chas. Turner sent a goodly set of poppies.

Very brilliant were the splendid spikes and flowers of cannas from Messrs. H. Cannell and Sons, Swanley, a firm that manages these gorgeous subjects splendidly, and always shows a good selection. The useful Zenobia speciosa, with its lily-of-the-valley-like flowers, was largely and well shown by Mr. L. R. Russell, Richmond. Miss Hemus, Upton-on-Severn, showed some splendidly grown sweet peas, and among newer things were the soft pink Zarina, Paradise Apple Blossom (A.M.), with deep rosy margin and shading; Purple Paradise, deep coloured; the popular Evelyn Hemus, the bright bicoloured Lucy Hemus, and several seedlings.

Mr. Maurice Prichard contributed a display of seasonable hardy flowers, and Messrs. Wm. Paul and Son, Waltham Cross, put up a big batch of the fiery crimson rhododendron Glory of Waltham, a very effective variety. Mr. Amos Perry, Winchmore Hill, showed a splendid lot of pyrethrums, a grand collection of irises, hardy orchids, and poppies. Lupins in great variety, an elegant group of seedling and named varieties of heucheras, stately eremuri, and a selection of liliums and irises, all from Messrs. R. Wallace and Co., made up a brave display that did not lack admirers. Roses were shown by Messrs. B. Cant and Sons, Colchester, but the flowers of the species and garden varieties were bunched rather tightly together; Tausendschon was very fine.

Mr. W. J. Godfrey, Exmouth, contributed a big group of Oriental poppies, showing very distinct art shades of these big flowers. Some of the brown, red, and grey shades were particularly good, as also were the pale salmon and rosy tints. Messrs. J. Cheal and Son, Crawley, staged a group of flowering shrubs, their Cytisus scoparius Lemon Queen being a very fine thing; at one end of the display the firm's pink lupin was a fine feature. Gerbera Jamesoni was well shown by Messrs. Stuart Low, and Co., Enfield, as well as schizanthuses and a collection of cut perpetual carnations. Messrs. T. Rochford and Sons, Broxbourne, submitted the pretty Araucaria excelsa Silver Star (A.M.), with pale creamy green tips to the branches; and Polypodium glaucum crispum (A.M.), a handsome fern. Mr. N. Harwood, Colchester, and Mr. Elliott, Stevenage, both staged groups of hardy flowers.

Messrs. J. Veitch and Sons, Chelsea, had some very interesting hybrids between their fine gloxinias and Gesnera Reginæ; these have erect flower stems, and semi-drooping flowers of purplish hue, and nearly all with a white throat. This firm had a lovely lot of gloxinias in batches of a colour or variety, and they were fine as thus shown. The Messrs. Veitch also set up a selection of flowering shrubs, including rhododendrons, viburnums, syringas, weigelas, Cornus Kousa, etc. The beautiful and elegant Calceolaria Clibrani was well shown by its distributors, Messrs. Clibrans, Altrincham, smothered with yellow flowers. Very beautiful were the perpetual carnations shown by Mr H. Burnett, Guernsey, whose blooms of Enchantress and Marmion were magnificent. Messrs. Barr and Sons, Covent Garden, contributed a collection of hardy flowers, in which the varieties of Iris sibirica were very charming.

Alpines were delightfully shown by Messrs. T. S. Ware, Feltham, whose dianthuses, gentians, aubrietias, saxifragas, Aster alpinus, Arnica montana, Gaultheria procumbens, and Calceolaria polyrhiza were very pretty. Some bright hybrid dianthuses, Lady Dixon and an unnamed bluish-pink variety, were well shown by Mr. James Douglas, Edenside, Bookham.

ORCHID COMMITTEE.

Mr. White, orchid grower to Sir Trevor Lawrence, Bart., Dorking, showed the bright Dendrobium Jerdonianum (Cultural Commendation), Lælio-cattleya Feronia (A.M.), Angræcum expansum (B.C.), and Cirrhopetalum vaginatum (B.C.). Mr. H. A. Tracey, Twickenham, sent Oncidium Batemannianum, Odontoglossum eximium, and a fine white form of Cattleya Mossiæ. From Lieut.-Colonel Holford's collection at Westonbirt, Mr. H. Alexander brought up the splendid Cattleya Mossiæ A. Dimmock, with huge lip (A.M.), and L.-c., Mikado (F.C.C.), with a yellow flower.

Odontoglossum amabile Fowler's var. (A.M.), with ten grand flowers, rosy with chocolate marks, gained a F.C.C., as shown by Mr. Davis, gardener to J. Gurney Fowler, Esq., South Woodford. Odontoglossum Cobbianum, a fine Harryano-crispum cross, was shown by W. Cobb, Esq., Normanhurst, Horsham. The Hon. Mrs. Foley Packham, Fordingbridge, showed an unnamed Lissochilus, with a tall spike of large rosy flowers —very pretty.

Messrs. Stuart Low and Co., Enfield, had a large group of orchids, wherein Cattleya Mendeli, C. Mossiæ, and odontoglossums were the leading features. Messrs. Sander and Sons, St. Albans, had a batch of the grand Cattleya gigas Sanderiana, varieties of Lælia purpurata, L.-c. Endora, and freely flowered specimens of Cypripedium Curtisi. In Messrs. J. Veitch and Sons' orchid group Disa Luna was prominent, surrounded by Cattleya Mendeli, C. Mossiæ, and pretty varieties of Odontoglossum crispum. Messrs. Charlesworth and Co., Haywards Heath, contributed Odontoglossum amabile, O. Ossulstoni, O. ardentissimum, L.-c. Fascinator and the chaste Odontoglossum Armainvillersense.

H. S. Goodson, Esq. (gardener, Mr. G. Day), showed a fine group of orchids that contained Odontoglossum crispum The Czar, O.-c. Pres. Fallieres, Miltonia Bleueana, Cymbidium Huttoni, and numerous masdevallias and cattleyas. Mr. F. McBean, Plumpton, sent some choice odontoglossums, and Messrs. J. and A. McBean, Cooksbridge, showed some very fine forms of Odontoglossum crispum. Mr. Maurice Mertens, Ghent, brought over some delightful odontoglossums. Mr. A. W. Jensen, Lindfield, sent odontoglossums, cattleyas, and "Butterfly" orchids—Oncidium papilio.

FRUIT AND VEGETABLE COMMITTEE.

A remarkably fine exhibit of ripe fruit, admirably set up by Mr. J. Gibson, gardener to the Duke of Portland, Welbeck, was one of the great attractions of the show. Everything was magnificently grown, and the peaches and nectarines, melons, and cherries were very fragrant and luscious. The melons were Sutton's Superlative, Gunton Scarlet, Best of all, Hero of Lockinge, Royal Jubilee, and Ringleader; Cardinal and Early Rivers nectarines were grand, and so were Bellegarde and Hale's Early peaches, while the cherries—Bigarreau de Schreken, Black Tartarian, Emperor Francis, Bigarreau Jaboulay, Frogmore Early, and Governor Wood were superb in size and colour. Other good dishes were of Royal Sovereign and Gunton Scarlet strawberries, Oullin's Golden Gage plum, and Lady Sudeley apples. A real gold medal display.

Sutton's Latest of All broccoli, a valuable variety, was splendidly shown by Messrs. Sutton and Sons, Reading, and the heads were from a crop practically untouched during the past winter. Miss C. M. Dean, Elmcroft, Nurseries, Westergate, Winchester, showed a dozen and a-half neat specimens of Elmcroft Beauty melons. Messrs. J. and F. Chatfield, Southwick, showed grand Royal Sovereign and Bedford Champion strawberries.

CERTIFICATES AND AWARDS.

First-Class Certificate.—To Lælio-cattleya Mikado, from Lieut.-Colonel Holford, Westonbirt, Gloucester.

Award of Merit.—To Cattleya Mossiæ var. A. Dimmock, from Lieut.-Colonel Holford.

To Lælio-cattleya Feronia, from Sir Trevor Lawrence, Bart., Dorking.

To Odontoglossum amabile Fowler's var., from J. Gurney Fowler, Esq., Glebelands, South Woodford.

To Geum coccineum var. Mrs. J. Bradshaw, from Messrs. G. and A. Clark, Dover.

To Lithospermum prostratum Heavenly Blue, from Mr. Amos Perry, Enfield.

To Sweet Pea Paradise Apple Blossom, from Miss Hemus, Upton-on-Severn.

To Dobbie's long-spurred strain of aquilegias, from Messrs. Dobbie and Co., Rothesay.

To Iris Ed. Michel, from Messrs. R. Wallace and Co., Colchester.

To Scolopendrium vulgare crispum muricato-fimbriatum and S. v. crispum multifidum, from Messrs. H. B. May and Sons, Edmonton.

To Schizanthus Beauty of Trent, from Mr. H. Parr, Trent Park, New Barnet.

To Araucaria excelsa Silver Star and Polypodium glaucum crispum, from Messrs. T. Rochford and Sons, Broxbourne.

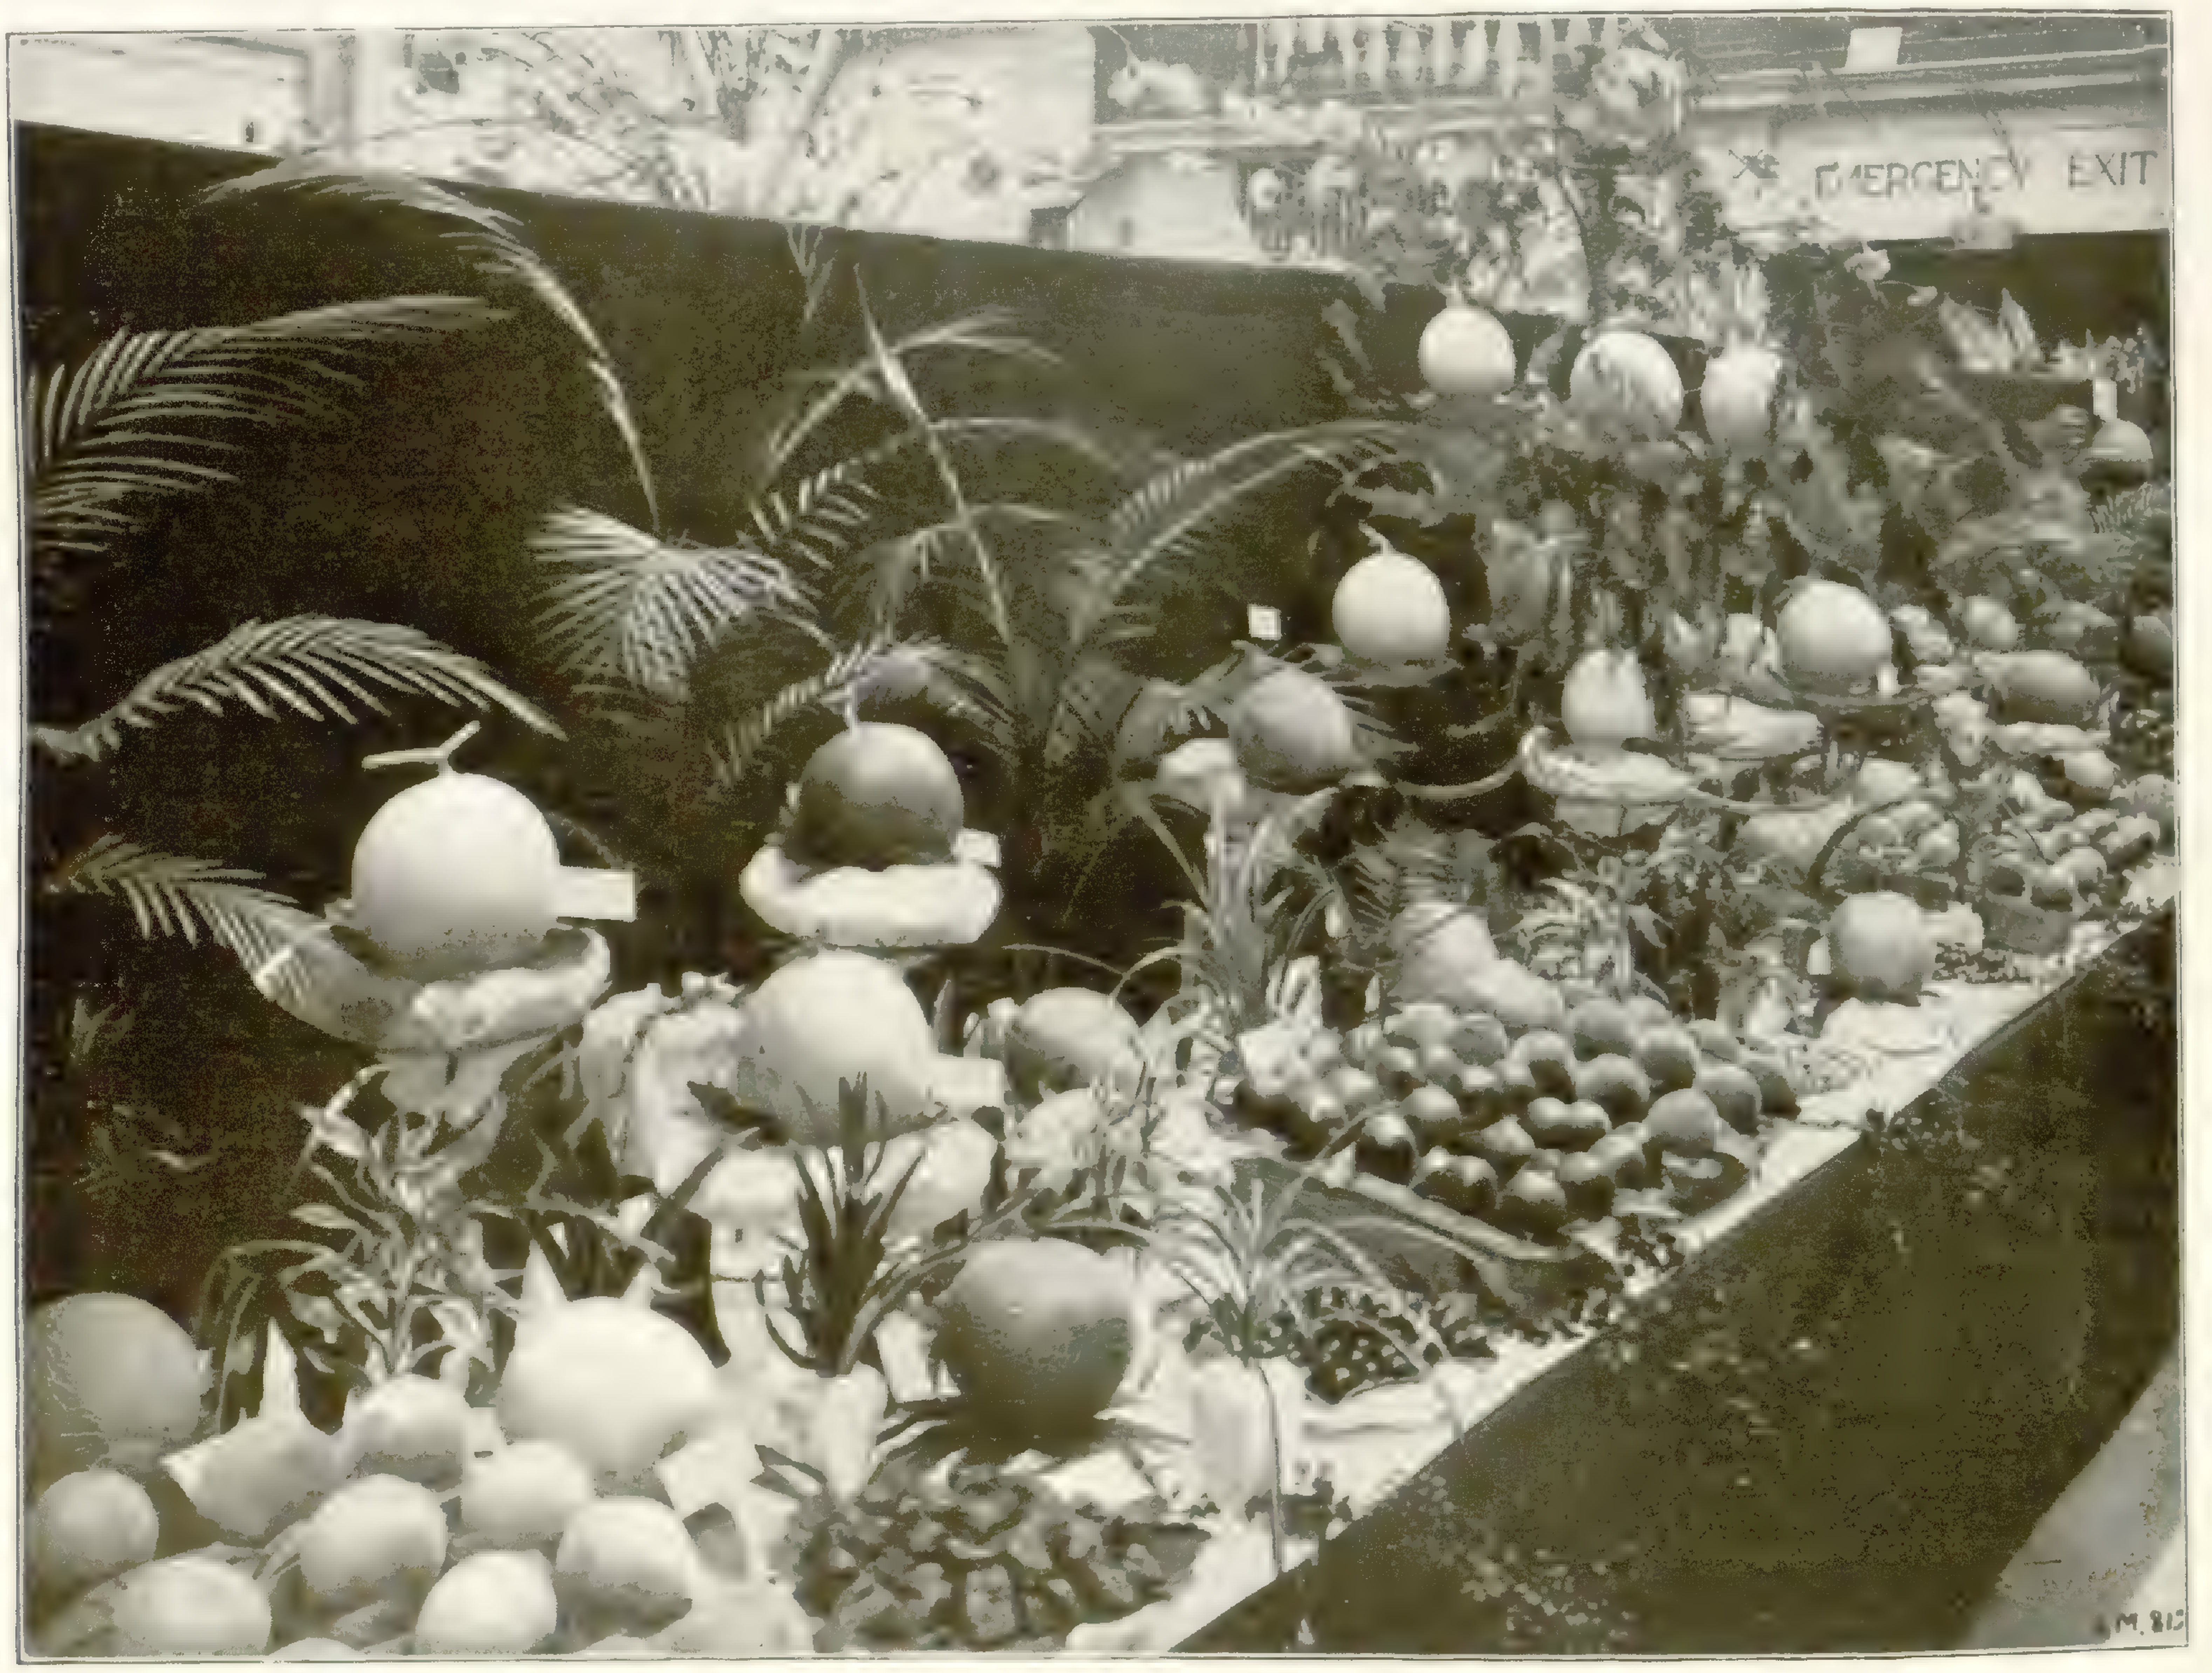
MEDALS.

Gold.—To Mr. James Gibson, gardener to the Duke of Portland, Welbeck Abbey, Notts, for choice fruits.

Silver-Gilt Flora.—To Messrs. Wm. Cutbush and Sons, Highgate, for carnations and hardy flowers; to Mr. W. H. Page, Tangley Nursery, Hampton, for carnations, peas spiræas, etc.; and to Messrs. Jas. Veitch and Sons, Chelsea, for hardy plants and gloxinias.

Silver-Gilt Banksian. — To Mr. Paskett, gardener to E. J. Johnstone, Esq., Burrswood, Groombridge, for sweet peas and carnations.

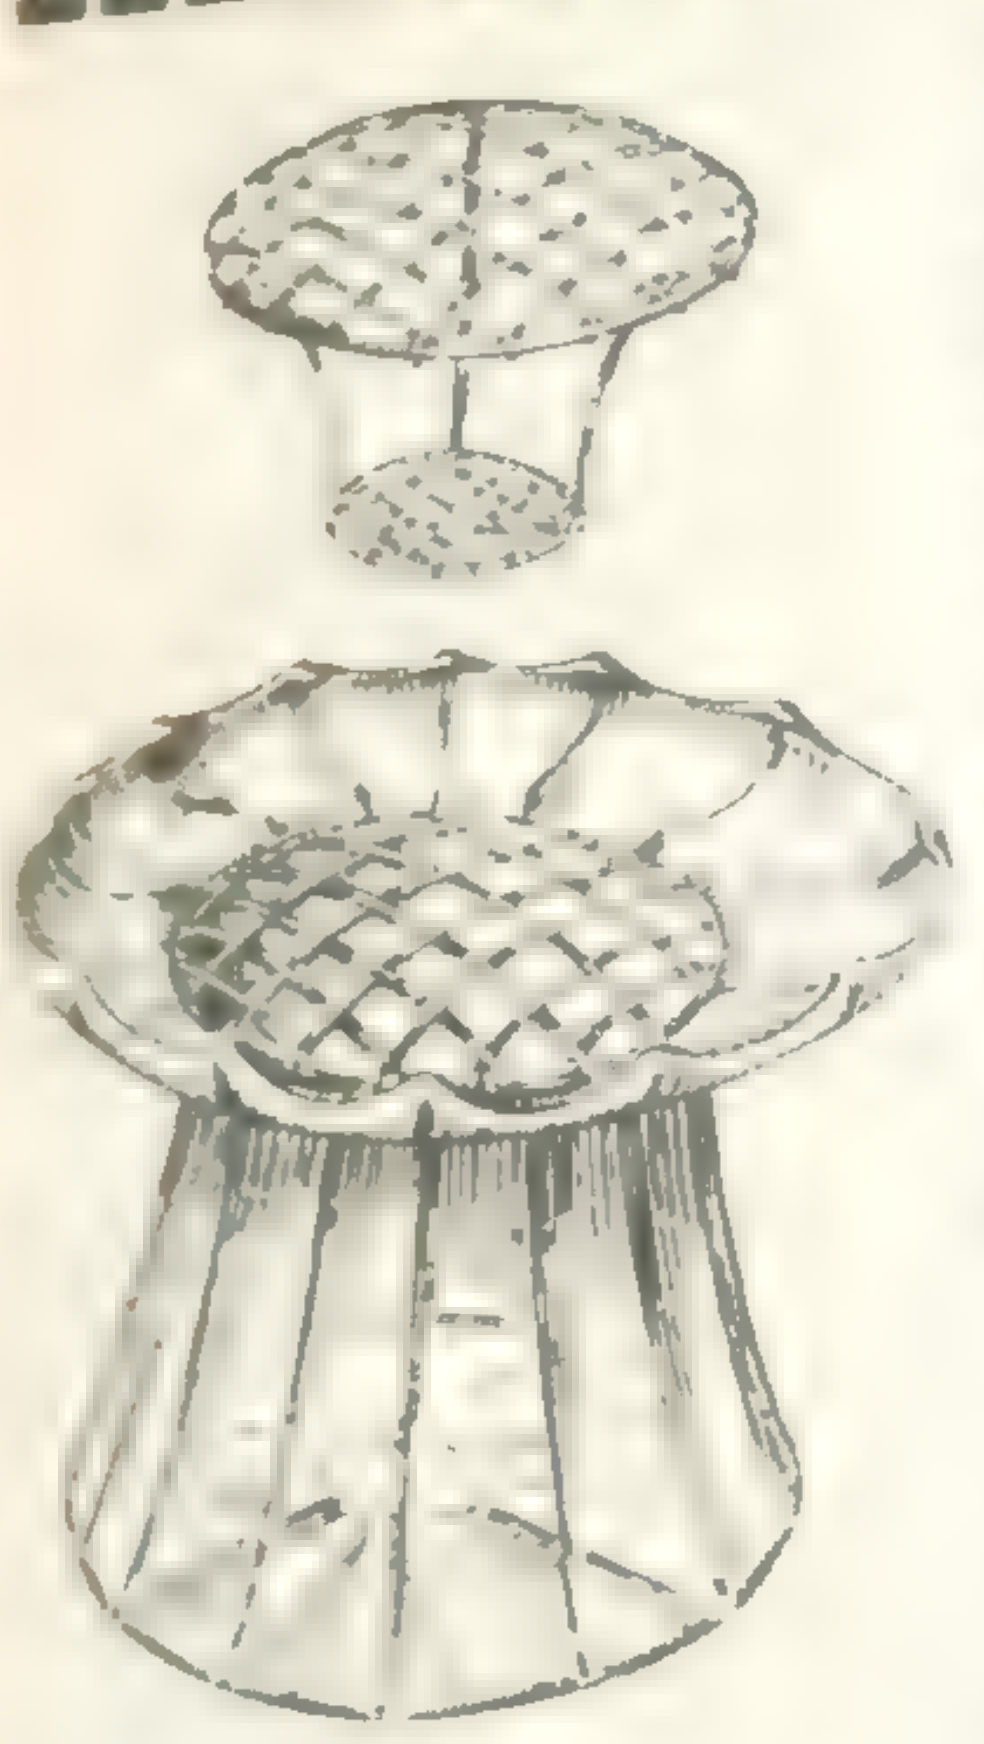
Silver Flora.—To Messrs. H. Cannell and Sons, Swanley, for cannas; Messrs. James Carter and Co., Holborn, for gloxinias; Messrs. Dobbie and Co., Rothesay and Marks-Tey, for aquilegias; Miss Hemus, Upton-on-Severn, for sweet peas; Messrs. Stuart Low



A MAGNIFICENT COLLECTION OF CHOICE FRUITS.

Exhibited at the Royal Horticultural Society's meeting on Tuesday last by Mr. James Gibson, gardener to the Duke of Portland, Welbeck Abbey, Worksop. A Gold Medal was awarded for the collection, which was remarkable not less for tasteful arrangement than for high quality.

ELEGANT & GRACEFUL.



These Rose Bowls are Best English Glass, are made either Green or Crystal, and are fitted with special heavy Brass Wire Covers.

They stand perfectly firm and will please you in every way.

A Lady writes: "I use your Green Bowls for my Frau Karl Druschki Roses. The effect is most lovely."

MELLINGS' PATENT COMBINED
LAWN SPRINKLER & HOSE REEL.

The above is a Circular Brass Tube attached to the inside of the rim of a Gossage Hose Reel and well perforated, producing the effect as illustrated.

THE ADVANTAGES OF THE SPRINKLER ARE:

That the combination is much cheaper than purchasing a Sprinkler and Reel separately.
That it is superior to others, owing to a much better distribution of the water.
That it can be moved about the lawn by pulling the hose without turning the water off, as is necessary with most Sprinklers.
The Reels, being galvanized, will not rust.
There are no loose parts to get lost, and in coiling the hose no part is in the way to detract from the use of the Reel.

Prices:—No 0, **15/9.** No. 1, **18/6.** No. 2, **22/6.**

To be obtained from—

JOHN KNOX & CO.,

and Co., Enfield, for carnations, and one for orchids; Messrs. H. B. May and Sons, Edmonton, for ferns and flowering plants; Mr. G. Mount, Canterbury, for roses; Mr. Amos Perry, Enfield, for hardy flowers; Messrs. R. Wallace and Co., Colchester, for hardy flowers; Mr. H. Burnett, Guernsey, for carnations; Messrs. Charlesworth and Co., Haywards Heath, for orchids; Messrs. Sander and Sons, St. Albans, for orchids; Mr. G. Day, gardener to H. S. Goodson, Esq., Putney, for orchids.

Silver Banksian.—To Messrs. Jas. Veitch and Sons, Chelsea, for orchids; Messrs. Moore and Co., Rawdon, Leeds, for orchids; Messrs. J. and A. McBean, Cooksbridge, for orchids; Mr. A. W. Jensen, Lindfield, for orchids; Messrs. Barr and Sons, Covent Garden, for hardy flowers; Messrs. G. Bunyard and Co., Maidstone, for hardy flowers; Messrs. J. Cheal and Sons, Crawley, for hardy flowers and shrubs; Mr. A. L. Gwillim, for begonias; Mr. M. Prichard, Christchurch, for hardy flowers; Mr. G. Reuthe, Keston, Kent, for hardy flowers; Messrs. T. S. Ware, Feltham, for alpines; Messrs. G. and A. Clark, Dover, for hardy flowers; and to Mr. G. Prince, Oxford, for roses.

Bronze Flora.—To Mr. C. F. Waters, Balcombe, Sussex, for carnations.

Bronze Banksian.—To Messrs. B. R. Cant and Sons, Colchester, for roses.

TRADE NOTES.

The title of Stuart Low and Co. will have a very familiar sound to many of our readers, for the Lows of Clapton and the Royal Nurseries Bush Hill Park, Enfield, have long occupied a prominent position in commercial horticulture. The name, it may be mentioned, comes from one of the many Scotch horticulturists, who settled in England a century or so ago, when the late firm of Hugh Low and Co. was established. In consequence of a dissolution of partnership Mr. Stuart Low, the present head of the firm, takes over the Bush Hill Park Nurseries, of which he has had control for upwards of a quarter of a century, with the entire staff of the late firm. The present head of the firm is the son of the late Mr. Stuart Low, of Clapton, and he is a member of the Royal Horticultural Society's Orchid Committee, and a past president of the Horticultural Trades' Association. While Mr. Stuart Low will take an active part in the general management of the large establishment, the various departments will be in charge of the several managers who have long been associated with the business, chief among them being Mr. Harry A. Barnard, Mr. F. W. Ashton, Mr. Laurence J. Cook, Mr. Montagu C. Allwood, and Mr. G. F. Salman. It is interesting to observe that the staff includes many men who served under Mr. Hugh Low, the grandfather of the present proprietor. With so able and loyal a staff the name of Messrs. Stuart Low and Co. should become in a very short time as well known as that of the old firm of Hugh Low and Co.

Messrs. Joseph Bentley, Lim., of Barrow-on-Humber, Hull, have been granted the Royal warrant of appointment as horticultural chemical manufacturers to the King.

FORTHCOMING ENGAGEMENTS.

MONDAY, June 14.—United Horticultural Benefit and Provident Society.
TUESDAY, June 15.—Royal Meterological Society's Annual Dinner.
WEDNESDAY, June 16.—York Floral Fête and Gala; three days.
THURSDAY, June 17.—Linnean Society Meeting.
TUESDAY, June 22.—Royal Horticultural Society, Committees meet at 12 o'clock; at 3 p.m. the First Masters' Memorial Lecture on "Masters' Vegetable Teratology," by Prof. Hugo de Vries; Scientific Committee at 4 o'clock.
WEDNESDAY, June 23.—Gardeners' Royal Benevolent Institution, Festival Dinner at the Hotel Metropole.
SATURDAY, June 26.—Windsor Rose Show.
TUESDAY, June 29.—Southampton Rose Show; two days.
Brighton Rose Show; two days.
Canterbury Rose Show.

NEW BOOKS.

◆

ILLUSTRATED GUIDE TO THE TREES AND FLOWERS OF ENGLAND AND WALES.

By H. G. Jameson, M.A. (Simpkin, Marshall, Hamilton, Kent, and Co., London, E.C.)

An exceedingly well-prepared book that should be found of much value to those who are engaged in Nature study—as, indeed, to those who take an intelligent interest in trees and plants generally indigenous to this country. The book, we are told in the introduction, is intended to help the ordinary Nature-lover, who may perhaps have little or no knowledge of botany, to find out the names of such trees and flowers as he meets with. With plants, as with human beings, the first step towards friendship, with all its future possibilities of interest and delight, is to learn your friend's name. No doubt, even ignorant people obtain some amount of enjoyment out of Nature, but it makes all the difference to the pleasure of a country walk when on every hedge, bank, and in every ditch we catch sight of familiar acquaintances, which we have learnt to greet by name and recognise as friends.

We fully agree with the views of the author on the desirability of those who take an interest in trees and wild flowers being acquainted with the names of those that come under their notice, and we congratulate him on the success he has achieved in his endeavour to assist Nature-lovers in becoming acquainted with the nomenclature of our native flora. There are, it need hardly be said, several keys to the natural orders, but these are mostly highly technical, and presuppose more botanical knowledge than the beginner has at his command. Hence the value of the present book, for the key is founded on plain and easily-observed characters and such as do not involve dissection, and technical terms have, as far as possible, been avoided. These are points of no small importance to those who are engaged in Nature study, as distinguished from botanical students; and not less important are the numerous illustrations accompanying the text, which help to make its meaning clear at a glance. These figures are necessarily small, and do not pretend to be complete pictures of the plants, but they are remarkable for their clearness, and admirably illustrate the special characters used for the key. The book is at once simple in treatment and scientific in method, and should be in the hands of all who are desirous of becoming acquainted, with the least possible trouble, with the names of their country's trees and flowers.

SMALL HOLDER'S GUIDE.

Edited by T. W. Sanders, F.L.S. (Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.). Price 1s. net.

The editor, in his "Forewords," is careful to point out the necessity of extreme caution on the part of those who have had little or no previous experience in the cultivation of the land in coming to a decision to take a small holding, and thereby at once inspires confidence in the work. It has been too much the practice of late to write of small holdings in such manner as to suggest that it is not necessary to do more than merely tickle their surface with the hoe to make them "laugh with joy," or, in other words, to yield prodigious crops that will give a big return to the holder. Such statements at once suggest to those who are acquainted with the subject that the writers have but little practical knowledge of small holdings and their management, and that, consequently, they cannot be regarded as guides that may be followed without doubt or question. The book before us is wholly free from rash statements and alluring figures, but it takes a strictly business view of the small holding, and states in a very definite manner that those who enter upon small holdings must have some acquaintance with the cultivation of land, and adequate capital. It further emphasises the necessity of close attention to the multifarious details incidental to the growth and the disposal of the various products.

These points having been made quite clear, the editor proceeds to place his readers in possession of the information essential to the successful management of small holdings of varying areas. As indicating the comprehensive character of the book, it may be mentioned that the book is divided into four parts. The first part is devoted to the prospects for small holdings, and the land best suited for them; in the second part the types of holdings are fully dealt with; in the third part the various industries likely to give an adequate return are described, and the fourth part is devoted to miscellaneous matters.

Comprehensive in scope, and thoroughly trustworthy, the "Small Holder's Guide" should prove of much value both in the selection and management of small holdings.

PRONUNCIATION OF PLANT NAMES.

(The Gardeners' Chronicle, Lim., 41, Wellington Street, Covent Garden, London, W.C.). Price 1s. net.

The pronunciation of plant names is beset with so many difficulties that our contemporary has rendered horticulturists a service of much value by the publication of this admirably-prepared brochure. The list makes no pretence to be exhaustive, but it includes most of the difficult generic names of cultivated plants, and is sufficient for all practical purposes. In the preparation of the list the endeavour has been made to keep the pronunciation as far as possible in conformity with the derivation of a word. But it has been found necessary in some cases to admit the right of ordinary usage to carry weight, even when it contradicts the strictly correct form as dictated by etymological principles. The general use of the book would do much to secure uniformity in the pronunciation, and, what is of even greater importance, secure correct pronunciation of names that at present are pronounced by some without regard to etymological principles or common usage.

THE GOAT.

By J. T. Bird (Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.). Price 1s. net.

A useful handbook on the subject of the goat, which would appear to be rapidly rising in favour, and likely to attain to a high degree of popularity with the extension of small holdings. The author has dealt with his subject in an interesting and comprehensive manner, and has placed his readers in possession of the information that is necessary to achieve success in the breeding and management of goats, which have much value for contributing to the milk supply.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

PLANTING OUT ANNUALS. — S. G., Farnham: There should be no delay in planting out both half-hardy and hardy annuals, as the season is now well advanced, although at the time of writing the weather is cold. If the plants have been duly hardened set them out at once, taking care that they are well watered an hour or two previous to removal. If you have had plenty of rain lately it will hardly be necessary to water the ground or to water the plants as soon as planted, though the latter practice is to be commended unless rain is imminent, as it settles the soil firmly about the roots. Plant in good groups, and do not on any account plant in a series of regular lines, or set the plants out singly, so as to spread a kind or variety over the whole length of the border.

CATERPILLARS IN WEB NESTS. — M. E. W., Chesterfield: The web nest and caterpillars sent are those of the Lackey Moth (Bombyx neustria), a pest that does a great deal of harm to apples, pears, thorns, damsons, and even elm and birch. The caterpillars eat the foliage and return to their web nests at night or during wet and dull weather. It is in late evening or during wet weather that one may with advantage cut away these nests, with, perhaps, a piece of growth, or some leaves attached, because then the caterpillars are at home. Have some hot brine or other strong mixture into which to drop the nests of caterpillars as soon as cut out. Winter spraying and keeping the ground beneath the trees well cultivated, are means towards preventing subsequent attacks.

LONG-NECKED ONIONS. — B. W. W., Weybridge: We have submitted the specimens to a well-known grower and exhibitor, and he agrees with us that excessive feeding with nitrogenous manures during the very early stages of growth is the cause of the trouble. The matter appears to have gone too far now to be remedied.

TOMATOES IN FRAMES. — S. D. R., Chertsey: When tomatoes are planted out in frames, and allowed to grow upright, instead of being planted in the front and trained along rods towards the back, there comes a time or times when the light of the frame becomes troublesome, as it is necessary to elevate it to prevent the plants becoming damaged by contact with the glass. If the frames are against a wall or along the front of greenhouses the matter is not difficult, because, by means of a strip of wood about four inches wide nailed along the wall in front, the back of the light can be raised by ledging it upon the wood. The front of the light is easily managed, as each light may rest on a tall pot, or a strip of wood may be nailed to the front edge of the light, so as to raise it to the desired height. By these or other means the lights can be kept over the tomatoes for the greater part of the summer it will be a distinct advantage, but they must be elevated as the plants grow, and they must be tilted so as to throw off rain, and so as to catch as much sunlight as possible. Great care must be taken to make the lights secure, or a storm of wind may at once wreck both lights and tomatoes. There is one considerable disadvantage associated with the use of garden lights in this fashion, and that is, the staking of the plants cannot be done once and for all; there must be two stakings, so that the stakes need not be raised to the highest

limit until the last moment. It will be a good plan to limit the growth of the plants to a certain height, allowing for each one to carry four or five trusses of fruits.

EARTHING POTATOES.—R. R., Derby: Earthing up potatoes should be done in two operations, first of all hoeing between the rows and sets, and thoroughly cleaning the ground. Earth up lightly on the first occasion, and then, after an interval of ten days or a fortnight complete the work. In your case there seems no need for the application of a fertiliser, but if you have plenty of wood ashes at hand, give the plot a liberal dressing just before the first earthing up. Earthing up exposes a large surface of soil to the influence of the sun, and consequently means warmer soil for the tubers; it also serves to throw off heavy rains, and, in the case of a wet season, when potato disease is rampant, potatoes grown in rows well apart, and well earthed up, come out much better than those unearthed and planted thickly, because the spores of the fungus fall, largely, into the depressions between the rows.

SEED VESSELS ON RHODODENDRONS.—C. B., Bayham: It is very important that in the case of all choice rhododendrons the seed vessels should be picked off as soon as formed, because seed production is a strain upon the plant, and a quite unnecessary strain where seeds are not required. The strain of seed-bearing weakens the new growths that start away just below the flower truss, and consequently the prospects for a display the following season are greatly reduced. If a man cannot be spared for the work then set an intelligent boy to remove the newly-forming seed vessels, first explaining to him the reason for their removal, and the great gain the plants will derive from his work.

DAMAGED CUCUMBERS. — T. S. W., Walsall: The disfigurement of the cucumbers is due to the ravages of slugs. It is probable that the fruits were in contact with the soil, or with a pot plant beneath them, for slugs seldom crawl along the rough stems of the cucumber. Set traps of bran or lettuce leaves for the slugs, and dust old soot about the soil and staging; further, see that every cucumber hangs clear of the soil or other plants.

NAMES OF PLANTS.

D. H., Caterham.—Pyrus Scheideckeri.

G. S., Ryde.—1, Pyrus Malus; 2, Arabis albida fl.-pl.; 3, Aster alpinus altaicus.

D. W., Wellingborough.—Evidently Cerasus Padus, but the wet moss had rendered the specimen unfit for proper determination.

A. D., Helensburgh: 1, a form of Crataegus pyrifolia; 2, Cerasus pseudo-cerasus; 3, Cerasus Padus; 4, Amelanchier canadensis ovata; 5, mesembryanthemums, species not recognised.

CATALOGUES RECEIVED.

JOHN JEFFERIES AND SON, LIM., CIRENCESTER.—A very complete list of bedding plants, carnations, dahlias, fuchsias, etc.

JAMES VEITCH AND SONS, LIM., CHELSEA.—An excellent and exceedingly well got up catalogue of indoor plants, freely illustrated with views in the Chelsea nurseries, and of new, rare, and beautiful plants.

DICKSONS, CHESTER.—A pocket list of summer bedding and border plants, and florists' flowers.

GEO. COOLING AND SONS, BATH.—A useful and handy catalogue of roses in pots, and of clematises, carnations, dahlias, and climbing plants.

WM. PAUL AND SON, WALTHAM CROSS.—This Catalogue of new roses is in the usual attractive style of the Waltham Cross firm. It is well illustrated, and contains a fine coloured plate of the new H.T. rose Margaret.

JAS. STREDWICK AND SON, ST. LEONARDS-ON-SEA.—A freely illustrated catalogue of dahlias, the cactus varieties receiving great prominence.

JAMES BACKHOUSE AND SON, LIM., YORK.—Under the title of "Gardening Under Cover," the York firm has issued a very interesting catalogue of stove and greenhouse plants. The trend of floral fashion is made evident by the prominence given to perpetual carnations.

WM. ARTINDALE AND SON, NETHERGREEN, SHEFFIELD.—A very useful and comprehensive catalogue of hardy plants and flowers, freely illustrated, and with a coloured plate of three new bedding violas.

MARKETS.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WEED KILLER used once a year "No weeds can live." RICHARDS' ARSENATE OF LEAD for all leaf-eating insects. CUCASA (fungicide), the finest preparation of copper ever offered to gardeners. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

Dissolution of Partnership.

NOTICE is HEREBY GIVEN that the PARTNERSHIP heretofore subsisting between us the undersigned, Stuart Henry Low and Edward Valentine Low, carrying on business as Nurserymen and Orchid Growers at The Royal Nurseries, Bush Hill Park, Enfield, Middlesex, under the style or firm of HUGH LOW and CO., has been DISSOLVED.

The said Stuart Henry Low will in future carry on business at Bush Hill Park aforesaid, under the style of "Stuart Low and Co.," and the said Edward Valentine Low will carry on business at The Orchid Nursery, Vale Bridge, Haywards Heath, Sussex, under the style of "Edward V. Low." All debts due to and owing by the said late firm of Hugh Low and Co. up to and including June 2, 1909, will be received and paid respectively by Frederick Orlando Collier, of 15, 16, and 17, Eldon Street, London, E.C., chartered accountant.

Dated this 15th day of June, 1909.

STUART H. LOW.
EDWARD V. LOW.

At Greatly Reduced Prices.

INTRODUCED 1885.

This well-known invention for the entire eradication of all pests infesting vegetation under glass is now manufactured in a more simple and reliable form. The small candle (which will be found packed with each Cone) has only to be lighted, and placed on the ground in the centre of the Cone Frame, to produce immediate results. Nothing in the market can equal it for efficacy and cheapness.

Cone No. 3, for a well-secured house of cubic 2,000 to 2,500 feet, 1/- each.
Cone No. 2, for a well-secured house of cubic 1,000 to 1,200 feet, 8d. each.
Cone No. 1, Carbon, for frames of cubic 100 feet, 6d.

Full Directions accompany each Cone.

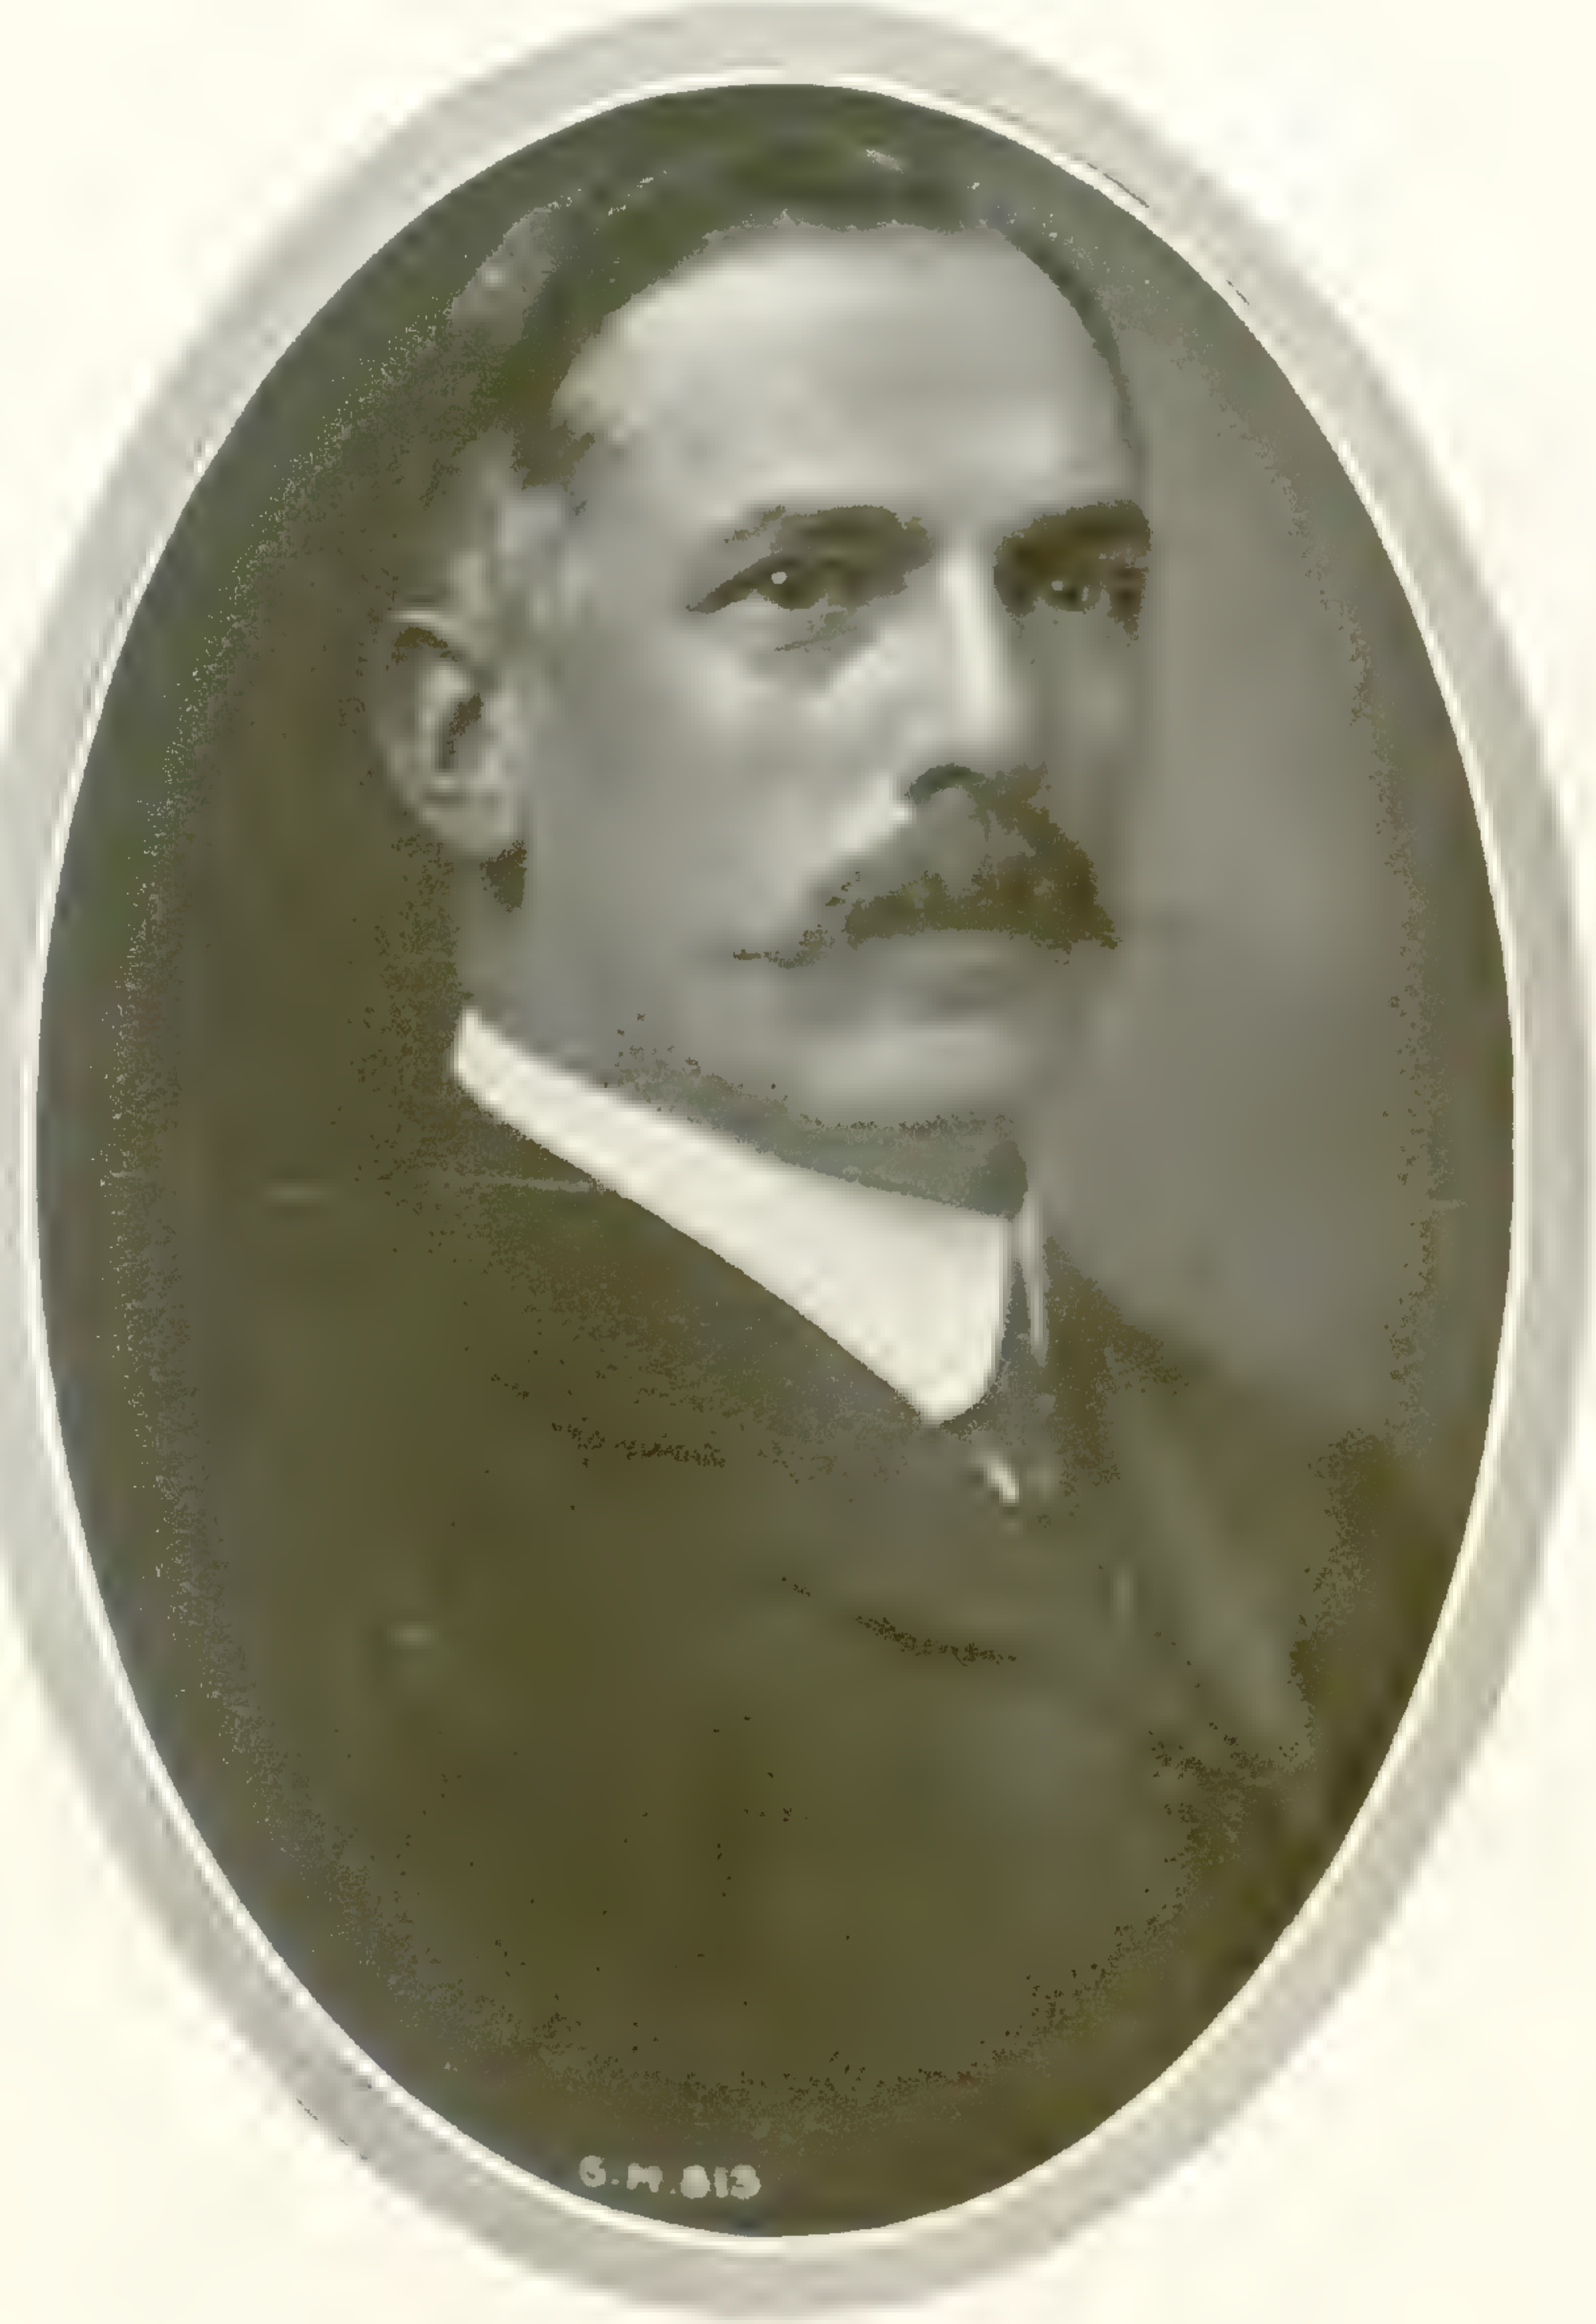
THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Rambling Roses.



MR. FRANK CANT.

Roses that are sufficiently rampant in growth to justify their inclusion among the varieties popularly known as ramblers, possess so great a value as aids in beautifying the garden during the summer months as to render it difficult to place too high an estimate on their usefulness. Free in growth, elegant in habit, profuse in flowering, and attractive in colour, they readily lend themselves to artistic treatment in the creation and improvement of garden scenery. Where the space is sufficient to allow of their being utilised on a somewhat liberal scale, it will be found a comparatively simple matter to produce a feature in the garden that by reason of its distinctiveness and beauty will at once claim attention, and add immensely to the general attractions. In great gardens they may be successfully utilised in the furnishing of pergolas and pavilions designed on a large scale; in clothing trees and large shrubs that are showing signs of decrepitude from old age or other cause; in covering widespanning arches and trellises of large areas; and trailing over high and more or less rugged banks. In small gardens they will be found equally useful for pergolas and pavilions, and for arches and trellises of dimensions suited to the area occupied. Very effective also are they when trained up poles of larch and other wood, trained along loosely suspended chains to form festoons of flowers and foliage, and when grown as weeping standards on stout stems, from seven to nine feet in height. These latter methods of training are adapted to gardens generally, it being simply necessary that when the garden has a small area they should not be so freely utilised as to unduly predominate. There is probably no way in which the charms of rambling roses can be displayed to greater advantage than in a garden designed on more or less natural lines, as in the case of the one in the Royal Gardens, Kew, which, we need hardly say, is now daily increasing in interest and beauty. The rambling rose garden is unfortunately only adapted to the conditions that obtain where the grounds are extensive, but there are many hundreds, possibly thousands, of gardens wherein sufficient space could without difficulty be provided for the display of a representative selection in a natural manner. It need not be a very costly undertaking, provided the contour of the ground and the character of the soil are such that considerable quantities of the latter have not to be moved, and, what is still more important, have not to be brought from considerable distances. What was done at Kew in the formation of the garden of rambling roses is especially worthy of consideration, as an example that might in many cases be followed. A depression of some length, flanked on either side by groups of evergreen and deciduous shrubs, and occupying a position in a remote part of the grounds, was selected. Irregular banks, rising to a considerable height, were formed with soil taken out of the lower part, and in their support tree stumps of large size were freely used. Ample space was provided by means of bays of varying size for the planting of roses at the foot of the banks, and the spaces provided on the banks at various heights for the reception of roses were large enough to contain a good body of soil. This latter is a point of first-rate importance, for without an ample root run in soil rich in nutrient matter it is impossible to maintain rambling roses in a robust state of health, which, it need hardly be said, is so essential to abundant flower production. We cannot, of course, do more here than indicate in the briefest manner the lines on which the rambling rose garden should be formed. We therefore advise those who are interested in the matter, and have an opportunity for so doing, to visit Kew within the next month or so, and make a careful study of the garden and its occupants. Those who are unable to visit Kew will obtain a fairly good idea of the general character of this garden by imagining a comparatively broad and slightly winding valley, flanked by irregular slopes, rising in some parts to a height of nine or ten feet, and clothed with roses. In thus referring to rambling roses, we must not be understood as implying that they should be so largely grown as to render it necessary to reduce the area devoted to the hybrid perpetuals, hybrid teas, the teas, Chinas, and other free and continuous flowering varieties. So far from having a desire to do this, we feel it necessary to point out that in some gardens the ramblers are being so largely planted as to suggest that the owners regard them as far superior to other sections. It should be remembered that, while the ramblers may, by a judicious selection of varieties, be had in bloom over a considerable period, they cannot compare, as regards continuity of flowering, with the sections mentioned as being grown in dwarf form. No really useful comparison can be instituted between the dwarfs and the ramblers, and what we suggest is the taking advantage of the aid the several sections are able to render in beautifying the garden, and the planting of them in due proportions. The multiplication of rambling roses is proceeding so rapidly that raisers in America and on the Continent will be well advised to take greater care in the selection of varieties for distribution, lest the rose market be flooded with varieties that are second-rate, or wanting in distinctiveness, and growers become so disgusted that they will not buy the new introductions, whatever their merits. Already the number available is so large as to give rise to some perplexity, and it would be an immense advantage if the National Rose Society could, in co-operation with the Royal Horticultural Society, or alone, carry out a comprehensive trial of rambling roses. This would take time, and it is therefore gratifying to know that the British nurserymen restrict the varieties in their catalogues to a few of the best.

Mr. Frank Cant, whose portrait we have the pleasure of giving in this issue, is so well known to all who take an interest in roses that it is quite unnecessary we should do more than refer in the briefest manner to his remarkable success as a professional rosarian. During the thirty years or so that have elapsed since Mr. Frank Cant started the Braiswick Rose Gardens, Colchester, he has enjoyed uninterrupted success. He has been successful in winning the challenge trophies at the Metropolitan and provincial exhibitions of the National Rose Society a goodly number of times; he has won the society's gold medal for a new rose, the variety being the exquisitely beautiful tea-scented Lady Roberts, and the number of blooms selected from the Braiswick rose boxes for medal awards as the best in the respective sections in the trade division must be very large. In addition to the trophies and medals that have been won by Mr. Frank Cant, prizes well nigh innumerable, and including a large number of challenge and other silver cups, have been awarded him at the exhibitions of the National Rose Society and other competitive gatherings during the past thirty years, for he has been a keen competitor, and has been equally successful in the cultivation and exhibition of all classes of roses. While annually adding to his list of successes in the exhibition tent, he has not been less successful in meeting the demands made upon his resources by the rose-loving public, and as the result there has been a steady and continuous expansion in the area of his cultures. The business ability so evident in the management of the Braiswick establishment has obtained for Mr. Frank Cant a foremost position in the councils of the National Rose Society, and no member of committee could well be held in greater respect. It may be added that he is not less highly esteemed at Colchester than in London and at other centres where rosarians do congregate; and we have evidence of this in the fact that some years ago his neighbours persuaded him to devote some part of his leisure to municipal affairs, and that he has represented his ward until the present time.

Darwin Centenary Celebration.—In connection with the celebration at Cambridge, on the 22nd, 23rd, and 24th inst., of the centenary of the birth of Charles Darwin, a number of works of considerable importance are being published under the direction of the Syndics of the University Press. The most noteworthy of these works is that containing a series of essays in commemoration of the centenary of the birth of Charles Darwin, and of the jubilee of the publication of the "Origin of Species." Of this publication Professor Seward is the editor, and the writers of the essays include the foremost biologists of the day, and deal with the influence of Darwin's contributions to biological knowledge, and the subsequent progress of scientific inquiry into organic evolution. The Press Syndicate will also publish a reprint of Darwin's first draft of the "Origin of Species," of which a copy will be presented to each delegate. This, together with the second and enlarged draft, will be published as a single volume. With regard to these drafts, it is of interest to quote Darwin's reference to them in his autobiography, written in 1876: "In June, 1842, I first allowed myself the satisfaction of writing a very brief abstract of my theory in pencil in 35 pages; and this was enlarged during the summer of 1844 into one of 230 pages, which I had fairly copied out and still possess."

West Ham Park.—The Lord Mayor and the Sheriffs will, we learn from the "City Press," pay a state visit to West Ham Park on Wednesday, June 23, proceeding thither in their State carriages by way of Cornhill, Leadenhall Street, Whitechapel, Bow, and Stratford. On arrival the Lord Mayor and Sheriffs will be received by the Committee of Managers. The chairman will conduct the civic party to the middle of the terrace, and will there welcome his Lordship, at the same time giving a short account of the park and its acquisition by, and the cost to, the Corporation. The chairman of the West Ham Distress Committee having formally handed over the recently completed work, the Lord Mayor will walk round the garden, inspect the new works, inaugurate the new lake, and plant a tree on the Rabbit Hill commemorative of the visit.

Fruits of Foreign Growth were contributed to British markets in large quantities during May, although the aggregate value was less than in the corresponding month of last year. The imports of apples amounted to 125,459 cwt., of the value of £127,432, these figures representing a decrease in quantity of 68,430 cwt., and in value of £50,161. There was also a material decrease in the imports of bananas, the total having been 616,727 bunches, of the value of £172,240, as compared with 653,564 bunches, of the value of £177,767, in May, 1908. There was a relatively large increase in the imports of apricots and peaches, the total having been 18 cwt., of the value of £59, against 1 cwt., of the value of £8. Cherries also were received in largely increased quantities, the total having been 18,814 cwt., of the value of £36,006, or an increase in quantity of 12,988 cwt., and in value of £20,813. Of gooseberries the imports aggregated 423 cwt., of the value of £828, these figures representing a small decrease both in quantity and value. In the imports of grapes also there was a decrease, the total having been 822 cwt., of the value of £3,912, as compared with 1,168 cwt., of the value of £5,069, in May, 1908. Lemons and oranges were received in largely increased quantities, while in the imports of nuts there were decreases. The imports of pears were relatively large, the aggregate having been 8,751 cwt., of the value of £10,174, these figures representing an increase in quantity of 5,853 cwt., and in value of £6,505. The imports of plums were 4 cwt., of the value of £17. Of strawberries the imports were 4,268 cwt., of the value of £8,438, or an increase in quantity of 636 cwt., and a decrease in value of £212. Unenumerated fruits show a decrease, the aggregate imports having been 6,345 cwt., of the value of £10,045. The value of the fruit imports for the month was £771,340, or a decrease of £6,491.

The Gardeners' Royal Benevolent Institution. The seventieth anniversary festival dinner in aid of the funds of the above institution will be held at the Hotel Metropole on Wednesday next, when Lionel de Rothschild, Esq., will preside. Contributions to be placed on the chairman's list are earnestly solicited, and may be sent to Lionel de Rothschild, Esq., New Court, St. Swithin's Lane, E.C., or to the secretary, Mr. G. J. Ingram, at the offices, 175, Victoria Street, Westminster, S.W.

National Vegetable Society.—Good progress is being made with the organisation of this new society, which has for its object, as defined by the rules, the promotion of the wider cultivation of vegetables as food products, the encouragement of their consumption as food, the promotion of exhibitions of such products, whether competitive or otherwise, and to hold trials under such conditions as may offer, with a view to finding the best varieties to commend for general culture to ascertain commercial values when grown under ordinary conditions. The list of vice-presidents is of considerable length, and includes members of a large number of seed firms, and the Executive Committee is a strong one. Mr. E. G. Quick, Kelmscott, Harrow View, Wealdstone, is the hon. secretary.

Vegetable Imports in May were much smaller than they have been in the corresponding month for several years past, the decreases in the imports of potatoes and onions having been very large. Of potatoes the imports were 386,478 cwt., of the value of £251,048, as compared with 1,262,032 cwt., of the value of £430,139 in the corresponding month of last year. The imports of onions aggregated 616,727 bushels, of the value of £113,026, the figures representing a decrease in quantity of 267,092 bushels, and in value of £8,596. Tomatoes, on the other hand, show an increase in quantity of 9,014 cwt., and in value of £6,984, the aggregate having been 97,915 cwt., of the value of £93,613. The value of unenumerated vegetables was £50,187, or a decrease of £18,757. Notwithstanding this substantial decrease last month, the total for the five months amounts to £259,274, or an increase of £46,304, as compared with the first five months of last year.

Continuity of Violas.—In October, 1907, Messrs. Dobbie and Co. planted in an open field at their Marks Tey seed farms a large collection of violas, with a view to determine their hardiness, continuity of growth, and flower production. At the recent Temple Show, and two of the Royal Horticultural Society's fortnightly meetings, they have exhibited bouquets of flowers cut from the plants that have passed through the two winters uninjured, and, as was the case last year, are flowering profusely. The following varieties are the most noteworthy of those which have come through the trial most satisfactorily, and they should, therefore, have the first consideration in making selections for the flower garden: Duchess of York, Pencaitland, Purity, Snowflake, White Empress, Sylvia, Virgin White, Kingcup, Bullion, Klondyke, Primrose Dame, Sulphurea, Grievi, Redbraes Yellow, William Welsh, Lilacina, [illegible] [illegible] Queen, Royal Scot, White Beauty, Mrs E. Farmer, Agnes Brown, Blue Rock, Mrs C. A. Cade, Cream King, Jubilee, Mrs Chichester, Blue Cloud, and Dr. McFarlane.

GRAND YORKSHIRE FLORAL FÊTE AND GALA.

The fifty-first Yorkshire fête and gala was held in Bootham Park, York, on Wednesday, Thursday, and Friday, June 16, 17, and 18, and though there were a few small showers in the early morning, the opening day may be described as "fine but dull." Fortunately the weather was fairly warm, and, as a consequence, there was a large attendance of fashionable folk inspecting the varied exhibits very shortly after the official opening hour of one o'clock. The show was of good average size and quality, but it fell short of the great Jubilee effort of 1908. Specimen stove and greenhouse plants continue to be an attraction, and the large groups arranged for effect are as interesting as ever, though, with the exception of Mr. Donoghue's group, there was nothing of outstanding merit in this section. Fruit was well shown, the display from Welbeck adding another leaf to the laurels won by Mr. J. Gibson, the Duke of Portland's able gardener. Banks of hardy herbaceous flowers, the specimen pelargoniums, the array of fine rock garden exhibits, and the very fine begonias, [illegible], and calceolarias staged by local [illegible] were other good features, while the [illegible] were better than usual.

There were about a hundred and forty exhibitors, one from as far south as the Isle of Wight, and one from as far north as [illegible].

GROUPS.

The great group class is probably the greatest attraction at York in these days, and on this occasion there were five competitors for the handsome cash awards. The space allowed is 300 sq. ft., and artistic arrangement is the great point aimed at. The premier award of £20 was won by our friend and contributor Mr. J. Donoghue, gardener to J. Pickersgill, Esq., Bardon Hill, Weetwood, Leeds, whose design, at once light and elegant, was one of the best ever seen at York, while in the matter of cultivation every plant told its tale of skilful handling. The crotons, used as both tall and dwarf specimens, each set up so as to show itself completely, were magnificent in development, and unusually grand in colouring. These were the great feature of the group, and were set over a groundwork of Rex begonias, small caladiums, tiny polyantha roses, fittonias, and deep green moss. Around the base of each croton and graceful palm there were a few cattleyas, epidendrums, and odontoglossums. Graceful palms and vitis were associated with white liliums and Hiawatha and Dorothy Perkins roses, and some fine dracænas, to make up a suitable background. Second prize fell to Mr. W. A. Holmes, West End Nurseries, Chesterfield, who depended on crotons and roses for his chief effects. There were five competitors, and the remaining awards were secured, in order of mention, by Mr. W. Curtis, gardener to J. Blacker, Esq., Thorpe Villa, Selby; Messrs. R. Simpson and Son, Selby; and Mr. G. Cottam, Alma Gardens, Cottingham, Hull.

In a similar class, but for an arrangement upon a space of 200 sq. ft., there were four entrants, and here Mr. J. Donoghue was again the premier prizeman, carrying off the £12 award with grand crotons arranged with palms, orchids, liliums, and dracænas, but in scarcely so elegant a manner as his other group; Mr. W. A. Holmes was second with a bright exhibit; Mr. Wm. Vause, Leamington, coming third, and Messrs. R. Simpson and Son fourth.

SPECIMEN PLANTS.

These were once more a fine feature, but they are scarcely so imposing as when in the old days they were grouped to form a great trophy in the big circular tent. Messrs. Jas. Cypher and Sons and Mr. W. Vause had things pretty much in their own hands. For nine stove and greenhouse plants, the Cheltenham firm scored, and they had huge examples of Statice intermedia, Pimelia diosmæfolia, Hedaroma tulipifera, Franciscea eximia, Azalea Modele, and Anthurium Scherzerianum; Mr. W. Vause second with a fine hydrangea Dr. Hogg, Erica Cavendishiana, etc.

For six specimens, orchids excluded, Messrs. J. Cypher and Sons led with a splendid pimelia, franciscea, Clerodendron Thompsonæ, and Erica Cavendishiana; Mr. Vause second. For three specimens in bloom, Messrs. Cypher and Sons scored with a wonderful Pimelia dicsmæfolia smothered in heads of pink bloom; Erica depressa, and E. ventricosa magnifica; Mr. Vause responded with Anthurium Scherzerianum, Clerodendron Thompsonæ, and Erica Exquisite. The best specimen stove plant in flower was a large spathed Anthurium Scherzerianum from Messrs. Cypher and Sons; and the best specimen greenhouse plant was Erica ventricosa magnifica from the same competitor; Mr. Vause was second in each instance.

Mr. W. Vause, Leamington, led the way for six ornamental foliage plants, and scored with graceful palms and big, brilliant crotons; Messrs. R. Simpson and Son, Selby, came second. For three specimen foliage plants Mr. Vause led, showing a fine Latania borbonica and a good Kentia Forsteriana; Messrs. R. Simpson and Son second. The best three crotons came from Messrs. R. Simpson and Son, and Mr. Vause was second, but neither showed these plants really well in this class. Messrs. R. Simpson and Son had the best single specimen crotons.

GRAND YORKSHIRE FLORAL FETE: MESSRS E. WEBB AND SONS' GOLD MEDAL EXHIBIT OF MELONS, VEGETABLES, AND SWEET PEAS.

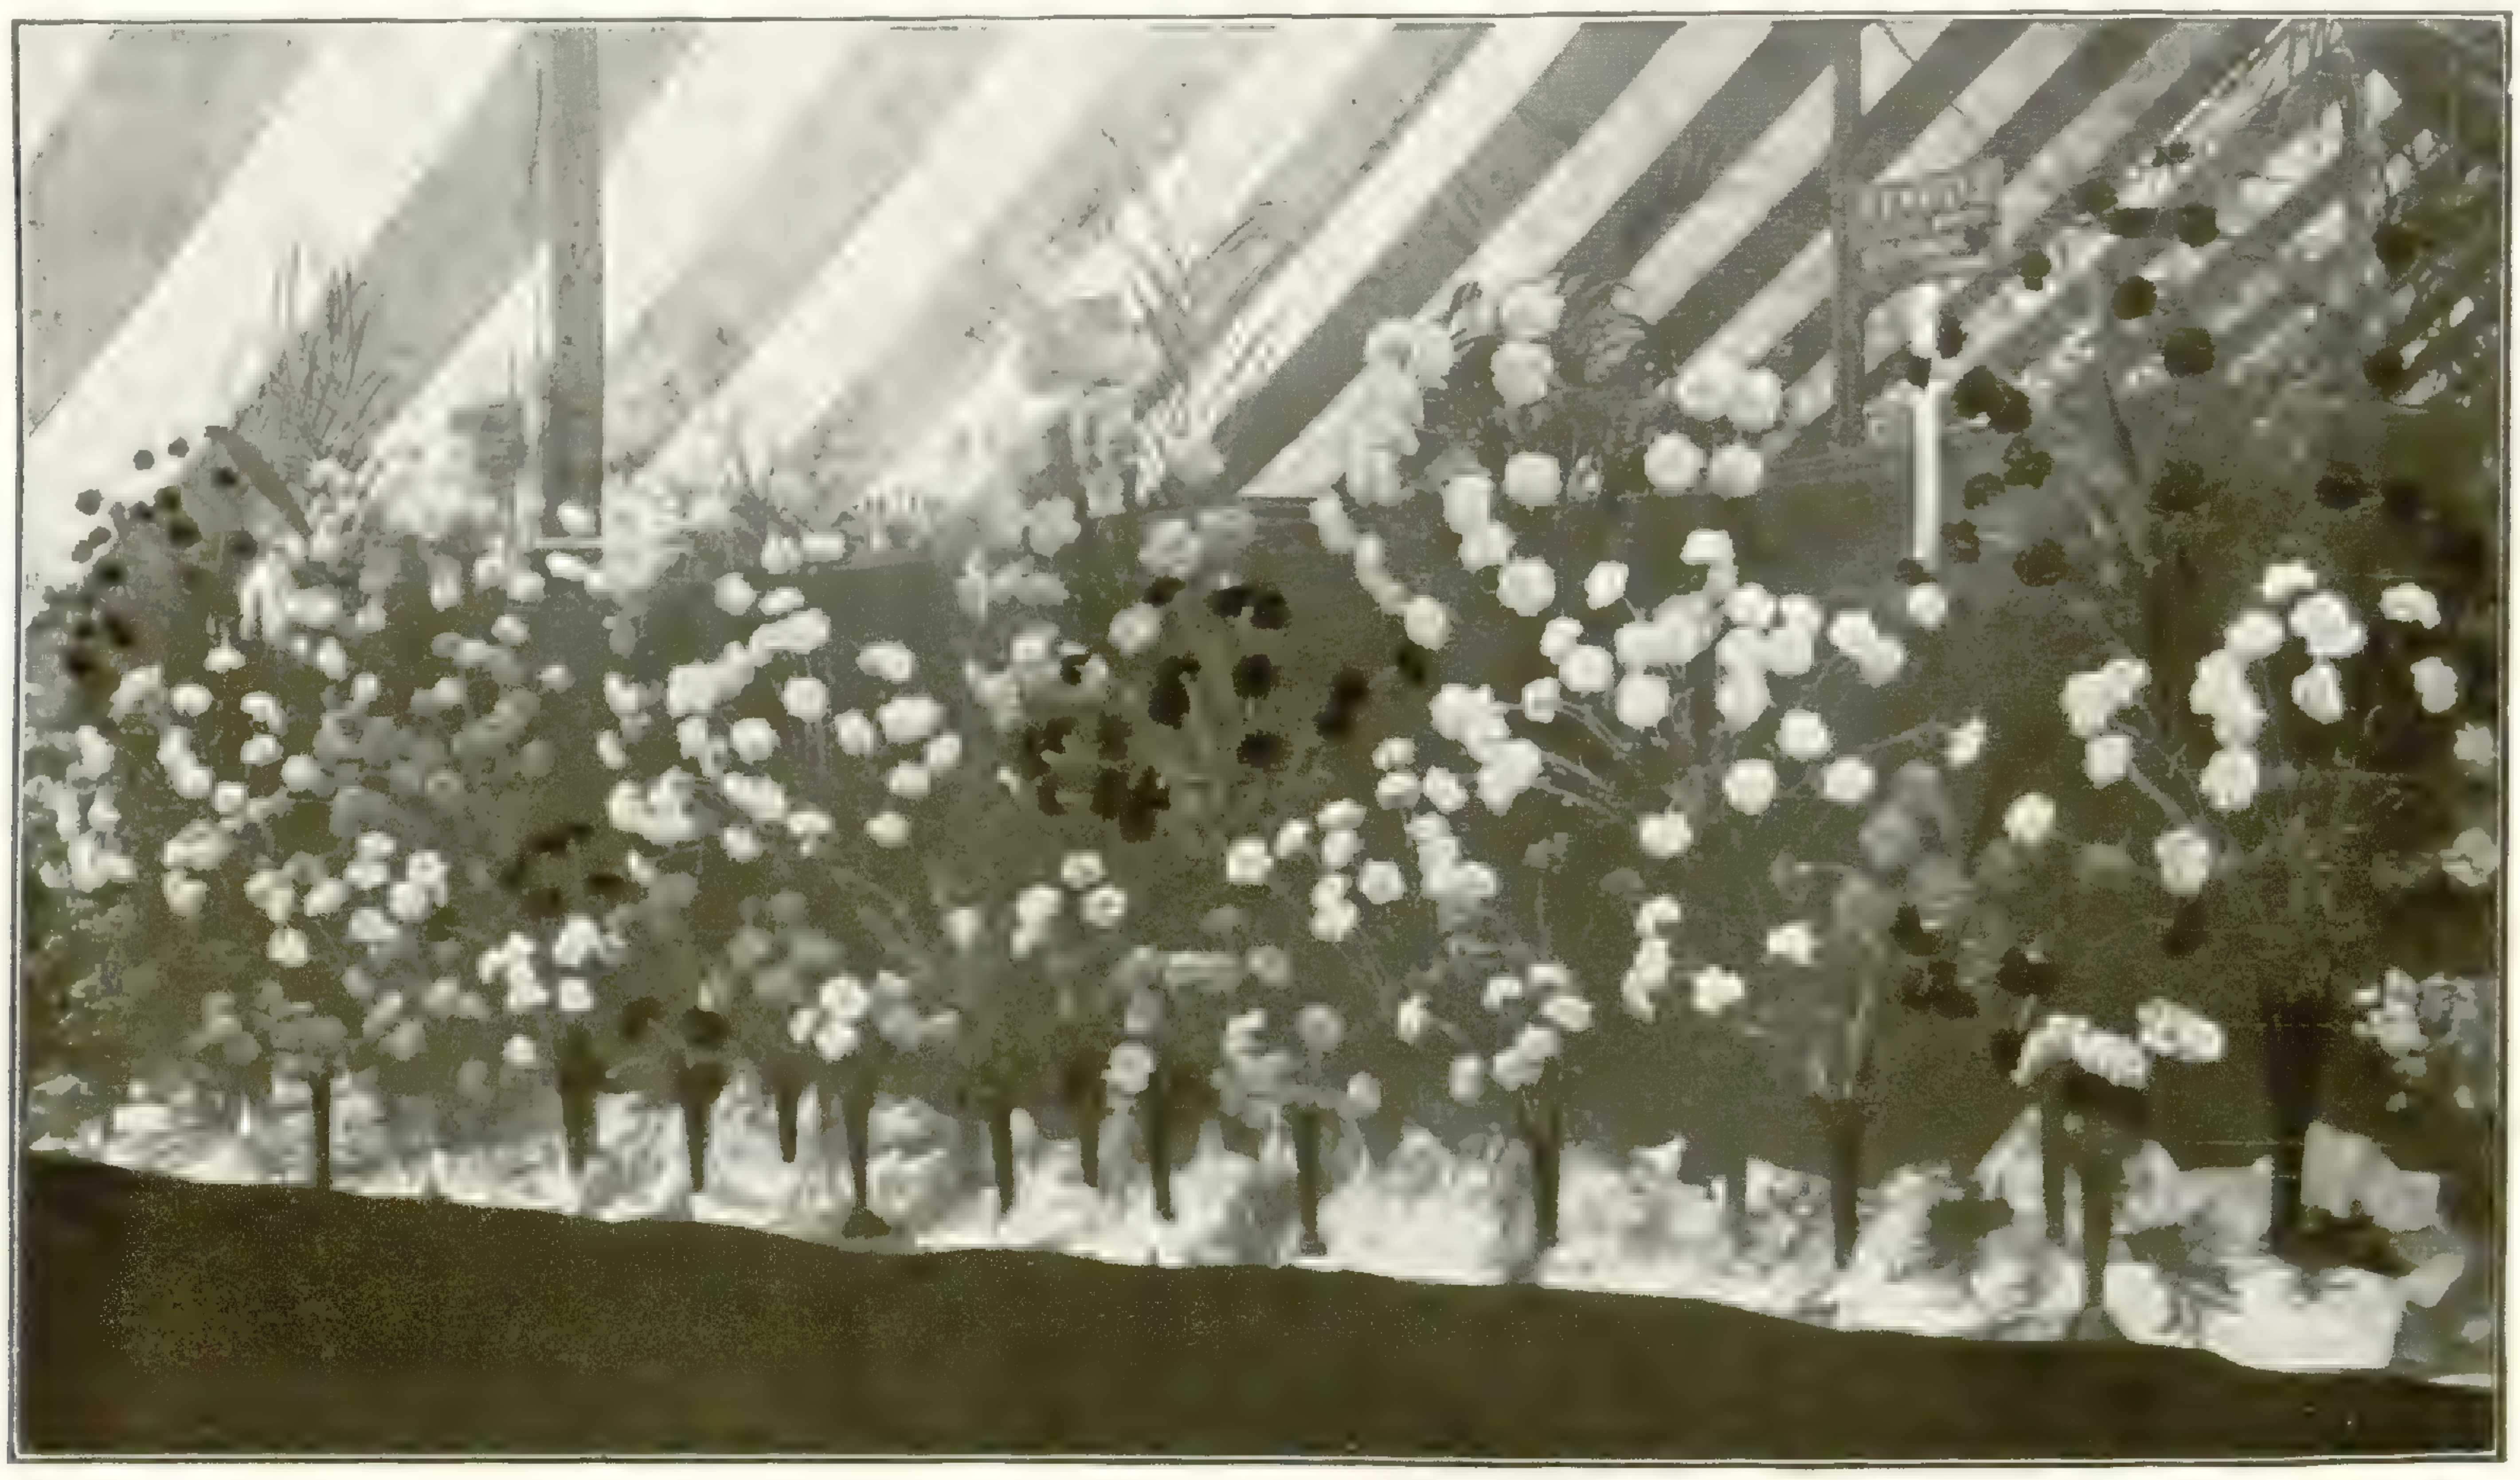
ROSES.

Roses were abundant, and excellent for the time of year. In the leading class for seventy-two blooms in three dozen varieties, the leading award was secured by Mr. George Mount, Canterbury, with lovely flowers, very fresh, bright, and of beautiful form; his leading varieties were Richmond, Ulrich Brunner, Liberty, Frau Karl Druschki, Mildred Grant, Mrs. J. Laing, Countess of Gosford, and Caroline Testout; Mr. George Prince, Longworth, Berks, was a good second with a predominance of light-hued tea-scented varieties; Mr. J. W. Hutchinson, Kirby Moorside, was third; and Mr. E. J. Hicks, Twyford, Berks, fourth.

Mr. G. Mount led for forty-eight blooms in twenty-four varieties, and here he had Richmond, Bessie Brown, Frau Karl Druschki, Kaiserin Augusta Victoria, Mrs. J. Laing, Mdme. Abel Chatenay, and General Jacqueminot in fine condition, Mr. J. D. Hutchinson second. In the class for three dozen blooms Messrs. W. and J. Brown, Peterborough, scored, and they had beautiful blooms of Marechal Niel, Gustave Piganeau, Caroline Testout, C. J. Grahame, Hugh Watson, Lady Rosmore, etc.; Mr. G. Mount second; Mr. E. J. Hicks third; and Mr. M. Dimsdale, Coton, Cambridge, fourth.

The best set of twenty-four roses, distinct, was from Mr. George Mount, Canterbury, whose selection of varieties was pretty much as already noted in other classes; Mrs. E. J. Hicks, second; and Mr. M. Dimsdale third. Mr. E. J. Hicks led for eighteen rose blooms with a very attractive stand, in which Mdme. Jules Gravereaux, Anna Olivier, Betty, Marquise de Sanitz, The Bride, Mdme. Legond Weber, Clara Watson, and Mdme. Constant Soupert were fine; Mr. G. Mount second, and Messrs. W. and J. Brown third. For a dozen white or yellow roses Mr. G. Mount was first with Frau Karl Druschki and Perle Von Godesberg; Mr. E. J. Hicks second.

In the amateurs' classes Mr. H. W. Richards, Westridge, Isle of Wight, led for eighteen blooms, and Mr. W. Hutchinson was second; Mr. Hutchinson was first for a dozen blooms, followed by Mr. R. E. West, Reigate.



[Photo: Hayes.

GRAND YORKSHIRE FLORAL FETE: MR. C. F. WATERS' FINE SILVER MEDAL DISPLAY OF PERPETUAL CARNATIONS.

PELARGONIUMS.

These made a bright feature of the gala, but neither in quality nor quantity did they give evidence of the enthusiasm in their culture that once prevailed in Yorkshire.

Mr. J. R. Wedgwood, Burton Lane, York, had the finest six show pelargoniums, but they were not yet at their best; of Edward Perkins he had a huge specimen; Mr. W. F. Crowther, Wigginton Terrace, York, was a good second with rather smaller examples of Ed. Perkins, Mrs. Pete, Duchess of Teck, etc.; and Mr. H. Pybus, Monckton Moor, third. Mr. Pybus scored for a dozen zonal or nosegay pelargoniums, and he showed flat trained examples, freely flowered, his best being Distinction, Dr. Orton, Lady Reed, Liberty, Mrs. H. Cannell, and Mrs. Kelley; Mr. Jas. Sunley, Ashleigh, South Milford, second.

Mr. H. Pybus led for six zonal varieties, and here he had his best plants, of Henry Jacoby, Mrs. Paul, Lady Reed, Brutus, Mrs. Kelley, and Mrs. Mostyn; Mr. J. Sunley second, and Mr. G. Lee third. Mr. Pybus was again successful in the class for three zonal pelargoniums, and was followed in order by Mr. J. W. Clark, Skelton Street, Clifton, York, and Mr. J. Sunley.

Double zonal varieties, six specimens, were best displayed by Mr. J. W. Clarke, who had finely-flowered flat examples of King of Denmark, Ernest Louth, R. D. Sayers, Mdme. Thibaut, F. V. Raspail, and Royal Star; Mr. W. F. Crowther a good second, and Mr. H. Pybus third. The first prize for three ivy-leaved pelargoniums was won by Mr. J. R. Wedgwood with Fair Maid of Guernsey, Souv. de Chas. Turner, and Baden Powell; Mr. Crowther second, and Mr. H. Pybus third.

GROUPS OF FLORISTS' FLOWERS.

The groups of fuchsias were scarcely so good as in previous years. For an arrangement 12ft. by 6ft., Mr. J. W. Clarke, Skelton Street, Clifton, York, was awarded first prize for a pleasing group of pyramidal plants of popular varieties; Mr. W. Kettlewell, Horner Street, York, second; and Mr. G. Lee, Surtees St., York, third. Premier place for a group of carnations was won by Mr. J. Donoghue, Bardon Hill Gardens, Weetwood, with well-grown Malmaison and perpetual varieties, nicely arranged with ferns and palms. Messrs. Walshaw and Son, Scarborough, were placed second, and they showed popular perpetual varieties entirely; Mr. J. E. Skaife third, with Malmaison and perpetual varieties.

Three competitors entered in the class for a collection of roses in bloom, in pots, arranged on a space 15ft. by 7ft., and here Mr. W. Todd, Vymer Street, York, was an excellent first with large-flowered H.P. and H.T. varieties, arranged against a background of ramblers, and with standards of Dorothy Perkins towards the front; Mr. J. E. Skaife second, and Mr. W. Longstaffe, Sydney Street, York, third.

No fewer than five groups of gloxinias were set up, and, on the whole, these were very creditable efforts. Mr. J. Robson, gardener to Sir J. Grant Lawson, Bart., Middlethorpe Lodge, York, won the first prize; Mr. G. Bush, gardener to J. A. Dunkerly, Esq., St. Mary's Terrace, Beverley, came second; and Mr. Clark, gardener to Captain Walker, Mill Mount House, York, was third. The groups of show pelargoniums were hardly so successful as the groups of gloxinias and begonias, but there were five competitors, and the leading prizewinners, in order of merit, were Mr. G. Lee, Surtees Street, York, and Mr. J. Dobson.

The groups of begonias provided a brilliant display of colour that was greatly appreciated. There were six competitors, and each filled a table 12ft. by 5ft. The judges placed Mr. T. Winn first, and Mrs. Akenhead second for well-arranged exhibits. Calceolarias also yielded a brave colour display, and there were six groups of these gay conservatory flowers; Mr. P. Stancliffe, Solberge, Northallerton, was placed first; Mr. J. W. Coulthurst, Gargrave House, Gargrave, Leeds, second; and Mr. W. Barnes, gardener to W. Talbot Algar, Esq., Brockfield Hall, York, third.

Mr. W. Longstaffe, Sydney Street, York, gained first prize for a group of roses with a fairly good set, his pots of dwarf polyantha varieties being very good; Mr. J. E. Scaife, Clarence Street, York, second; and Mr. H. Pybus, Monckton Moor, Wormald Green, third.

FLORAL DESIGNS.

The prettiest epergne was a charmingly elegant design, composed of pink sweet peas and roses, associated with schizanthus sprays and gypsophila; this was from Mr. A. A. Elliott, Kirkgate, York; Mr. C. Simpson, Spring-gate, York, second; and Mr. Thackeray, Horse Mill Yard, Knaresborough, third. The prettiest basket of roses was of red and pink flowers, beautifully arranged by Messrs. Harkness and Son, Bedale; Messrs. Aldis and Rowntree, Albion Street, Leeds, second; and Mr. C. E. Simpson third. Messrs. Perkins and Sons, Coventry, led for a hand basket of flowers with a splendid basket of Malmaison and perpetual carnations; Mr. C. E. Simpson second with Enchantress carnations; and Messrs. Aldis and Rowntree third with Mikado and Mrs. Burnett carnations.

The best basket of orchids was a sumptuous arrangement of cattleyas and odontoglossums from Messrs. Perkins and Sons, Coventry; Mrs. H. B. Vernon, Eaton Ter. Bowdon, Cheshire, second.

There was a splendid array of bouquets in the florists' section, and five classes were provided for them. Messrs. Perkins and Sons, Coventry, had first prize for a pair of bridal bouquets, composed of odontoglossums and roses. For two ball bouquets Messrs. Aldis and Rowntree led with gorgeous designs in cattleyas, oncidiums, and odontoglossums; and Messrs. Perkins and Sons were second.

The Coventry firm led for two hand quets, and these were very rich and brig designs in cattleyas, oncidiums, and odont

(Continued on page 488.)

HANGING BASKETS.

Suitable plants cultivated in baskets play an important part in the decorative scheme of the garden, and as seen suspended from verandahs, balconies, arches etc., present a very effective and artistic appearance. But it not infrequently happens that the baskets do not receive regular attention in the matter of watering, and one often sees plants exhibiting signs of distress due to drought. It must be remembered that they are subject to rapid evaporation, and during hot weather call for copious supplies of water.

This leads me to say that fairly large and deep baskets should be selected for open garden use, the most suitable being those of eighteen inches diameter and about fifteen inches deep. It is a great mistake to use light sandy soil, and greasy, tenacious loam, together with leaf-soil or short manure, should be employed, as this is calculated to hold the moisture for a reasonable time in the hottest weather.

It may be a little late to give advice to many amateurs, but those who possess a greenhouse should fill such baskets as are required for out of door work, and suspend them over the walk or path of the greenhouse. Treated thus the plants become thoroughly established early in May, and make very considerable growth before they are placed in their permanent quarters.

With respect to the kinds of plants that are suitable for baskets, there is, speaking generally, a slavish adherence to old-fashioned arrangements, and the same applies to window boxes. Hence, I would advise a departure from the eternal marguerites and crimson geraniums, and enter a plea for originality in the matter. Phlox Drummondi grandiflora, without the aid of other plants, forms a delightful picture when a number of growths are trained upright to the chains, and the remainder are allowed to take pendulous form. The same applies to petunias, which revel in sun-bathed situations, and bloom most profusely in hot seasons and in soil that contains only a very small quantity of manure. Fuchsia Meteor will form a dense bronzy-golden mass, and hide all traces of the basket if dibbled in here and there between the wires after the basket is filled with soil. I noted a pair of baskets last season, in which this and Heliotrope President Garfield were the sole occupants, and the effect produced was altogether charming.

The more refined varieties of tropæolum, both single and double, cannot be surpassed for prodigality of bloom, and, further, are drought-resisting. White pelargoniums with trailing masses of the blue Campanula isophylla cannot fail to please, while its white counterpart may be associated with that splendid acquisition amongst pelargoniums, Paul Crampel. Three or more plants of Zea gracillima variegata inserted between the last-named will enhance their beauty, and lend a light and graceful appearance to the whole. Very fine is Celosia plumosa, with the golden-leaved creeping Jenny (Lysimachia nummularia aurea), and a plant or two of Lobelia gracilis. Gazania splendens variegata forms a brilliant trailer.

I saw Viola Niphetos smothering the exterior of a basket last season, and certainly it must rank as a first-rate subject for partially shaded positions. Light-coloured fuchsias, such as Mrs. Marshall, Ballet Girl, etc., are wonderfully effective in baskets, and here the changes may be rung with Veronica Andersoni variegata as a trailer. Ivy-leaved pelargoniums are a host in themselves, and, to my mind, are seen at their best when white varieties are allowed to take pendulous form, and dark kinds trained into a mass above. The white varieties may be used with fine effect in company with the fibrous Begonia Bouquet de Feu, while Panicum variegatum may rub shoulders with double begonias.

The verbenas clamour for mention and attention, and should be pressed into service to harmonise or contrast pleasingly with other occupants. One of the most beautiful examples I have ever seen in the way of basket furnishing was composed of Antirrhinum Queen of the North, of spotless purity, in a framework of scarlet Defiance verbena, and this leads me to suggest the crimson-flowered Antirrhinum Crescia and Kœniga maritima (tall variety) as a fine combination. Other combinations will occur to the cultivator, and I should like to point out that the work of watering may be facilitated, and reduced to a minimum by attaching the baskets to a pulley arrangement, when they can be readily lowered and immersed in a bath of water from time to time during hot weather.

Walter H. Aggett.

IRIS EDWARD MICHEL.

A beautiful variety with large purple flowers, shown by Messrs. R. Wallace and Co. at R.H.S. Meeting, June 8, when an Award of Merit was conferred upon it. (See New Plants.)

THE LEMON-SCENTED BUCKLER FERN.

It is a very curious thing to note the practically complete absence of the beautiful Lastrea montana (oreopteris) fern in all general collections. Even among the splendid array of varieties of British ferns in Kew Gardens, it is so conspicuous by its absence that the writer has sought for it in vain, so that, if it be there, it is, at any rate, not represented as it ought to be, considering the number of fine varietal forms which exist. In some of the collections in private hands, and especially in that of Mr. George Whitwell at Kendal, it figures prominently in many forms, and is not eclipsed in beauty by any of its rival native species.

Normally it resembles in general habit the common Male fern, growing nearly as high, and forming, as that does, shuttlecock-like circlets of fronds, springing from a central crown. The fronds, however, differ by being feathered to the base, that is, the side divisions begin there as short, rounded lobes, expanding higher up, and tapering at the tip in such a fashion as to form a lance-shaped outline, the sub-divisions being again divided into serrate lobes.

L. montana is, however, distinguished clearly by other characters. Its colour, for instance, is a light yellowish green, and when a frond is gently drawn through the hand, a very marked lemonlike odour is perceptible, due to the rupture of minute glands on the surface. The spore heaps are also much smaller than in the Male fern. As its name indicates, it is mostly found in great numbers on mountain sides, fringing the glens and ravines with crowded masses of fronds, but it is by no means confined to high levels, as we have ourselves found it in Epping Forest, in the Weald of Kent, and in the Sussex forests, where it abounds in curious association with luxuriant bracken, beneath whose fronds it flourishes in a quite exceptional way, the bracken usually being a terrible monopolist, so that its presence in full vigour is usually a sign for the fern hunter to seek elsewhere.

Curiously enough, in the early days of fern variety hunting, L. montana had the reputation of being exceedingly constant to the normal type, and little liable to afford "sports"; but one of the pioneers, Mr. W. Barnes, of Milnthorpe, in the Lake district, found fine crested and plumose varieties in his locality, and a form, unique at the time, called Barnesi, which bore very narrow fronds, with the short side divisions set horizontally like steps, so marked a form indeed that Mr. Barnes, when he came across a fine clump of it, had to sit down and get his breath again, so great was his surprise and delight at finding what he at first thought must be a new British species. Encouraged by this, other hunters took up the quest, with the result that in the "Ferns of the Lake District," some scores of distinct varieties are registered as local finds, while some fine grandiceps or heavily tasselled varieties were raised by Mr. Barnes from spores.

The old reputation for constancy to the normal is quite exploded, and, in our own experience, it presents fully as many opportunies for the fern hunter as any other native species, since we have found one of the finest tasselled forms on Dartmoor, a thoroughbred plumosum near Kendal, and a good congested form at Aberfeldy, while that curious sport known as truncata has cropped up over and over again in various hunting grounds. In this the side divisions, and the frond tip end squarely and abruptly with the shortened midrib projecting like a thorn.

The general rarity of L. montana in collections would seem to imply difficulty of culture, but in our own experience there is no such handicap. Numerous varieties grow freely and healthily in our suburban garden in good loamy soil, and as a pot plant it behaves admirably, sending up its pretty-scented fronds year after year. Only one thing has to be observed, lime is poison to it, and hence rain water should be used if the house supply is hard water. Drought must also be avoided, as indeed is the case with ferns generally. For soil it prefers good mellow loam, lightened a little with leaf-mould and coarse sand, but this refers more to pot culture than culture in the open, where it thrives with us in the garden soil of the locality, and as its habitats on the open hill sides indicate, it can be planted in somewhat sunnier positions than are favourable to most of the other species. It may, however, be noted here that most of our British ferns can stand a good deal of exposure to sunny conditions if there be no risk of drought at the roots, the two together inevitably meaning burnt fronds and enfeebled plants. L. montana is quite deciduous, its fronds dying down entirely in the autumn. Care must, however, be taken that, if in a pot, the plants are not allowed to dry out entirely in the winter, a remark which applies with equal force to all deciduous ferns.

Chas. T. Druery, V.M.H., F.L.S.

NEW PLANTS, ETC.

LÆLIO-CATTLEYA MIKADO.

This very pretty and attractive hybrid is a fine addition. There are an abundance of mauve, purple, and white orchids of the lælia and cattleya group, hence this early summer flowering hybrid with gay yellow sepals and petals and a bright crimson-purple, yellow-edged lip, becomes most acceptable. The flowers are of good size and the plant flowers very freely. F.C.C., R.H.S., June 8. Lieut.-Colonel Holford (orchid grower, Mr. H. Alexander), Westonbirt, Tetbury.

CATTLEYA MOSSIÆ VAR. A. DIMMOCK.

This is certainly one of the very finest of the many varieties of the beautiful Cattleya Mossiæ. It has flowers of the largest size, finest substance, and splendid form. The sepals and petals are soft rosy lilac, and the big lip has a yellow throat, a bright purple centre, and a white, frilled margin. A.M., R.H.S., June 8. Lieut.-Colonel Holford, Westonbirt.

LÆLIO-CATTLEYA FERONIA.

The feature of this hybrid between Cattleya Enid and L.-c. Haroldeana is the large size of the rounded lip. The latter organ is rather too large for the size of the sepals and petals. It is rich purple with buff suffusion, and the sepals and petals shaded with rosy-pink over yellow. A.M., R.H.S., June 8. Sir Trevor Lawrence, Bart., Burford Lodge, Dorking (orchid grower, Mr. W. White).

ODONTOGLOSSUM AMABILE FOWLER'S VAR.

A finely formed and large flowered variety of this handsome hybrid, several of the blooms being over four inches deep. The flowers are rather closely set on the spike. Sepals and petals heavily marked with dull brown, margined with white and tipped with rose. Lip soft purple with a white apex. A.M., R.H.S., June 8. J. Gurney Fowler, Esq., The Glebelands, South Woodford (gardener, Mr. J. Davis).

POLYPODIUM GLAUCUM CRISTATUM.

A very handsome light glaucous green fern with bold yet graceful fronds that have the divisions waved, and incised along the margins. It bears a considerable resemblance to P. Mayi. A.M., R.H.S., June 8. Messrs. T. Rochford and Sons, Broxbourne.

ARAUCARIA EXCELSA SILVER STAR.

An interesting and attractive variety of an old favourite plant, and differing from the type in having the tips of every growth creamy green instead of deep green. A.M., R.H.S., June 8. Messrs. T. Rochford and Sons, Broxbourne.

DOBBIE'S LONG-SPURRED AQUILEGIAS.

This is a particularly fine strain of long-spurred columbines, remarkably free, large-flowered, and presenting a wonderful range of colouring, as well as unique colour combinations. A.M., R.H.S., June 8. Messrs. Dobbie and Co., Rothesay and Marks Tey.

GEUM COCCINEUM VAR. MRS. J. BRADSHAW.

In this variety the flowers are often three inches across, and they appear to be freely borne by the plant. They are rich glowing scarlet, and contain several rows of petals, though not fully double. A very fine variety. A.M., R.H.S., June 8. Messrs. G. and A. Clark, Dover.

IRIS EDWARD MICHEL.

A beautiful iris belonging to the pallida group. It has large flowers in which the falls are deep rich purple, with a golden crest and a rosy mauve base. The standards are broad and substantial, and of a lively bright purple shade. Very attractive. A.M., R.H.S., June 8. Messrs. R. Wallace and Co., Colchester.

LITHOSPERMUM PROSTRATUM HEAVENLY BLUE.

A delightful little plant bearing a profusion of bright sky-blue flowers. A charming plant for the rock garden. A.M., R.H.S., June 8. Mr. Amos Perry, Hardy Plant Farm, Enfield.

SCHIZANTHUS BEAUTY OF TRENT.

In this strain the flowers are larger than usual, and show a considerable range of colouring. Whether the larger flowers constitute additional beauty is a moot point, indeed a matter of individual taste. This strain is a handsome and useful one, and will serve to further popularise schizanthuses. A.M., R.H.S., June 8. Mr. H. Parr, The Gardens, Trent Park, Barnet.

SWEET PEA PARADISE APPLE BLOSSOM.

A very effective variety with white flowers very heavily shaded with bright deep rose at the margin. The name is unfortunate because the flowers do not suggest apple blossom, at least not terrestrial apple blossom. A.M., R.H.S., June 8. Miss Hemus, Holfast Hall, Upton-on-Severn.

SCOLOPENDRIUMS.

S. vulgare crispum multifidum. — A good type of the hartstongue fern, with the wavy fronds of the crispum group, and the added beauty of terminal tassels. A stout and sturdy grower. A.M., R.H.S., June 8. Messrs. H. B. May and Sons, Edmonton.

S. vulgare crispum fimbriatum.—In this variety the waviness is very pretty, and along the margins of the fronds, where the waving or frilling rises, there are little crests, so that the whole appearance of the fern is distinct and elegant. A.M., R.H.S., June 8. Messrs. H. B. May and Sons, Edmonten.

RHODODENDRON LUSCOMBEI.

Some connoisseurs of garden rhododendrons object to this variety on account of its early flowering propensities, and because it does not possess the shapely conical trusses of flowers for which the catawbiense varieties and hybrids are famous. It is, however, a most beautiful variety, and is worthy of inclusion in the most exclusive collections, especially in the south and south-west counties. It is a hybrid between two useful species, R. Fortunei and R. Thomsoni. Both are noted as being free flowering, the former having very large, fragrant, pinkish flowers, which have more than the normal number of petals, and the latter having long tubular, blood-red flowers of a peculiarly thick texture. The offspring is intermediate between the parents.

The habit of the R. Luscombei is that of the free-growing R. Fortunei, while the flowers are as far across as those of that species with the longer corolla tube of the other parent. The colour is a beautiful [illegible] rose. A few flowers only are borne in each truss, but the variety is remarkably floriferous, and individual flowers are 2 to 3in. across the mouth. Mature specimens form bushes at least 6ft. or 7ft. in height and 10ft. across. The normal flowering time in the neighbourhood London is from the middle to the end April; this, however, may be advanced or delayed a week or two according to the particular district in which a plant is growing.

W. Dallimore.

NOTES ON SOME GARDEN PESTS.

One of the numerous qualifications of the ideal gardener is a good practical knowledge of entomology, for it is only by knowing the life history of the various garden pests, which the average man includes under the term "insects," that we can intelligently wage war against them. But it may be truly said of gardening, "Ars longa, vita brevis" (Art is long, but life is short), and doubtless Mr. Rider Haggard is uttering a truth of general application when he says at the beginning of his "Gardener's Year" that he has never met the individual, employer or servant, who was master of all branches of gardening. Still, some knowledge of the manner of life of the denizens of our gardens is necessary to everyone who aims at success in any department of horticulture, as the capacity to get the upper hand of them is often such a large factor in determining the final result, especially in the growing of fruit. In the space of one article, it is quite impossible to give the barest outline of the life history of even the most common enemies of our gardens, but I propose to give some few hints gathered in the course of a fairly long experience in an old garden, in which, by reason of old walls, old trees, and old everything, such pests are more than ordinarily difficult to dislodge. Let the large fruit-grower and the professional gardener pass these notes by, as they are only composed of the experiences of one amateur, written for, it is hoped, the benefit of others like himself.

If it were asked which pest is the most common in gardens, probably most would say,

The Aphis.

The aphis family includes nearly 200 species, but though aphides are universal, or nearly so, some of the most common species are by no means difficult to overcome. The mistake which is most generally made is to leave the visitation alone until it has assumed large proportions, or the aphides have become partially concealed in the curled-up and distorted leaves and shoots. There are various effective solutions which can be used, still perhaps none more effective than the solution of soft soap and quassia chips, though a paraffin-naphthalene emulsion of soft soap is preferred by some. The great point is to assume that the aphis will come on our peaches, roses, bush fruits, etc., and to spray them early. If a peach tree is carefully inspected, even when in blossom, that is, before any leaves are formed, individual aphides may generally be found, and occasion should be taken as soon as the blossom is set to thoroughly cleanse the tree, as nothing is more true in dealing with this pest than the saying that "a stitch in time saves nine."

There are some species of aphis, however, which are not so easily got rid of, and one of these is the woolly aphis or American blight, which, when once well established in an orchard has indeed come to stay. The moral is obvious—keep a keen look-out for it and deal directly with every little piece of woolliness which appears, for at this stage the remedy is simple, supposing the parts attacked to be easily accessible. The first lodgment is generally where a piece has been cut off, or a wound of some sort made, and the best thing to do is, apply methylated spirit or a strong emulsion of paraffin and soft soap with a stiff brush, well working it into any little fissures in the bark.

Gooseberry Sawfly.

The larvæ of the gooseberry sawfly, the bluish-green and black-spotted grubs that strip our gooseberry bushes of all, or most of their leaves, and sometimes spread to the red and white currant bushes, few of us escape. Large growers spray with poisonous solutions, which are all more or less objectionable in the confined space of gardens, especially as it has to be repeated at intervals of ten or twelve days for six or eight weeks. There is nothing quicker or more effective in moderate-sized gardens than hand-picking, the labour of which may be very much reduced if from the time the oldest leaves are fully developed the trees are carefully looked over every week, and the infected leaves picked off before the broods spread. The eggs are laid on the under sides of the leaves, and as soon as they are hatched, the minute grubs perforate the leaves, and if we pick these leaves we remove broods of a score or more at a time. If the first brood is allowed to escape and grow up and become sawflies, caterpillars will in a few weeks appear in myriads. The caterpillars forming the last brood bury themselves in the ground and remain there through the winter, and if the surface soil under the bushes is drawn away and buried any time between the autumn and the spring the pest may be made an end of, unless we have "laissez-faire" neighbours. Other more or less effectual remedies are syringing with a paraffin-naphthalene emulsion of soft soap, or a solution of Calvert's carbolic soft soap, dusting with hellebore powder, which is poisonous, or a mixture of lime and soot when the leaves are damp, all of which remedies necessitate a washing of the green fruit before using.

Magpie Moth.

Larvæ of the magpie moth are sometimes mistaken for the caterpillars of the gooseberry sawfly, but they are quite different, being larger and of a white colour, with black spots along the back, while the method of progression is by looping. The "black, white, and tan" speckled moth, with its slow flight is a familiar object in most gardens on summer evenings. Its life history is very different from that of the last-named, the caterpillars being hatched late in summer as little black threads, and making but little growth till the spring, passing the winter in any shelter they can find—dead leaves, cobwebs, etc. They do not come in such numbers as the larvæ of the sawfly, but as they are on the spot as soon as the buds open in the spring, they often do little less damage. Apart from the hand-picking of the caterpillars and the destruction of the moths, the winter washing recommended for all fruit trees is perhaps the most effective; and, if this is combined with the clearing up of all rubbish which can possibly form a shelter, these caterpillars will give no trouble.

The Winter Moth.

This has been a terrible scourge to fruit growers, but the grease-banding which is now so universally practised by large growers has much reduced its prevalence, at least in the districts with which I am acquainted. The males are on the wing in November and December—a season when we do not think much about such things—and where any trace of the moth is found the trees should be grease-banded, either at once or the following autumn, to anticipate its depredations. The simplest form of grease-band is made of a strip of grease-proof paper tied round the trunk and smeared over with cart grease. The females, being unable to fly, have to crawl up the stems, and are caught by the grease, to which they stick. As a female is stated to be capable of laying 200 eggs, she is worth catching even in small numbers.

Lackey Moth.

This has a long, soft, downy caterpillar, with a blue-gray head and red, blue, and yellow stripes down the back. When young the larvæ are gregarious and live in a web, at least in bad weather and at nights, and devour everything within reach during the day. The eggs are laid by the moth during the latter part of the summer, but the larvæ do not hatch out till the spring, and a keen eye may see, any time when the leaves are off the trees, the clusters of eggs glued round the twigs and small branches of apples and pears. As both eggs and larvæ are conspicuous, the safe and sure method of hand-picking is the best remedy.

Codlin Moth.

The caterpillars of this moth live on the pips of the apple and cause it to fall, the loss on this account being estimated sometimes to amount to one-quarter of the crop, and I have known little bush trees completely cleared by it. The only really effectual way of fighting this pest is by spraying with a poisonous insecticide, notably Paris green, as soon as the blossom has set and two or three times afterwards at intervals of a fortnight. This is not practicable in ordinary gardens, where the fruit trees and vegetables are often near each other, but in such cases we can do much to mitigate this pest by a few precautions. All dropped fruits should be picked up as soon as possible, even when very small, and destroyed or used, before the maggot, as it is generally called, has time to crawl away and find a hiding-place in which to undergo its transformation into the chrysalis state, from which it will emerge late in the summer or in the following spring. From June onwards bands of sacking should be kept tied round the trunks of the trees a foot or two above the ground, as the grubs will hide themselves in this on the way up the stems to find a shelter. The bands should be examined occasionally, and any grubs or chrysalides destroyed, immense numbers being sometimes caught in this way. The trunks of the trees should be kept free from moss and loose bark, and no rubbish should be kept lying about in which the grubs can hide themselves. Alger Petts.

Rhododendron Ascot Brilliant.—The varietal name of this rhododendron is a most appropriate one, as it is the most brilliantly coloured of all the rhododendrons that I am acquainted with. It was, I believe, raised by the late Mr. Standish at Ascot, the parents being the Himalayan R. Thomsoni and a garden variety. In general appearance it shows a marked proportion of the influence of R. Thomsoni, particularly in its scarlet flowers, their shape, and loosely disposed cluster. It is also a little later in blooming than R. Thomsoni, and thus stands a better chance of escaping late spring frosts, which are liable to mar the beauty of several Himalayan species. Apart from this variety, R. Thomsoni has played a part in the production of several hybrids, among the best known being R. Shilsoni, between this species and R. barbatum; R. Luscombei, whose parents were R. Thomsoni and the Chinese R. Fortunei; and some of the newer forms raised in Cornish gardens. With regard to R. Thomsoni itself it is, unless very favourably situated, rather apt to get bare and gaunt-looking, that is to say, in the neighbourhood of London; but these faults are not met with in the extreme West of England or in the sister isle. The large cup-shaped calyx forms a notable feature of the flower of R. Thomsoni.—W. T.

ROSES IN POTS.

At the end of June so many good rose blooms can be had from the open garden that roses under glass are not in much request. Even our latest pot plants are over by this time, and only a stray bud or two can compare with those from open-air specimens. It is well to remember that the present time has to be treated as equivalent to late autumn, as regards our roses under glass. They have had their full flowering period, and now need rest and some aid toward efficient ripening. The first point to future success lies in giving all air possible, and where the roses are planted permanently out into borders this is very necessary.

Roses in pots can be taken outside, and will generally do better there than when kept under cover. Climbers and others of strong growth, out of pots, need to have the weaker shoots removed, as well as those rods that have flowered this season. In fact, this latter part should have been attended to long ere this, and I only repeat the hint as a reminder. It is particularly necessary to have well-developed and ripened rods upon Marechal Niel, William Allen Richardson, and others of the same habit. One does not want a lot of twiggy growth, or a number of half-developed rods, but a few that are vigorous, and they can now be helped with liquid manure. Give free ventilation to these as it helps them in every way. Although I would keep roses under glass rather dry, to assist maturation of the wood, it will not be wise to curtail the supply of water to the climbers before growth is more developed. Consider carefully as to whether the soil around these planted-out roses is really dry or not, and do not be satisfied with a mere surface examination.

When removing pot plants to the open select a position that is fairly sunny, but partially shaded from midday heat. If the pots are not half plunged see that the outer plants have some protection against sudden drying from sun and wind, which too often cripples their roots. Most of the hybrid perpetuals should be ripening now, but many of the tea-scented and hybrid tea varieties will persist in continuous growth. This can be somewhat checked by keeping the plants rather dry, without allowing them to become distressed. Failing this, we have a superfluity of growth that weakens the plant, and does not afford such well-matured wood to prune back to for early winter forcing, and the plants need a short rest previous to this. Frequent syringing overhead will help support the wood during its ripening. During the natural course of autumn ripening we have heavy dews, and dull, often wet days, and it seems to me more natural to help our plants in summer by a freer use of the overhead spray than is usual, and more in keeping with late autumnal weather.

Of course, no hard and fast rule can be laid down for all plants, and where some are in full and rampant growth we need help with liquid manure still; but experience proves, the better we get our plants ripened by early September the more successfully they can be forced, and to do this a beginning should be made soon.

I do not propose dealing with insect pests and diseases, they are always more or less with us, and the treatise upon rose enemies by the National Rose Society supplies every information, but I would remind readers of the great harm worms do to plants in pots. We do not need their help in drainage, and it is well to put an eggcup full of soot where the drainage hole of the pot rests. Pieces of slate or tile often fit so close that soil washed out of the pot causes stoppage, worse than the worms would.

The present is a good time to repot roses, and if done well now they will be nicely established for early forcing, and need no further shift before rehousing. I am dealing now with those that are in small pots or have quite exhausted the soil. There is no special compost needed, a good mixture supplies all that is necessary. Consider how vastly different the soils are that roses grow in; quite as much so as with any of our popular flowers. What they do seem to thoroughly appreciate is fresh soil of a rather stiff nature, and I find they have a great objection to the dark-coloured, humus-charged soil from an old vegetable garden.

A. PIPER.

SOME DWARF IRISES FOR THE GARDEN.

Irises are among the most beautiful of all flowers, and many of them possess such wonderful combinations of colour, and such remarkable form, that they have been justly called the "poor man's orchids." They are suited for practically all positions, as among them we may find plants which will flourish with their feet in the water; others which like the moisture, but which prefer their roots above it; and others, again, suited for the driest and sunniest positions in the gardens of the many.

Then there are irises short and irises tall; flowers for the big garden and for the amateur's little plot or rockery. In the present notes I wish to say a few words about a charming section, growing not more than a foot high, and giving exquisite little flowers, small, compared to those of some of the species, but really large when compared with the little plants which bear them. They all belong to the flag irises, i.e., those which have rhizomatous root stocks—this being the easiest section of all to grow.

Cultivation.

To begin with their cultivation, they are best planted about August, although I have put them in the ground later than that: in fact, I have planted them up to October, although I should not advise this, and would prefer, instead, to put them in about April rather than in late autumn. They do not require a rich soil, and a rather gritty and hard one will induce them to flower more freely. They should have full sun, and their appreciation of what would appear uncongenial conditions may be shown by the fact that they will thrive admirably on a roof or the top of a wall, with only two or three inches of soil.

In planting, the thick rhizomes, or root stocks, should not be covered, and to keep the plants firm it is frequently necessary to put stones about them to steady them until the roots themselves get hold of the ground, and to prevent the plants from being blown over. A little old cow dung may be mixed with the soil if it is extremely poor, but this is not necessary. It must be noted as a truism which should never be forgotten, that these irises are sun lovers, and will never yield the best results when in the shade, where many people will persist in planting them.

The Dwarf Irises to Grow.

Among a very interesting set of hybrids called Balceng, which have been produced by crossing Iris balkana with I. Cengialti, we have a couple which are within the limit of stature I have confined myself to —a foot—and these are beautiful and satisfactory things. They are Miss C. M. Owen and Miss H. M. White. The first is white, flaked with blue, and the other is sulphur yellow, flaked with purple. Then I. biflora gives us two good varieties, purpurea, which is rich purple, and maculata, which has a ground colour of blue and lilac-purple, and having the standards prettily pencilled with lilac. In the varieties of I. Chamæiris, often sold as I. pumila, but taller than the true pumila, we have the type, with deep violet flowers; alba, white and sulphur, white; lutea grandiflora, with yellow standards and deeper coloured falls, and Naomi, of a pretty sulphur yellow. The first and last are about nine, and the others twelve inches high.

I. Cyanea is purple and violet, and the pretty little I. Fieberi, only six inches high, has fine violet-blue blossoms. I. gracilis is both curiously and prettily coloured, the blooms being a combination of silvery-grey, flushed with light purple and sulphur. It is only some nine inches high. Then I. nudicaulis gives us two forms, the type, with violet standards and deep purple falls, and purpurea, with good purple blooms.

Among the varieties of I. olbiensis we have grandiflora, with violet purple flowers; Socrates, handsome, as becomes a flower of its name, and of a kind of claret-purple colour; and sulphurea grandiflora, of a pleasing sulphur-yellow. Then I. paracina is an interesting thing, a hybrid between I. paradoxa and I. sambucina, and having deep bronze-claret flowers, quite curious in their hues.

From Iris pumila we have several charming flowers, among which I have only space to mention cærulea, an exquisite sky-blue iris, only some four or five inches high; the azure Count Andrassy, six inches; and the primrose and brown luteo-maculata, of much interest, and only six inches high.

No space remains to tell in full of the many others recently raised from various sources, but Blanche, white and yellow; Canary Bird, yellow; Ivorina, ivory, orange, and gold; the white and violet Margaret; and the handsome purple Peter Barr, must not be omitted from these notes, so beautiful are they.

These flowers are all inexpensive, and a dozen may be bought for five or six shillings. These will give long delight to the owner when they come into bloom in the later spring months, such as April and May.

S. ARNOTT.

A Prospective Yellow Cineraria.—As the garden varieties of cineraria are by our botanical friends included in the genus Senecio, it seems but a natural trend of events for a yellow, or, rather, a yellowish variety to make its appearance. Such a one is Cineraria flavescens, which, exhibited by Messrs. Veitch, was given an award of merit at the meeting of the Royal Horticultural Society on May 4. It was said to have been raised from Cineraria Feltham Beauty crossed with Senecio auriculatissimus. This last, which Messrs. Veitch have frequently exhibited, was introduced from British Central Africa about a dozen years ago. It is a very pretty plant, but never "caught on" to popular favour. In habit this senecio is of partially climbing or rambling nature, and the golden-yellow flower heads, borne in large terminal corymbs, are about an inch across. The variety flavescens above alluded to is, when first expanded, of a clear pale yellow, gradually passing to white, or nearly so. When one considers the great variety to be found among the garden cinerarias of to-day, and the fact that they have all been evolved from small beginnings, the possibility of a thoroughly good yellow-flowered form is by no means remote. If so, it will be another horticultural gain from the opening up of Central Africa. At present, Coleus thyrsoideus stands out as one of the most valuable plants from that region.—W. T.

POWERSCOURT: THE MANSION, TERRACES, AND FLOWER GARDEN.

SOME GARDENS ROUND DUBLIN—I.

The Sister Isle is famous for its many fine gardens, and it is scarcely possible to conceive a holiday more enjoyable or more full of interest than one spent in wandering from garden to garden in it, inspecting the treasures of each, and gathering something of the enthusiasm of those in charge. Irish gardens possess a great fascination for gardeners in Great Britain, and it is of considerable interest to observe that not a few English and Scottish gardeners have charge of notable establishments, while Irish gardeners would appear to favour English situations. The climate of Ireland is, on the whole, a very favourable one for the prosecution of horticultural activities, and many of the choicer trees and shrubs grow luxuriantly, reminding one of the sheltered gardens of Cornwall and Devon. Coniferous trees are a grand feature of many of the estates, and fruit culture is carried out on the best methods in most of the gardens, though there is much left to be desired in this direction on farms and in the gardens of the cottagers. The mere mention of Castlewellan, Fota, and Belgrove conjures up in the mind of a horticulturist visions of rare plants growing with wonderful freedom, collections of choice subjects that provide material for many a plate in the "Botanical Magazine," and make one think of Kew Gardens transplanted to a kindlier clime.

Horticultural and agricultural education are being extended in Ireland, and already the influence of capable teachers and scientific methods is to be seen—but this is a large subject, and merely mentioned to show that great things may be expected from Ireland in the near future, both in commercial and private gardening. Ireland has given us scores of our most beautiful roses, chiefly through the medium of Messrs. A. Dickson and Sons, of Newtownards and Dublin; it has given us rare hardy plants of many kinds, through Mr. Smith, of Newry; and it has introduced many a fine plant to cultivation, and flowered many a difficult subject, at the hands of that keenest of gardeners, Mr. Gumbleton, of Belgrove.

But it is not possible to cover the ground from Belfast to Cork in even one or two of these series of descriptive notes, therefore at present we must be content with brief notices of a few of those beautiful gardens that are in Dublin or within easy reach of it.

Powerscourt.

Bray is to Dublin what Brighton is to London, but it is less than fourteen miles from the Irish capital. Bray is the centre of a lovely district that includes parts of the counties of Dublin and Wicklow, and it is from Bray that one can the most readily reach Powerscourt, the seat of Lord Powerscourt. On the way to or from Powerscourt the beauties of the far-famed Dargle Glen should be seen. In the bottom of a thickly-wooded glen the impetuous Dargle river rushes on in most picturesque fashion; here and there the glen opens out, and more peaceful scenes are found, but in other places, squeezed between the high, tree-clad slopes of a deep ravine, the river roars along amid boulders in most romantic fashion. One spot, where, almost at the top of the ravine, a bold mass of rock juts out and hangs over the water far below, the scene is one to linger long over. This spot, known as the Lover's Leap, is described by one writer as "A huge rock projecting far from the glen's side, and overlooking right and left the still depths of the ravine. Shadowing and bending away in a densely-wooded slope, the opposite side of the glen rises grandly upwards; while, 300ft. below us steals the ever-present river towards the sea, the blue line of whose distant horizon rules the topmost branches of the trees away on our left."

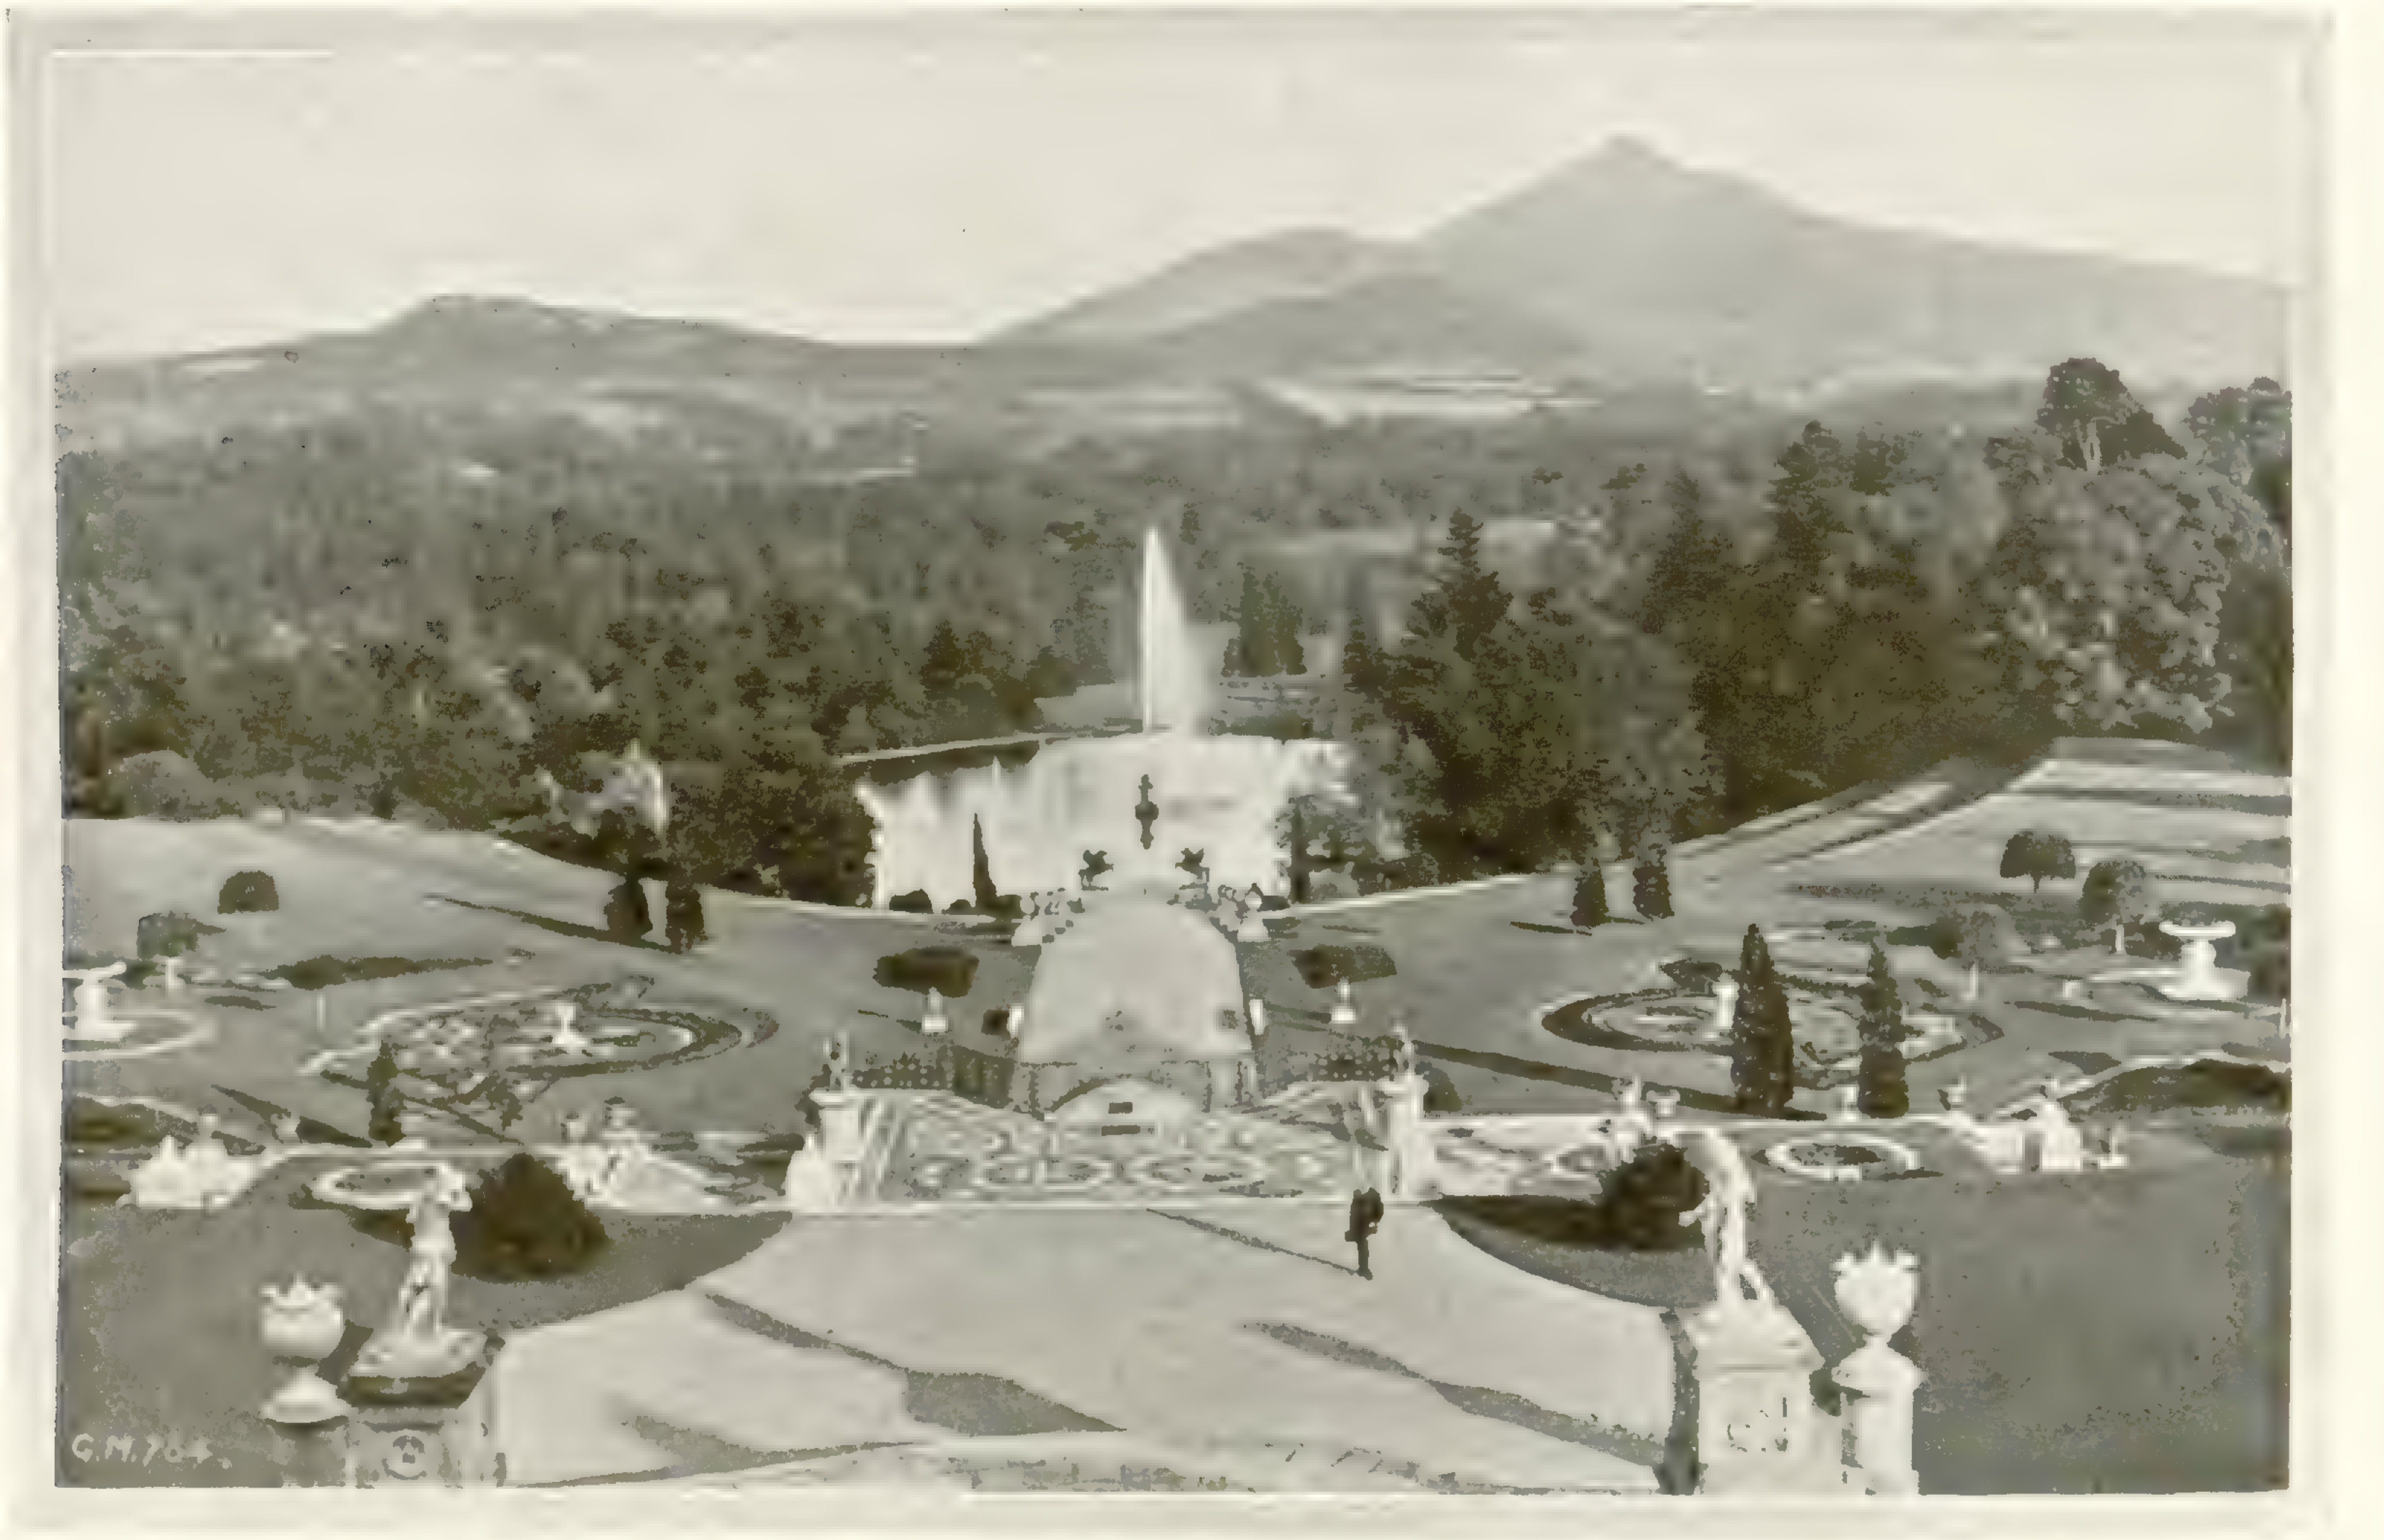
To the Dargle Glen is a favourite excursion of the people of Dublin and visitors to Bray, and another beauty spot that attracts as much as it is the Powerscourt waterfall in Lord Powerscourt's deer park. The grandeur of this waterfall depends entirely upon the amount of water in the Dargle river, and one can well imagine that when the river is burdened with water from the winter storms that gather on the hills beyond, the fall must be very fine. The deer park, peopled with deer and rabbits, and finely wooded with some grand old oaks, slopes gently towards a great mass of rock that rises very abruptly, and over which the river hurls itself from a height of 398 feet, the water falling about 200 feet before striking the rock, and thence glancing off into the rocky pool below. If the ascent is made to the top of the fall another grand scene spreads outward and upward, for the Douce Mountain at once rises to its full height of 2,384 feet, and beyond it are War Hill and Kippure Mountain, that mark the chief heights at this northern end of the chain of Wicklow Mountains.

The Powerscourt estate is one of the largest in this part of Ireland, and extends to between 25,000 and 30,000 acres. The mansion, a very large and substantial edifice, is set on rising ground, and commands superb views. From the terrace the grounds descend by curved steps to the sunken gardens, with their clipped Portugal laurels and series of flower beds, and then slopes away down to the lake below, where a piece of fine iron work commanded on either side by bronze Pegasus-like winged horses, by Hugo Hazen, of Berlin, gives entrance to the boathouse. Across the lake, amid fine trees and shrubs, the splendid view continues, and is carried over the farm lands beyond right up to the base of the Sugar Loaf Mountain, whose bulky, high cone occupies the centre of the picture, and dominates the whole scene.

On the north-east side of the mansion a large rose garden provides a pleasing feature. A part of the building, and the woods beyond, afford necessary shelter from cold winds, but the garden itself is also sheltered by its high enclosing hedges of the fragrant-leaved Penzance briars. A small, light pergola divides the garden, leading from either end to the little central fountain. Mrs. R. Sharman Crawford, Marie Van Houtte, Madame Levavasseur, Antoine Rivoire, George Nabonnand, and Gruss an Teplitz, are roses that highly appreciate the conditions provided in the beds, while among the climbers Dorothy Perkins was a wealth of bloom, and Alister Stella Gray clothed an arch in the most delightful fashion with its neat foliage and pretty yellow flowers. Hiawatha was also good, but Crimson Rambler is not an unqualified success here because of its liability to mildew.

The fine upper terrace at Powerscourt was designed by Daniel Robertson after the one at the Villa Bulera in Sicily, and it was commenced in 1843 by Richard, sixth Viscount of Powerscourt. The lower terrace and pleasure grounds were constructed by Mervyn, Viscount Powerscourt, in 1863-1872. From this it will be gathered that successive holders of the title and estates have each added to the grandeur and beauty of the place. The present Lord Powerscourt has carried out a great deal of planting, and the more recent additions include the bog and semi-wild garden near the lake, and the terraced rock garden.

The semi-wild garden, where everything is given ample room to develop, will presently be a fine feature. There are fine groups of Senecio clivorum and other giant groundsels, masses of Eryngium pandanifolium, eucalypti in variety, a grand example of Rhododendron Falconeri, breadths of Chrysanthemum maximum, colonies of hardy fuchsias, giant specimens of the Powerscourt variety of Phormium tenax, bamboos in great variety, a thriving loquat, any number of camellias, as well as specimens of Dicksonia antarctica, and tall dracaenas, and there are little ditches brimming over with the lovely Primula japonica, instead of with water, and margined with bold graceful masses of that king of hardy ferns, Osmunda regalis.



[Photo: Lawrence, Dublin.

BEAUTIFUL VIEW FROM THE TERRACE AT POWERSCOURT, CO. WICKLOW, WITH THE SUGAR LOAF MOUNTAIN IN THE DISTANCE.

The rock garden is hidden from general view, and is entered under an arch and between rocky walls. It is constructed on a sharp slope in the face of a big bank that dams back the waters of one of the lakes, and its treasures are explored by means of a path that zigzags from base to summit. There is a little artificial waterfall near the top, and in and round the pool that receives it arum lilies, hartstongue ferns, and the graceful Apera arundinacea are quite at home, in company with Primula japonica and P. pulverulenta.

Pursuing the pathway from the lake head through the pleasure grounds one finds fine specimens of many choice trees. Azara microphylla is particularly handsome. Fagus betuloides grows freely, and fruits here. Crinodendron Hookeri attains a fair size, and Drimys Winteri rises to a height of 12ft. The yellow-berried yew, Arbutus Andrachne, Abies Parryana glauca, Cupressus macrocarpa lutea, and Quercus fastigiata are other good things. Coniferous trees abound in the extensive grounds beyond the gardens proper. There is a long walk between fine specimens of Sequoia gigantea, there are grand groups of old Scots firs, big trees of Abies concolor, A. Douglasi, and a long avenue of Picea Pinsapo by the stream side on the way to the waterfall.

Within the walled-in garden, where the glasshouses are grouped, and where fruits and vegetables are well managed, flowers are also cared for, and there are herbaceous borders of great length and beauty. The walls shelter huge plants of the various ceanothuses, of Edwardsia microphylla (facing south), Romneya Coulteri, Magnolia grandiflora, Escallonia macrantha, Benthamia fragifera, Desfontainea spinosa, and Buddleia variabilis, the latter a perfect cascade of elegant spikes of its rosy flowers. There is also a fine arch of this handsome flowering shrub.

But one might go on for a long time detailing the attractions of Powerscourt, and if I conclude abruptly it is not for lack of material, because Mr. W. Owen, his lordship's head gardener, kindly showed me all that was possible in the time, and as the shades of evening fell he took me to the great waterfall, and back to Bray through the Dargle Glen. But what is half a day, evening included, for the inspection of Powerscourt?

Kilruddery.

A couple of miles or so from Bray is the entrance to Kilruddery, the Earl of Meath's beautiful estate. The residence, a fine old Elizabethan mansion, designed by Morrison, is a fine one, and contains a hall beautifully wainscotted with oak, and with a fine carved oak ceiling. The grounds are extensive, and, under the care of Mr Childs, the gardens are well kept. These latter should most certainly be visited by all garden lovers who find themselves in Dublin or Bray, and there is no difficulty in gaining entrance, as during the whole of the summer his Lordship throws them open from 11 a.m. to 6 p.m. every Monday, a privilege that is greatly prized and rarely violated.

There are several points of distinction about the grounds of Kilruddery, and the most striking are the hedges, the fish ponds, the Dutch garden, and the fine natural rock garden. Hedges are very plentiful, and some of them are remarkable for their size and age. In one part of the grounds the woodlands have been well thinned, and long straight walks have been cut through them, each having its dense sheltering hedge, usually of beech. There is one very long walk cutting through the whole of this area, with statuary at either end. At two points along this walk other paths radiate, and in each case one may stand in the centre of eight diverging pathways, all hedged and kept trim. The ground between these long hedged walks or vistas is filled with fine beeches, oaks, and limes. No matter whence the wind comes, or how hot the sun may be, one may find one or more walks that are sheltered from the storm or shielded from the sun, and perhaps it was for the shelter and quiet they provide that these high-hedged grass walks were created.

The old fish ponds are not exactly beautiful. There are two long ones, of rectangular shape, near the south front of the mansion, set in a broad and very long lawn, that extends to a circular pool and fountain. Of lawns there is an almost alarming area at Kilruddery, and the amount of time and labour occupied in mowing must be very great. Mr. Childs, his Lordship's head gardener for the past sixteen years, tells me there are thirty acres of lawns to be kept trim, and no one can know their extent better than he. They are beautiful lawns, however. On either side of the long vista that extends from the mansion to the deer park there are large groups of magnificent old limes and beeches, and these relieve the scene from any sense of flatness.

The Dutch garden on the east side of the mansion is some indication of the age of the garden. Here, along a raised walk, a fine lot of standard oranges are ranged, and from this walk the sunken garden, with its series of formal beds and its banked ends and sides, all flower clad, can be overlooked. A bright, though rather formal display is provided here year by year, and the aim is to keep this garden in the old style. Not far away is another little garden, enclosed with a beech hedge. It is a circular enclosure, and the hedge, pierced at intervals, has a length of about 180 yards, is 29ft. high, and must be of great age, as it is 18ft. thick at the base. There is a large pond in the centre, and all around are little beds, box-edged, and in intricate design, all filled with stones of various colours. Another bit of very old-fashioned gardening, and one that serves to remind one forcibly of the varied styles of gardening that have prevailed. Very different is the sheltered subtropical garden, where eucalypti, pittosporums, phormiums, tall dracænas, and trachycarpuses are quite at home amid the shelter of fine old lime trees.

The large rock garden is a natural one, that is to say, a large piece of rocky ground has been converted into a garden of alpine and similar plants by the simple process of baring the rocks here and there and filling in the crevices at other parts. Winding and ascending walks lead up to the top of this garden, and from the summit a grand view, right over the mansion, and commanding the Wicklow Mountains, is obtained. There is no need to detail the kinds of plants that clothe this rock garden, because practically all kinds of popular herbaceous and shrubby plants that [illegible] places for their home are grown. Rhododendrons, heaths, cytisus, and gorse are present in bold masses, and primulas, saxifrages, sedums, phloxes, gentians, and ferns in the shadier parts, abound. Very rare plants, and those that require a great amount of attention are not planted here, because the aim has been to keep the whole as natural as possible, and allow the subjects, once established, to care for themselves, except for occasional weeding, and severe thinning to prevent any one plant from crowding out its neighbour.

The fruit and vegetable garden and the glass department are grouped within walls, and they are all extensive and admirably kept. This part of the establishment is also very beautiful, as well as useful, as all the paths are flower-bordered, and in front, and at the ends of all the houses there are bright or interesting plants. There is one broad border kept very gay in summer time with large informal groups of pentstemons, self-coloured antirrhinums, violas, begonias, asters, chrysanthemums, herbaceous lobelias, gladioli, and pelargoniums. Each group consists solely of one variety. Carnations are well managed inside and out. At the back of the flower borders there are pillar roses and several specimens of Buddleia variabilis and B. v. Veitchi, these latter being very fine. Lonicera sempervirens also does splendidly in this garden, at the end of one of the houses. The vineries are well stocked, and they yield large crops, as well as some extra-fine prize bunches of Muscats and Black Hamburghs. Useful stove plants and a large range of greenhouse plants are skilfully cultivated, and peaches are very largely grown under glass. The long peach cases are of interest because all along the top of the case, next the wall, a half-pane space is left open all the year round, and Mr. Childs believes this ventilation very materially assists him to produce the large crops of fruit that are annually gathered. Bush apple trees are also well grown in this garden, and the walls are clothed with pears, plums, cherries, and peaches.

In conclusion, I must refer to the beautiful conservatory attached to the mansion. It is of fair size, but not specially large. Climbers are sparingly used, and the plants that are brought to furnish the structure are arranged on the floor in groups that vary in size and design, according to the subjects used, the taste of the decorator, or the wish of the employer. Beautiful statuary is associated with beautiful flowers, and a few tall palms and spreading tree ferns add their meed of stateliness and grace.

The People's Garden.

One of the finest public parks in the United Kingdom is Phœnix Park, Dublin, and the Irish capital may well be proud of its splendid open space. The park has an area of about 1,752 acres, and 1,300 acres are open to the public. Military re-

[Photo: Lawrence, Dublin.

THE POWERSCOURT WATERFALL, CO. WICKLOW.

views, polo matches, and cricket matches are held in it, consequently the park is a favourite resort of the fashionable world, as well as of the people. From the rising ground, by the Wellington Memorial, a fine view of Dublin City can be obtained.

The portion of the park that has the greatest attraction for us at present is that near the Dublin Gate, where a considerable area has been laid out to form a flower garden and pleasant promenade. There is a comparatively flat portion, where flower beds of varying size and shape are gay the summer long, and on one side of this the ground slopes away to a delightful little dell, where, near the water, are numerous bold waterside plants, the gunneras being particularly bold and attractive.

A broad border, in sweeping curves, was a notable feature of the flower garden last season. This, about 150 yards long, planted in ten long curving lines, produces a very bold and striking effect. The various subjects used were Fuchsia Riccartoni, Paul Crampel and Mrs. Pollock pelargoniums, Glory of Zurich salvias, centaureas, Calceolaria amplexicaule, Blue King, Acushla, and Gem violas, and blue lobelias, and Kœniga maritima. A long ribbon border of this character is not often seen nowadays, and though many garden lovers do not care for the style of planting here so well displayed, there was no question as to the delight and pleasure it gave to the visitors.

Some of the flower beds contained particularly bold arrangements, thus, Calceolaria amplexicaulis was associated with the tall Nicotiana colossea and Caladium esculentum. Weeping standards of Fuchsia elegans over the old Pelargonium Manglesi give a pleasing and soft effect. Rose of Castile and Mrs. Marshall fuchsias grouped over a groundwork of Kœniga maritima was another pretty and simple design. Fuchsias are favourites in the People's Garden, and so are violas, and both are used freely, and in various combinations, the former being grown as dwarfs, pillars, and standards. Paul Crampel pelargonium is another favourite plant, and here, as almost everywhere else, it grows and flowers finely.

The People's Garden is a fine idea, and the throngs of people who visit it on Sundays and half-holidays show how keenly the floral display here provided is appreciated by the public. It has been said that the good people of Dublin do not show a proper appreciation of horticultural matters, and certainly the fact that flower shows are not a financial success in the city—as witness the great Sweet Pea Show of 1908—lends emphasis to this view; but if they do not care to pay to enter a building for the purpose of seeing the finest examples of floral art and cultural skill, they flock to the outdoor display in the People's Garden. Perhaps the very name of the garden is a powerful attraction, and the idea that this splendid grouping of flower beds is for their special benefit draws the people quite as much as the flowers and plants themselves.

Charles H. Curtis.

*** The second of the two articles on Dublin's Gardens will be given in our next issue.

Nerines and Vallotas and other bulbous plants that have finished their growth should now be put on a shelf or other position where they can have a thorough ripening by the sun, but if the foliage is not quite died down give an occasional watering until it is quite gone.—T. S.

Sweet Peas that have been flowering indoors should now be put out, and in the case of some of the shy-seeding varieties, such as Mrs. Hardcastle Sykes, Audrey Crier, Frank Dolby, etc., etc., it is wise to plant out a few of them in some odd corner, thereby ensuring a good crop of early and well-ripened seed.—T. S.

LONDON PRIDE.

One ought almost to apologise for saying anything about such a humble plant as Saxifraga umbrosa, but it is still deservedly a favourite with the lovers of old-fashioned flowers. Its very name takes us back to times of rural simplicity, when town life was the exception and not the rule, and the comparatively few people who went Londonwards were proud of the fact. In Ireland, where it is plentiful in a wild state on the mountains of the south-west, it is known as St. Patrick's cabbage. Being an evergreen which looks well in all weathers, and growing, as it does, in any cold, damp soil, even where the sun never shines, it is not without value, and not only makes a good edging, but is useful on the rough parts of a rock garden.

A purpose for which it is most especially useful, however, is one for which we have none too many suitable plants, and that is as a surfacing plant for spring beds. It is true there are a good many plants which can be used for this purpose, but some are a bother to rear, some suffer in winter, and others are spoiled by being shaded by the taller plants of the beds. None of these objections attach to the London Pride, one good point about it being its extreme simplicity of propagation, all that is necessary being to pull some reserve plants to pieces in April and dibble them in rows in a shady nursery border, when each little piece will make a nice tuft by the autumn. Then the plants which are taken up when the bed is replanted at the end of May can be thrown away without remorse.

The pinkish panicles go especially well with yellow wallflowers, but the colour is so delicate, only the stamens giving it a pinkish tinge, that it will hardly clash with anything.

Alger Petts.

FOUNTAIN, FISHPONDS, AND MANSION, KILRUDDERY.

VILLAGE GARDENERS.

In every village in the country there are to be found men who may be described as natural gardeners, for the simple reason that gardening is part of their very nature, and they are imbued with a love for horticulture which their fellows do not possess. In the earning of their daily bread these men follow all sorts of occupations, but spare time and spare money are spent on the one hobby—gardening. Would that the country could boast of more of these fellows, who are not only good gardeners but good citizens, worthy members of the community to which they belong, independent, self-reliant, and commanding the respect of everybody who has dealings with them. Perhaps these men would be equally good citizens if they had no gardens to take a pride in, but I cannot help thinking that their hobby helps to bring out their best qualities, for no keen gardener was ever a loafer, or a supporter of street corners, and the simple reason is that he has something more interesting and profitable to occupy his time.

The village labourer who enjoys a local reputation as an expert flower or vegetable grower, is generally a character in his way, perhaps a little conservative in his ideas, proud of his skill, and none too ready to impart the secrets of his success to others. If you ask him for particulars of his methods in the cultivation of this or that crop, he not infrequently answers in a roundabout sort of manner that does not convey much except the impression that, in his little way, he has trade secrets, and does not see any reason for giving them away. His garden, however, is his pride, his joy, in fact, the delight of his life; and, if he displays certain reticence in describing how he does it, he will talk gardening as long as you like to stop with him, welcome you within his domain, pump you for an opinion regarding any loss or failure, and show you with a touch of just pride the result of his labours.

The great feature about the village expert is his intense enthusiasm. In a word, he loves his garden, and shows his affection in a score of different ways. Let me illustrate a case to show what I mean. Last summer, in the course of a round of judging, I inspected one of the best cottage gardens it has ever been my good fortune to see, and it belongs, by the way, to an agricultural labourer whose average earnings do not exceed fifteen shillings a week. The man's wife showed me round, and, in answer to a remark that her husband must be fond of his garden, the good woman exclaimed: "Fond! I should think he is, for I hardly ever see him." Pressed for further explanation, she went on to describe how her better-half turned out of bed in the spring and summer almost as soon as it was light, and did a few hours' gardening before starting work at six o'clock. "As soon as he gets home at night," the woman went on, "he swallows his tea, is gardening again till he can see no longer, and then he goes to bed." It is not alone the cultivation of vegetable produce for the supply of his household that prompts this man (and scores of others of similar type) to work as he does in the garden. Not a bit of it, and the truth rather is that the man loves gardening for its own sake, derives pleasure out of it, and in his way is as true a devotee to horticulture as any possessor of the Victoria Medal of Honour. Men of this type are in want of no Daylight Saving Bill, because they never waste any daylight, nor moonlight either for the matter of that, for they often take advantage of a full moon to do a bit of trenching in the winter when the days are short and the evenings and mornings long and dark.

You may notice in a village how all the cottage gardeners start about level in the spring, by right of custom about Easter time; but to some the gardening is a matter of duty or obligation, and to others it is a labour of love. They all start level, but go round the village a month or two later and note the difference. Here is a plot that was sown and planted, but it has gone weedy, untidy, and presents a neglected air that is unmistakable. Its owner is profuse in his excuses, he has had no time, has been working late, or something else has prevented him looking after his garden. No excuses of this kind are forthcoming from the natural gardener, for, if he has no time, he makes time, and contrives by a way of his own to keep the garden up to the mark, even though hours of sleep are sacrificed in order to do it. To a cottager who really loves his garden, it is a source of real worry if things go wrong, and he is prevented by illness or other unavoidable cause from keeping the place tidy and shipshape; but in this matter there is a certain amount of freemasonry amongst village enthusiasts, and it is not infrequent for one to go and give a neighbour a turn when the latter is laid aside by infirmity, whereas under ordinary circumstances the men may be keen competitors, and perhaps jealous of each other in their heart of hearts.

At the annual flower show the village expert is very much in evidence, first in the early morning, when, with the assistance of every member of his family, he is getting his stuff in, and wears an anxious look, and again after the judges have made their awards, going round the tent with a well-thumbed schedule and a half-inch

[Photo: Lawrence, Dublin.

THE CONSERVATORY, KILRUDDERY.

stump of lead pencil, ticking off the prizes he has won. He may pause now and then and run his fingers through ruffled hair, which is an indication that he does not see eye to eye with the judges, but, as a rule, the keen gardener knows how to lose as well as to win, and he accepts the decisions of the adjudicators with good grace. It is a goodly sight, my friends, when the sun is setting on the village show day to see our friend, now dressed in the suit he was married in and only dons on special occasions, stepping up to the bandstand to receive his prize money from the hands of the lady of the manor, and, as he murmurs his thanks, he touches his forelock with a hand that is horny through honest work, and then falls back to receive the congratulations of his friends. He is respectful to a degree without being servile, he has done his best, and knows it, and if he indulges in an extra pint of beer afterwards, who shall blame him? One wonders where village societies and flower shows would be without these born enthusiasts, and when you hear one of them talking about "our show," you may depend that he is discussing an institution in which he takes a real and personal interest. If the society holds monthly meetings, as well as an annual show, it is the keen cottager, who, after a long day's work on the land, cheerfully shoulders a basket of vegetables, and tramps two or three miles along muddy lanes, merely for the sake of boarding the results of his labours, and adding his little item to the interest of the meeting.

PEOPLE'S GARDEN AND OBELISK, PHŒNIX PARK, DUBLIN.

[Photo: Lawrence, Dublin.

The village expert is a living illustration of the triumph of thoroughness and hard work in the cultivation of crops. He is practical to his finger ends, and scientific without knowing it, because he has learnt from experience the value of those methods which true science teaches. He knows the need of manure, and gets it by hook or by crook, and he realises, perhaps more than many scientific men do, the part that the spade plays in successful gardening. He has no substitute for this indispensable tool, which he uses as it should be used, and in the development of his crop pays that attention to details which is absolutely essential to success. In a word, he is a worker, and, after all, successful gardening depends more on muscle than on anything, because, if there is anything faulty with actual tillage, all the science in the world will not make good the deficiency.

It is interesting to observe how keen the ardent cottager is on getting the best varieties of vegetables for his garden, and, if a tradesman serves him well, he swears by that individual at all times and in all places. Not infrequently, however, he is reticent about the peas, onions, potatoes, etc., with which he wins prizes at the show, and has a peculiar habit of conveniently forgetting their names if this information is sought by a fellow competitor.

It is true they have their failings, these village gardeners, and are not without their peculiarities, but, taking them as a whole, they are the bedrock of the nation, and would that there were more of them. Work is scarce indeed when these men fail to get it, because employers can depend on them, and know their worth, and if you compare their sturdy figures, well-knit limbs, and bronzed features with the weakly frames and wan faces of the men who hang about the street corners in every town, you must agree that the country village is the place to breed manhood, and a garden or allotment, provided the individual has a horticultural bent, does more than a little to develop intelligence, and create in the human being a healthy spirit of contentment.

G. H. H.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price 1s. 6d. net, by post 1s. 9d.; cloth, 2s.; by post 2s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

STRAWBERRIES.

I recently inspected a grand batch of strawberry plants in full flower, growing in a very light soil; the plants gave good promise, and will, if carefully mulched and watered, bear a fine crop of luscious fruits. I have grown excellent crops of berries in the sandy soil around Southport by paying attention to watering and mulching, but the flavour of such crops is, as a rule, inferior to that of fruits grown in a heavier loam, such as obtains round the Swanwick and Botley districts in Hampshire.

The variety Laxton's Noble, with me, came light red in colour in a heavy soil in South Hampshire, while in a peaty loam at a distance of about five miles the fruits were almost black, but practically flavourless, whereas my light red fruits were of good flavour for that particular variety.

With care and constant attention at this season very satisfactory crops can be grown in light sandy soils, but over-dryness at the roots must be guarded against, as when once the plants flag at this season, loss of flavour of fruit is sure to result. I have seen the soil so hard in some of the Swanswick strawberry fields at gathering-time, after a spell of dry weather, that the wheels of farm carts made no impression on the surface of the headlands. The crops of fruit in the many fields were extremely good, and the plants in robust health, notwithstanding the long period of dry weather. The plants had been well cultivated. One grower told me that he used the liquid from the tanks of slaughterhouses, which consisted of water, blood and liquid manure; the plants being well fed with the mixture while they were growing freely, in addition to enriching the soil with organic manure at the time of planting. The cost per acre, I was not able to ascertain, but I was quite convinced that it was not at all alarming, especially in face of the fact that the grower in question had cleared one hundred pounds per acre. Royal Sovereign was the variety grown.

G. Garner.

EARLY CAULIFLOWERS.

One of the most delicately flavoured of all the brassicas is the first early cauliflower of the season. Very frequently no such delicacy is seen until the end of June, and occasionally even July is reached before heads are sufficiently large for use. The cauliflower has always been looked upon as a superior vegetable, and more especially so if it could be had before peas, early outdoor carrots, turnips, etc. For the past twelve years, whatever the climatic conditions may have been, we have always had a few cauliflowers from the open during the last week in May, and, commercially, have always had excellent returns all through June as the heads matured.

It is quite true, as so often stated, that good cauliflowers cannot be produced upon very poor soil, for unless growth is free during the early stages, with many of the smaller early selections premature hearting takes place, therefore it always pays to give a little extra attention in the matter of raising the plants and hardening them before planting in the open during early April. We have tried a good many varieties for early use, such as Snowball, Dwarf Erfurt, First Crop, French Frame, Early London, Magnum Bonum, and others, and we have sowed seeds in every month from September to February, and have had the best results from mid-November sowings. Pans of ordinary soil from the garden answer well for sowing the seed in at that season, and quite cool treatment is essential. When the seedlings are making their first true leaf is a good time to prick them off into boxes, or cold frames, or to pot singly into three-inch pots. The latter give the best, or at least the quickest, returns, and the plants do not suffer when transferred to the open garden. In the South of England the plants will withstand much more cold than is generally supposed, and often in quite open positions are superior to those grown under the shelter of walls or between the rows of peas or other early crops.

For a good crop of white, solid-hearted cauliflowers of either private or commercial value I cannot find anything that equals Magnum Bonum, and always grow large quantities of it. The smaller First Crop section is more suited for the earliest use in private gardens, and to have them good they must, in their early stages of growth, have nitrogenous stimulants in some form to encourage leaf growth, which is very scant in these small forms. I fear the healthy rivalry that years ago stimulated a desire on the part of gardeners to be first in the production of early vegetables, has, to some extent, declined of late years, but if a National Vegetable Society can be formed that will set up a national desire to do better all round, a great amount of good will be done to a cause of great national importance.

ROCK ROSES.

The natural order Cistaceæ consists of a large number of species with a few notable varieties, and many of them are among the most beautiful of flowering shrubs, as they are singularly well adapted for certain positions in gardens. Not all of them are of unquestioned hardiness, yet so easily can their particular requirements be supplied that it is surprising they are not more generally cultivated. Cistuses are evergreen shrubs, indigenous to warm, dry soils, chiefly of Southern Europe, and it is not unlikely that the common name of rock rose is derived from a natural disposition of the genus to establish itself under such conditions as would suggest the name. However that may be, cistuses are true rock roses in English gardens, as they enjoy a dry, stony root run, where the soil is rather poor.

Rich soil is against success, as the development of the plants during summer, in consequence of abundant food, results in vigorous sappy growth, which cannot mature except in warm localities or under favoured conditions, the consequence is that most of the wood succumbs to the first rigours of winter, and it not infrequently happens that the plants themselves perish. In some districts it would be perilous to attempt establishing the rarer forms in ordinary shrubberies; positions well sheltered from cutting winds should be selected, and the ground, if not naturally porous, should be supplied with thorough drainage, employing soil that is light and stony, and planting as firmly as is consistent with safety to the roots. Raised ground, such as banks, may be instanced as where they generally succeed, and I have always found them do well on dry walls, where the growth made each year is short and stocky, conditions which not only ensure abundance of flowers, but almost guarantee immunity from the bitterness of winter.

For walls I prefer planting them when quite young, during early spring, generally employing plants established in pots which have been rooted from cuttings taken the previous autumn. Those which I have found to succeed in this district include C. florentinus, C. laurifolius, C. lusitanicus, C. monspeliensis, and C. salvifolius, all of which bear white flowers; those with reddish flowers include C. crispus, C. purpureus, and several forms of C. villosus. C. ladaniferus immaculatus requires wall protection here.

As the foregoing notes are equally applicable to the shrubby helianthemums, and as many of these, in their colour and delicate texture of petal, are even more lovely than the cistuses, I mention the species found to succeed here; all of them are evergreen, and the majority assume a more or less erect habit of growth: H. alyssoides, H. formosus, H. formosus unicolor, H. kalimifolium, H. libanotis (rosmarinifolium of gardens), and H. ocymoides (algarvense).

◆

Production of Hybrids.

An example may now be given which shows us how, under certain circumstances, we can obtain a hybrid exhibiting an entirely new combination of characters, which, in spite of its hybrid nature will continue to breed true.

Suppose a gardener had only two kinds of peas, one with round green seeds, and the other with wrinkled yellow seeds, and that, as usual, he wanted something that he hadn't got, say peas with wrinkled green seeds. Mendel has shown us how he may get what he desires, both surely and speedily, from the material already in his possession.

The necessary procedure will be evident from the following scheme:

Let R = round, W = wrinkled, Y = yellow, and G = green. We know from previous experiments that R is dominant to W, and Y to G.

R G crossed with W Y, gives the hybrid, R (G) (W) Y, which owing to the dominance of R and Y will appear in the form of round yellow seeds. That is not what our gardener wants, and if he knew no better he would naturally be much disappointed with the result. If, however, the hybrids be allowed to fertilize themselves and reproduce, then their offspring will appear in the proportions:

9 R Y : 3 R G : 3 W Y : 1 W G

This is a case of what is termed dihybridism, in which two pairs of contrasted characters, or allelomorphs, are concerned. The proportion 9 : 3 : 3 : 1 exhibited in this case is partly due to the phenomenon of dominance, and will be readily understood from the accompanying table:

Germ cells → ↓	R Y	R G	W Y	W G
R Y	R Y R Y	R (G) R Y	(W) Y R Y	(W) (G) R Y
R G	R Y R (G)	R G R G	(W) Y R (G)	(W) G R G
W Y	R Y (W) Y	R (G) (W) Y	W Y W Y	W (G) W Y
W G	R Y (W) (G)	R G (W) G	W Y W (G)	W G W G

The constitution of the hybrid is R G W Y. Each of its germ-cells or gametes contains one character, and one only, from each contrasted pair. It may, therefore, contain R + Y, R + G, W + Y, or W + G. These different kinds of germ-cells will occur on the average in equal numbers, and on self-fertilisation (R G W Y × R G W Y) they will unite in pairs at random. The possible ways in which such union may take place are shown in the table, and if allowance be made for the phenomenon of dominance, in accordance with which G disappears from view whenever it meets Y, and W whenever it meets R (as indicated by the brackets in the table), we get the apparent proportion of 9 round yellow seeds, 3 round green seeds, 3 wrinkled yellow seeds, and one wrinkled green seed. The number of wrinkled green seeds will be small at first, but they will breed true, containing as they do only the extracted recessive characters, for if a dominant character were present it would necessarily show itself.

Thus we see that one way of producing new forms of plants and animals is by the artificial combination of desirable characters which already exist in different varieties. These elementary or unit characters can be brought together by the process of hybridisation, and new organisms produced in much the same way as the chemist is able to produce new compounds by analysis and synthesis from other substances.

Burbank's Work in Plant Breeding.

Probably no man has made more successful use of the process of hybridisation in the production of new and valuable forms of plant life than Luther Burbank, at his celebrated Californian nurseries. Burbank himself is unfortunately not a writer, and for a scientific account of his work we are indebted to the distinguished botanist Hugo de Vries. In his delightful little book on "Plant Breeding," Professor de Vries describes what he himself saw and heard during his visits to Mr. Burbank's farms. It is not necessary for me to enter into details with regard to the marvellous results which Mr. Burbank has obtained. Some idea of their commercial value may be formed from the fact that special companies have been formed for the propagation and sale of some of these wonderful hybrids. White blackberries, stoneless prunes, "plumcots," and thornless cacti are only some amongst the many novelties which he has produced by crossing different varieties by hybridisation and thus combining two or more desirable qualities in one plant.

Take, for instance, the case of the stoneless prune. It had somehow or other come to the knowledge of Mr. Burbank that about 200 years ago there existed in France a plum known as the "Prune sans noyau." He succeeded in obtaining specimens of this fruit, but it proved to be of little or no commercial value owing to its poor quality. Its one valuable feature was its stonelessness, and Burbank set to work to transfer this character, by hybridisation, to a variety of good quality. He succeeded, and there appears to be no reason why the stoneless character should not be similarly implanted upon all the different varieties of plums now in cultivation.

Similarly the "plumcots" are hybrids between plums and apricots, which Professor de Vries speaks of as "most delicious and beautiful fruits."

It must be admitted that Burbank's work is practical rather than scientific. He apparently pays no attention to the law of Mendel in his operations, and just goes on hybridising until he gets what he wants. In this process enormous numbers of plants which do not fulfil his requirements have to be destroyed for every one that is worth preserving.

He is not necessarily concerned with the production of pure breeds; of forms, that is to say, which will breed true from seed, or in other words, of forms which will hand on their desirable qualities to future generations by heredity. This does not matter in the case of fruit trees and other plants which are propagated by buds independently of sexual reproduction. As a general rule, a fruit tree cannot be relied upon to come true from seed, the characters which it has received from different ancestors not being permanently combined, but separating out and undergoing fresh combinations in the sexual process, probably in accordance with Mendelian principles. The seedlings will therefore be "degenerate," as horticulturists say, and will no longer exhibit those valuable qualities which depend upon the confluence in one individual of several lines of ancestry.

The operations controlled so successfully by Luther Burbank are to a certain extent similar to those which take place in a state of nature. He produces a great variety of new forms and from these he selects what he requires. The process results in enormous waste, but so also does the process of natural selection. Under natural conditions waste of life is a necessary condition of progress.

The majority of Burbank's productions, however, could not survive in a state of nature at all; they are essentially artificial, and have to be artificially propagated by means of buds or cuttings. In this respect they are quite different from the pure races which it is possible to produce by hybridisation carried out in accordance with Mendelian principles, in which new and permanent combinations of unit characters, capable of being transmitted by heredity, are effected.

(To be continued.)

THE FOLIAGE OF VIOLAS.

Looking over the latest volume of the Gardeners' Magazine I came across the interesting notes on the above subject from Mr. William Cuthbertson (page 871, 1908). This matter of viola foliage and habit should appeal to all who are interested in this useful flower as a bedding plant. It was a happy idea to institute the trials at Marks Tey, for it seems to me we have brought our varieties into a serious muddle lately, as very few growers take the trouble to classify them, as they should do, into two distinct sections, i.e., bedding varieties and exhibition varieties. The result is that many varieties planted for effect prove ghastly failures, as they are frequently bought from catalogue descriptions, which throw very little light on the habit of the plant.

Again, I fear that hundreds of plants are sold, nay, thousands, by selections at exhibitions. The trade grower cannot be blamed for this, for unless so exhibited the general public would never see them, but, unfortunately, in most cases they are exhibition sorts only. The bedding varieties, if staged, would suffer severely by comparison, the consequence is that the best bedding violas are rarely seen at public exhibitions, and it is only when good trials are instituted, and carried out, that one has the opportunity of forming a useful judgment. Although raisers were invited to send varieties for bedding purposes to the Marks Tey trials, it was quite evident some of those sent were fit for show purposes only, and not at all suitable for producing a mass of colour. When at Marks Tey last June I marked my note book carefully as to the habit of each variety receiving three marks, and I find on reference to it that the varieties mentioned by Mr. Cuthbertson as being excellent in November were equally good in June. It is surprising to note the difference there is in habit of growth, though all may be dwarf. The varieties that keep breaking away into new growth, such as Ardwell Gem and Duchess of Fife, form my ideal of a bedding viola, though this type does not flower quite so early in the spring as one could wish; but when used as a carpet for taller plants in summer they produce a much neater appearance than do taller growing sorts.

The hardiness of the varieties for this purpose is certainly a matter for great consideration, as where the beds are made up in the autumn, and present a gappy appearance in the spring, it destroys the effect of the bed. Perhaps in the near future the trade growers will see their way to separate the two sections, so that there will be no good cause for disappointment on the part of those people who purchase exhibition sorts, and use them for bedding purposes. Some of the former will grow two feet long in the season without branching out at all, and their appearance in the garden is anything but desirable.

Chingford. J. B. Riding.

There is no better guide to the kitchen garden than Vegetables and their Cultivation, by T. W. Sanders. It is a complete treatise on the general management of the garden, and the successful culture of vegetables, saladings, and herbs for home use. Price 5s. net, by post, in box 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

SWEET PEA JOTTINGS.

All ardent lovers of sweet peas are now paying close attention to their plants, and taking in them a great deal of interest. The warm days of the Whitsuntide holiday, following the wet days of the Temple Show, caused sweet peas to grow splendidly, and since we have had more rain and more cool weather. The plants look well, but there is a strong tendency on the part of many of them to come very early into bloom. When the ground has been heavily manured, and watering and feeding are practised, this early flowering is of some benefit, as it will check rankness of growth and coarse flower stems, but where ordinary conditions of culture prevail, early-flowering is a rather severe check upon the ultimate growth of the plants.

Autumn-sown sweet peas are flowering splendidly now out of doors, and some good displays of these blooms were made at the Royal Horticultural Hall last Tuesday week. Mr. E. W. King sent me a few splendid blooms of Mrs. King, and of his waved white last week, and on the occasion of the General Committee meeting of the National Sweet Pea Society on Friday, Mr. T. Stevenson brought up some very beautiful flowers of the newer varieties, including his large and handsome waved form of America, the stock of which will, I believe, be sent out from Birmingham.

The new Edrom Beauty is a lovely sweet pea as I saw it last autumn at Mrs. Malcolm's home at Duns, but I am rather disappointed with it as grown under glass and shown by Messrs. Dobbie and Co., who hold the stock. I regarded it as a glorified Helen Lewis, a variety with more orange in it, but at present it seems a trifle pale. However, we shall see what it can do out of doors in the South. Mrs. Andrew Ireland is a sweet pea that took my fancy the first time I saw a flower of it, and as a generally useful and extremely beautiful variety I am confident it will hold a very prominent position. Miss Hemus's Zarina is a charming sprightly pink variety with dark stems, and though it may lack exhibition size it is sure of a considerable degree of popularity as a decorative variety. I do wish Miss Hemus would not label so many of her varieties with the "Paradise" prefix. Paradise Apple Blossom carries too heavy a title, and such a clever lady could have found a prettier name for the rosy bordered flower that gained an A.M. on June 8.

Turning to cultural matters, the chief work at present is tying out the growths so as to distribute them as evenly as possible. Hoeing between the rows and in the lines needs attention, and as soon as we have warm weather a heavy mulching will be necessary. Those who mulched heavily at an early date will, I am afraid suffer somewhat owing to the heavy rains and cool—sometimes quite cold—weather experienced since Whitsuntide. The cold nights have left their mark upon the leaves of some varieties, notably upon those that produce salmon and orange flowers, many of the lower leaves showing a peculiar bleaching along their margins, just as the older leaves did in April when cold weather followed planting.

Tiny black slugs are a great nuisance, but the cool weather seems to have held them in check a little, so that frequent applications of old soot, or air-slaked lime, carry on the work of execution between the rains. What we want now is genially warm weather, and if this comes soon the southerners will find no difficulty in competing on July 13 and July 23, because, with the ground thoroughly soaked, growth will then be very rapid and strong.

The outings of the National Sweet Pea Society have been fixed for July 9 and July 16, both Fridays. On the first date the visit will be to Messrs. Cooper, Taber, and Co.'s grounds at Witham, thence to Mr. Wm. Deal's place at Kelvedon, and from there to Messrs. E. W. King and Co.'s seed farms at Coggeshall. Members of the society wishing to join the party must notify the hon. secretary on or before July 1, so that arrangements can be made for cheap tickets from Liverpool Street to Kelvedon and back. The second outing, on July 16, is to the Society's Trials at Reading University College, where there are over three hundred stocks and varieties growing.

Chas. H. Curtis.

PRUNUS PADUS VAR. FLORE PLENO.

Of the numerous forms of the "Bird Cherry" (Prunus padus), the one with double flowers is perhaps the most beautiful, for its pendulous racemes of pure white flowers are larger than those of the type, or other varieties, and the flowers, being double, are of a less fugitive character than are those of the single-flowered varieties.

When not in bloom it would excite little notice, and would pass for a vigorous specimen of the type. During the latter part of May, however, when it is laden with racemes six to eight inches long, it forms an extremely ornamental tree, and is worthy of consideration for planting in a prominent position. Like others of the species, it is not at all fastidious with regard to soil, and gives good results in that of a poor character, although, of course, it assumes larger proportions in better-class material.

The bird cherries in general are excellent trees for plantations or groups in parks, for they grow quickly, and rarely fail to flower profusely. A number of varieties, in addition to the one mentioned, are known. Of these Alberti is a very free-flowering form: aurea has yellowish leaves: pendula has weeping branches; and stricta is of stiff, upright habit. The variety known under the name of sibirica parviflora should be avoided, as it is very much inferior to the type, the flowers being small, and the racemes short.

SCOLOPENDRIUM VULGARE CRISPUM MULTIFIDUM.

An elegant variety shown by Messrs. H. B. May and Sons at R.H.S. Meeting, June 8, when it received an Award of Merit. (See New Plants.)

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

PHAIUS.—Many of the early-flowering species, and tuberculosus section of hybrids, such as P. Norman, P. Cooksoni, and P. Clive, will now have advanced their growth to a stage when the new roots are being produced, and when in this condition we find it best to repot. We usually repot all the plants of this section annually until they have developed into large specimens, after which, if a good lasting compost is used, the plants will remain for two seasons in the same compost. When repotting, care should be observed in turning the plants out of their pots to see that as little damage as possible is done to the roots which have become attached to the inside of the pots. I find it a good plan to water the plants thoroughly a day before they are to be potted, and if this is done it will be found that the roots can be detached much more readily than when the compost is dry. When they have been turned out, all dead roots and decayed matter should be removed, and where there are a number of leafless back pseudo-bulbs these should be severed. The latter may then either be potted separately or replaced in the pot with the other portion of the plant, and by this means the size of the specimen will in time be increased. In any case I consider back pseudo-bulbs should be removed, as there can be no doubt after they have lost their leaves, and root action has ceased, they obtain their support from the leading portion of the plant.

POTTING COMPOST.— The pots used should be clean, and filled to about one-third their depth with clean drainage. When in full growth these phaius require a liberal supply of root moisture, it is therefore desirable that the pots are properly drained, thus preventing any possibility of stagnation. The potting compost we find suitable consists of about equal portions of fibrous peat, turfy loam, broken leaves, and chopped sphagnum moss, with a plentiful supply of broken crocks and sand. This compost should be made firm, loose potting in my opinion is a mistake for this section of phaius. The plants should be watered, thoroughly wetting the compost through as soon as repotting has been completed. Carefully shade the plants from strong light until the new roots have become re-established in the fresh compost. The atmosphere, while not necessarily hot, should be such as will assist growth development. It is well to shade fairly closely at all seasons, and to admit ample ventilation, thus hardening the growth. Syringe or spray nightly overhead whenever the outside conditions permit.

INSECT PESTS.—Scale and thrips must be held in check, the former by cleaning with the sponge, the latter by spraying and vapourising at regular intervals. Thrips are the greatest pests, especially when the plants are in the early stages of growth.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CONSERVATORY.—Climbing plants in the conservatory must at this season be regularly attended to in the matter of tying and keeping clean, and in some instances thinning of the shoots must be resorted to, especially in the case of cobæas, tacsonias, and other very free growing subjects, as nothing looks worse than a great tangle of growth, robbing plants beneath them of necessary light. Take every opportunity, when the family is not at home, of giving the conservatory a thorough clean out, and an occasional fumigation will do good. The conservatory should now be very gay with hydrangeas, fuchsias, cannas, Humea elegans, clarkias, etc., etc., these latter proving each year their great usefulness in the conservatory.

VIOLETS that were planted out as advised in a previous calendar will now be making good growth, as the rains in the early part of the month have greatly benefited them. Keep the hoe going regularly among them, and a weekly or bi-weekly dusting of soot will keep the foliage healthy, and stop the ravages of red-spider, which is their greatest enemy during a dry spell.

CLIMBING AND WEEPING ROSES in pots will now be going out of flower, and there is no further need to keep them indoors. They should be stood outside in a sunny position, and all the old wood may be cut out to the point where good young shoots are pushing forward; select three or four of the latter, or, in the case of weeping varieties, six or seven, rubbing or cutting out all the others, and if the plants are liberally supplied with liquid manure, and well syringed overhead on all fine days, they will be well suited for flowering in pots next season. For very early flowering it may be best to keep them indoors, and induce them to make their growth quickly, afterwards putting them outside to ripen their growth, but this is not really necessary, as such varieties as Dorothy Perkins, Hiawatha, Mrs. F. W. Flight, Electra, and Tausendschon make and ripen their growth very quickly, and this latter is the chief essential for successful flowering in pots.

SAXIFRAGA PYRAMIDALIS.—Offsets should be removed from plants grown in pots, dibbled into boxes of light soil, and placed in a cold frame, where they may have a little shade until rooted. Older plants that have not flowered this season should be shifted into 48-sized pots, and they should make good specimens for next season. This is one of the most useful and easily grown plants I know, and if a number of offsets are taken off as advised each season, they will provide a nice show of bloom with quite a minimum of trouble.

PRIMULAS AND CINERARIAS.—Young plants of these must be handled as soon as ready, either potting off into thumbs or pricking off an inch or two apart in boxes. Primulas will require a little warmth at night to keep them growing freely, but the cinerarias must be treated as cool as possible.

WATERING AND AIRING.—Plants generally will now be needing an abundance of water, and it is quite wise to give them plenty, not waiting till they are really dry, but rather anticipating their wants in this respect. All free-growing subjects, such as fuchsias, liliums, begonias, celosias, etc., that are well rooted in their flowering pots, should have frequent applications of liquid manure. All plants that can be syringed should be so treated regularly, and where they cannot be syringed overhead many of them will be benefited by having the stages and floors well damped down once or twice during the hottest part of the day, but this must not be done too late in the day in the flowering house.—Thomas Stevenson, Woburn Place Gardens.

THE FLOWER GARDEN.

THE WATER GARDEN.—Perhaps there is no part of the pleasure grounds where water is in existence, be it ever so small, that is more appreciated during the summer and autumn months than that devoted to the cultivation of choice water and bog plants. When judiciously planted and carefully managed it is not only attractive, but highly interesting. Anyone contemplating either renovating or making a new water garden will do well to note the flowering time of the various kinds adapted for this purpose. The finest of the newer varieties of nymphæas rank amongst the most important, and notes should be made of the most distinct. It is well to remember that the larger the growth of the variety the greater the depth of water will they succeed in. I have found three and four feet none too deep for the stronger varieties, and the miniature ones will do quite well in a depth of from eight to twelve inches. Orontium aquaticum, commonly known as Golden Club, is a charming plant which has been flowering for the past month and is still in great beauty. This should be planted in about eighteen inches of water. Pontederia cordata, known as the Water Plantain of Jamaica, is one of the finest of all blue flowers. Plant in about the same depth of water, flowers later on in the year. Aponogeton distachyon, the Water Hawthorn, should be planted in about twelve inches of water, and will flower for quite six months out of the twelve. The great difficulty in relation to these is to keep the water free from weeds and vermin, especially water rats, and wild fowl can only be allowed in moderate numbers. At this season it will be necessary to free the plants from all weeds about once a fortnight, and to take care that the stronger growing waterside plants, such as typhas of various varieties, phragmites, acorus, cyperus, carex, etc., do not monopolise too much space. If this is not done they will quickly take possession of that which has been reserved for the slower and in many cases more beautiful kinds.

IRIS KÆMPFERI (the Japanese Iris).—Possibly there are no more lovely plants when in flower than the varieties of this iris, and when in full vigour they will continue to flower more or less throughout the summer months. Though in many cases they will do well quite away from the water side, in my opinion they never look so well as when grouped together on the margins of water. It is a capital plan at this season of the year to apply a good dressing of half-decayed cow manure, and it will be necessary when the plants are very vigorous to support the flowering growths if occupying exposed positions. Iris sibirica also makes a lovely show when planted in the same position, though the flowering season is of short duration.

PANSIES AND VIOLAS.—Seeds of these charming spring and summer flowers should be sown during the present month. Select a shady position, and sow the seed thinly on a sandy surface, and prick out into rows six inches apart in a similar place when large enough. Violas in flower should have their seed pods carefully removed immediately the flowers are past their best.—E. Beckett, Aldenham House Gardens.

HARDY FRUITS.

STRAWBERRY RUNNERS.—Have a sufficient number of three-inch pots washed, and when dry place one piece of crock at the bottom of each, and fill up the pots with some fairly good soil, pressing it in rather firmly. Select a number of pebble-shaped stones for holding the runner in place, or, what we find better still, cut some pieces of galvanised wire in three-inch lengths, bending down an inch at one end to form a hook or peg, as these hold the young plantlet firmly in its proper position, and are easily removed when the plants are shifted into their fruiting pots, or when planting them out into their fruiting quarters. These pegs if taken care of will last for years. As soon as the runner is ready for layering, pinch out the point of the growth beyond, and place it in the centre of the pot, and peg it firmly in that position; when sufficient runners have been secured cut away all the remainder. The soil in the pots must be kept moderately moist, and if the weather should remain dry, let the old plants have frequent supplies of water until the runners are ready to be removed.

GRAFTS.—In most cases the young scions are growing away freely. Remove the clay carefully, and examine the binding to see if it is pressing unduly on the bark of the stock; if so, cut away the old tying material and rebind, but only moderately firm; cover with fresh clay as before, and put moss over the clay and keep it damp to prevent cracking.

YOUNG MAIDEN TREES raised at home, and growing in the open, should have stakes placed to them for the purpose of training the young growths, which are now being selected for forming the groundwork of the trees, in whatsoever style of training it is intended to follow. Espaliers should have three upright stakes, and a light bamboo cane fixed horizontally to these, in the proper position for the first tier of branches. Single cordons require one upright stake, double cordons two upright, and treble cordons three upright stakes, with a horizontal one tied to these from six to eight inches from the ground, on which to train the side shoots until they reach the upright stakes to which they are to be trained. Apples, pears, plums, and sweet cherries when grown either as espaliers or cordons, should have their branches trained at fifteen inches apart, while for gooseberries, red and white currants grown as cordons, twelve inches between the growths will be sufficient. Fan-trained trees require a light framework made on which to train them, fastening some young hazel twigs to this in the right direction for supporting the young leading growths. Young healthy trees invariably produce an abundance of growths, and in selecting these for forming the main branches always choose those that are growing in the desired direction; much bending of the branches to get them in position interferes with the proper flow of the sap.

TRAINING AND SUMMER PRUNING.—Continue to train in the young leading shoots on wall trees and others which may require it, and pinch back all lateral growths to five or six leaves, and the sub-laterals which may push out later to one leaf. Cut away entirely any gross shoot if it can be spared, and thin out the weakest and worst-placed among the clusters of young growths which so often put forth from the spurs. Keep all foliage clean by frequent syringings, and the borders in a moist condition by copious waterings whenever necessary. Pay particular attention to the thinning of the fruits, removing all surplus ones as early as possible to prevent any undue strain on the trees.—Geo. Woodgate, Rolleston H Gardens.

New Park for Merthyr.—The grounds of Cyfarthfa Castle, which have been purchased by the Merthyr Corporation, were, on the 5th inst., formally opened by the Mayor as a public park. The castle was built eighty years ago, at a cost of £30,000, by the late Mr. W. Crawshay, but during the past twenty years it has been unoccupied. The Corporation bought the castle and the 47 acres of land which formed the grounds for £18,000, and will convert the former into a secondary school.

GRAND YORKSHIRE FLORAL FETE AND GALA.

(Concluded from page 468.)

[illegible] They also scored for a single [illegible] with a similar design in orchids. [illegible] Messrs. Aldis and Rowntree came a good [illegible]. The best rose bouquet was of yellow [illegible], designed by Messrs. Aldis and Rowntree, who used a base of dark-hued rose [illegible]. Messrs. Perkins and Sons second, and Mr. C. E. Simpson third.

ROCK GARDEN CLASS.

A very attractive class is the one for a group of hardy herbaceous and perennial plants, with a background of decorative subjects,and with a pool of water and aquatic plants, all arranged for effect on a space not exceeding 30ft. by 10ft. There were five competitors, and consequently the class provided a fine feature. Premier place and [illegible] were won by Messrs. J. Backhouse and Son, Lim., York, for a very bold and pretty rock garden design backed by Japanese maples, roses, rhododendrons, and eremuri. An irregular pool of water at the foot of the bold rockwork contained irises, arums, and nymphæas, and was margined with hardy ferns and Primula japonica, while the low foreground of rockwork was occupied by dianthi, tiny alpine shrubs, primulas, saxifrages, and veronicas, with hardy [illegible] in the little bays. Saxifragas, ramondias, primulas, campanulas, and Adiantum pedatum were the leading plants used in the crevices of the bolder part of the rockwork. Second prize was secured by Messrs. W. Artindale and Son, Sheffield, who had a bold and pleasing design, the foreground, including the rustic bridge over the pool of nymphæas, and the groups of liliums, primulas, androsaces, and sedums and saxifrages being particularly good. Mr. S. Pickering, Rosslyn Street, Clifton, York, third; and Mr. J. Wood, Boston Spa, fourth.

HARDY FLOWERS.

The large collections of hardy flowers, cut, provided a grand feast of colour. The finest group arranged on a space 15ft. by 6ft. was from Messrs. Harkness and Son, Bedale, who set up grand bunches of oriental poppies, beautiful pyrethrums, Verbascum cala[illegible], V. pannosa, lupins, hemerocallis, campanulas, and splendid spikes of eremuri; Messrs. W. Artindale and Son, Sheffield, second; Messrs. G. Gibson and Co., Leeming Bar, third; and Mr. G. Cottam fourth.

For two dozen bunches of hardy flowers, Messrs. Harkness and Son, Bedale, secured the chief award, their finest bunches being Pyrethrum Carl Voot, P. Mrs. Cairns, Lupinus polyphyllus Rose Queen, Iris [illegible], oriental poppies, and Thalictrum aquilegifolium; Messrs. G. Gibson and Co., Leeming Bar, second; Mr. W. Hutchinson third; and Messrs. W. and J. Brown, Peterborough, fourth.

First prize for a dozen bunches of hardy flowers fell to Mr. G. Finlay, gardener to [illegible] Proud, East Layton Hall, Darlington, [illegible] the pyrethrums and poppies, lupins, tree peony Mdme. Van Houtte, and irises; Mr. A. R. Searle, gardener to the Marquis of Northampton, Castle Ashby, York, second; and Mr. Furniss, South Milford, third.

PLANT CLASSES.

Mr. J. W. Clarke had the best specimen [illegible]sia, a pyramid of Mrs. Marshall; Mr. W. Kettlewell second; and Mr. W. F. Crowther [illegible]. Dr. R. Appleton, The Bar House, [illegible], had the finest set of eight gloxinias, [illegible] specimens with grand blooms in [illegible]. Mr. Dobson, gardener to Sir J. [illegible] Lawson, Bart., Middlethorpe Lodge, [illegible] second, and Mr. W. Etley, gardener [illegible] the Rev. Canon Argles, St. Clement's Rectory, York, third

Specially fine were the four calceolarias shown by Mr. M. G. Jarvis, gardener to P. Stancliffe, Esq., Solberge, Northallerton, who was first prize-winner; Rev. Canon Argles second. Mr. Leadhill, gardener to Mrs. Akenhead, Acomb Park, York, was second for eight tuberous begonias, and Mr. F. Winn, Burton Stone Lane, York, was first, but there was little to choose between the competitors. Mr. G. Skill, gardener to S. Leetham, Esq., Elm Bank, York, led for eight calceolarias, and Rev. Canon Argles was second, both showing well.

ORCHIDS.

Premier award for a table of orchids, 12ft. by 8ft., arranged for effect, was won by Messrs. Cypher and Sons, Cheltenham, with an imposing display, wherein fine plants of Miltonia vexillaria, various lælio-cattleyas, and brasso-cattleyas, odontoglossums, Epidendrum prismatocarpum, Oncidium papilio, and Phalænopsis Rimestadiana were very pleasingly associated and arranged with ferns, palms, and moss.

The Messrs. Cypher led for ten orchids, their best specimens being Lælio-cattleya Canhamiana magnifica, Cattleya Warneri, Lælia grandis tenebrosa, Thunia Marshalliana, and Miltonia vexillaria. Mr. J. Barker, gardener to W. P. Burkinshaw, Esq., West Hill, Hessle, came second, with Miltonia vexillaria Hessle variety, M. v. H. E. Milner, Cattleya Mossiæ, etc.; Mr. W. Vause, Leamington, third.

For half a dozen orchids the Messrs. Cypher were again first, and here they had fine specimens of Cattleya gigas, C. Warneri, L.-c. Canhamianum, Thunia Marshalliæ, Lælia tenebrosa, and Miltonia vexillaria. Mr. J. Barker came second, and Mr. Vause third. Messrs. Cypher and Sons were placed first for three orchids, their best example being L.-c. Canhamiana with sixteen handsome blooms; Mr. J. Barker, second, and Mr. Vause third.

In the amateurs' classes for orchids Mr. Barker carried Mr. Burkinshaw's plants to first place in all three classes; and Mr. M. Furniss, Monk Fryston, South Milford, was also a successful competitor.

DESSERT TABLE.

There were three competitors in the class for a decorated table of ripe dessert fruit, not more than fourteen or less than ten dishes. First prize was won by Mr. James Gibson, gardener to the Duke of Portland, Welbeck Abbey, Notts, who scored a total of 113 points with magnificent Bigarreau de Schreken and Emperor Francis cherries (wonderfully fine), Bellegarde, and Crimson Galande peaches; Lady Sudeley apples, Lord Napier, and Early Rivers nectarines, Brown Turkey figs, Muscat of Alexandria, and Black Hamburgh grapes, Hero of Lockinge and Royal Jubilee melons, and Jefferson plums. The whole was decorated with Mdme. Abel Chatenay roses. Second prize fell to Mr. A. R. Searle, gardener to the Marquis of Northampton, Castle Ashby, who had fine Gunton Park strawberries and good Early Rivers cherries, and a decoration of odontoglossums and Cattleya Mendeli, and won 97½ points. Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, came third with 97 points.

VEGETABLES.

In Messrs. Sutton and Sons' class for a collection of six distinct kinds of vegetables the first prize was ably won by Mrs. Jas. Gibson, gardener to the Duke of Portland, Welbeck Abbey; Duke of Albany pea, Perfection tomato, Ideal potato, Canadian Wonder bean, Magnum Bonum cauliflower, and Favourite carrots were the varieties staged in excellent form. Mr. A. R. Searle, gardener to the Marquis of Northampton, took second award with another good lot, onions taking the place of beans; Mr. Wm. Nicholls, gardener to Lady Beaumont, third.

In a similar class provided by Messrs. E. Webb and Sons, Wordsley, Stourbridge, Mr. Searle gained premier honours with a collection, in which every dish was good. Second place was secured by Mr. W. N. Hague, gardener to W. D. Cliff, Esq., Meanwood Towers, Leeds, while Mr. Robert Dobson, Marton, Sinnington, was third. Messrs. Dickson and Robinson's class for two bunches of tomato Moneymaker, brought out some large bunches, many of the fruits, however, being far from ripe; first prize was awarded to Mr. Wm. Folkes, Ampthill, Beds; second to Mr. J. Brennand, Baldersby Park, Thirsk; third to Mr. A. R. Searle; and fourth to Mr. W. N. Hague.

In the society's class for twelve tomatoes Mr. G. F. Brotherston, gardener to F. Samuelson, Esq., Breckenbrough Hall, Thirsk, was first. Mr. N. Sargent, gardener to Lady Payne-Gallwey, Thirkleby Park, Thirsk, was second; and Mr. F. Dean, Rose Cottage, Clifton, York, third.

In Messrs. Backhouse and Son's class for vegetables Mr. Searle led wih a fine set of ten kinds; Mr. W. Nicholls second, and Mr. W. N. Hague third.

FRUIT.

For a dish of strawberries Mr. Brotherston scored with Royal Sovereign; Mr. C. Lawton, gardener to Colonel Harrison-Broadley, Welton House, Welton, E. York, second. Cherries brought only two entries, the awards being given to Mr. J. Gibson, and Mr. B. Ashton, gardener to the Earl of Lathom, Ormskirk, who received first and second prizes respectively. For a dish of figs Mr. A. R. Searle was first, and Mr. J. Gibson second. For a white-fleshed melon Mr. T. Pattison, gardener to W. C. Gray, Esq., Tunstall Manor, West Hartlepool, was first; and for a green-fleshed melon Mr. W. N. Hague led; while Mr. J. H. Goodacre led for a scarlet-fleshed melon, with Mr. J. Gibson second.

Mr. J. Tullett, gardener to Lord Barnard, Raby Castle, Staindrop, scored for six nectarines, with Mr. A. R. Searle, second. In a similar class for peaches Mr. G. E. Thomas won first place, and Mr. C. Lawton second.

For a collection of four kinds of fruit Mr. J. E. Hathaway led with black grapes, peaches, nectarines, and a melon; Mr. J. C. McPherson, gardener to Baron de Forest, Londesborough Park, second; and Mr. John Turton, gardener to R. J. Foster, Esq., Stockfield Park, Wetherby, third. For a collection of six dishes of fruit, including not more than two sorts of grapes, the first place was secured by Mr. Hathaway, second by Mr. J. C. McPherson, and third by Mr. William Nicholls.

For ten dishes of fruit, in as many kinds, Mr. J. C. McPherson led with a good collection, including a Queen pine, Black Hamburgh and Muscat of Alexandria grapes, Royal George peach, Brown Turkey figs, Royal Sovereign strawberry, Barnack Beauty apple, a seedling melon, Early Rivers' cherry, and Cardinal nectarine. Mr. J. H. Goodacre followed with good peaches, Czar plums, and other choice fruits.

Mr. H. Bray, gardener to Lady Hawke, Wighill Park, Tadcaster, led for two bunches of Black Hamburgh grapes, with excellent bunches; Mr. William Nicholls was second; and Mr. G. Bush, gardener to J. A. Dunkerley, Esq., St. Mary's Terrace, Beverley, third. For two bunches of white grapes first prize was secured by Mr. W. Jackson, gardener to Lord Hotham, Dalton Hall, Beverley, with good bunches of Buckland Sweetwater; Mr. J. Brennand second, and Mr. W. Nicholls third with the same variety; six entries.

NON-COMPETITIVE.

The non-competitive displays were a magnificent feature of the show.

Perpetual carnations were beautifully shown by Mr. C. F. Waters, Balcombe, Sussex; he avoided overcrowding, and set up fine vases of Britannia, Yellow Gal, Rose-Pink Enchantress, Edith Waters (a grand new salmon-red seedling), White Perfection, Victory, Cecilia, and Mrs. H. Burnett. A delightful and fragrant display of sweet peas from Mr. C. W. Breadmore, Winchester, contained fine blooms of Audrey Crier, George Herbert, Lavender George Herbert, Helen Lewis, Mrs. A. Ireland, St. George, Mrs. C. W. Breadmore, Henry Eckford, Mrs. Henry Bell, etc.

Mr. F. Lilley, Guernsey, contributed a selection of finely-grown gladioli of the Colvillei section, and a collection of Spanish and Kæmpferi irises. Mr. E. J. Hicks, Twyford, Berks, displayed a nice lot of roses, showing garden varieties extensively. Messrs.

T. Rivers and Sons, Sawbridgeworth, Herts, set up one of their very fine and instructive displays of choice fruits grown in pots. The seedling peaches and nectarines were a fine feature, and the crops of ripe fruits on Early Rivers, Darwin, Humboldt, and Cardinal nectarines, and Crimson Galande, Dagmar, Early Alfred, Thomas Rivers, and Merlin peaches, Blue Rock, the Czar, and Early Prolific plums, May Duke, Belle d'Orleans, and Ohio Beauty cherries, and several varieties of Frontignan grapes, caused many mouths to water.

The very bright exhibit set up by Messrs. Sutton and Sons, Reading, consisted of well-grown fruits and vegetables, the firm's specialities, prettily associated with Sutton's Queen and other sweet peas, Nigella Miss Jekyll, miniature calceolarias, clarkias, schizanthuses, and lupins. The melons and tomatoes were excellent, so also were First Crop cauliflowers, Dwarf Defiance and Superlative peas.

A bold but rather crowded group was arranged by Messrs. James Backhouse and Son, Lim., York; here were Dorothy Perkins roses, groups of pink spiræas and liliums, a selection of perpetual carnations, fine hydrangeas, caladiums, dracænas, etc., and an edging of the newer plumose nephrolepises. Some very beautiful floral designs were shown by the York firm, and the butterfly made of brilliant golden and bronze violas and pansies, and the carnation bouquet were specially noteworthy.

Messrs. W. Cutbush and Son, Highgate, London, had a very big display of carnations, both perpetual and Malmaison varieties, their new Lady Coventry Malmaison variety attracting a great deal of attention. The pink spiræas, Queen Alexandra marguerites, the handsome Coleus Cordelia, and a grand lot of eremurus spikes set amid Oriental poppies and veronicas, were excellent.

Messrs. Webb and Sons, Wordsley, were responsible for a large exhibit, in which their fine strain of gloxinias, together with a selection of sweet peas, served as a charming setting for the firm's specialities in melons and various vegetables. The melons were conspicuously good, notably the fruits of Masterpiece, Queen Victoria, Centennial, Diamond Jubilee, Royal Sovereign, New Epicure, and Hero of Lockinge. The forcing turnips, Everbearing cucumbers, Triumph and Favourite radishes, and Sensation and Jubilee tomatoes, were other great attractions. The whole made up a very effective exhibit. Messrs. W. and J. Brown, Peterborough, made up a large group of cut roses, heliotropes, verbenas, aquilegias, standard fuchsias, the gay Lady Rolleston gaillardias, and eremuri. Mr. Thos. W. Darlington, Carnforth, showed a selection of the finer and newer sweet peas. The new Primula Bulleyana, a hardy Chinese species, was again well shown by Messrs. Bees, Lim., Liverpool. Zonal pelargoniums, sweet peas, carnations, and irises, were displayed in quantity by Messrs. Jarman and Co., Chard.

Messrs. Clibrans, Altrincham, put up a bank of their new Calceolaria Clibrani, which demonstrated the decorative value of this clear yellow, floriferous plant. A goodly group of the newer nephrolepises was staged by Messrs. E. J. Batchelor and Sons, Harrogate, and in it we noticed a new variety of much interest, named N. superbissima. Messrs. John Forbes, Lim., Hawick, N.B., put up an attractive display of their ever-popular phloxes, pentstemons, and violas. Among the phloxes the Duke of Marlborough was particularly fine. The pentstemons included Parachute, Mrs. Cook, Crimson Gem, and Marquis of Linlithgow, all new varieties of first-class quality. A few very fine antirrhinums in quite new shades of colour added to the attractions of this interesting exhibit. Mr. W. Edwards, sen., Daybrook, Notts, showed his well-known table decorations, a new device in the form of an arch being worthy of special mention. Messrs. Robert Sydenham, Lim., Birmingham, showed sweet peas, in select and pleasing varieties, and the blooms were good for the early date.

A large epergne of Mr. C. H. Herbert's new perpetual-flowering Pink Progress served once more to demonstrate the real merits of this remarkably fine plant, introduced from the Nurseries, Acock's Green, Birmingham. Ferns in great variety were well staged by Mr. H. N. Ellison, West Bromwich. Messrs. Dobbie and Co., Rothesay, filled a long table with a grand and comprehensive exhibit of pelargoniums, pansies, violas, and aquilegias, the best known and newer varieties of each class being represented by perfect blooms, all showing skilful cultivation. The colours in the aquilegias were certainly remarkable for their variety of tints and pleasing shades. Miss Hemus, Holdfast Hall, Upton-on-Severn, made an attractive display of sweet peas, and the size and quality of the blooms betokened good culture; one of the most pleasing varieties was the renowned Evelyn Hemus. Kelway's pæonies and pyrethrums made a fine glow of colour, and fully maintained the reputation of the Langport specialists. The pæonies included both double and single varieties, ranging in colour from pure white to deepest crimson, with delicate flesh-pinks and lovely rose shades in between. The single pyrethrum General French was very attractive, its golden disc showing up to advantage against the rich crimson petals. A very bold exhibit of hardy flowers was staged by Messrs. R. H. Bath, Lim., Wisbech, oriental poppies, pyrethrums, and pæonies being as good as could be wished. Perpetual-flowering carnations were well arranged at one end of this firm's stand.

A very large exhibit of high merit was that put up by Messrs. Wm. Artindale and Son, Sheffield; there were about 100 varieties of violas, arranged in fan-shaped bunches, in which the individual blooms were shown to advantage; Addie Elsden, Kathleen, and Marjorie Barber are new varieties of considerable promise, and the firm's novelty of last year, Ernest Needham, was also well shown. Perpetual-flowering carnations occupied a part of the firm's stand, and included the best varieties. Messrs. Dicksons', Lim., Chester, set up irises, delphiniums, pyrethrums, and a variety of useful and interesting perennials.

Mr. G. Yeld, M.A., Burton Lane, York, exhibited an exquisitely beautiful series of his hybrid and crossbred irises, among them being some really lovely things. A grand vase of Lord of June showed this large handsome iris in fine form. Sunshine is a particularly clear yellow, while Purity is as nearly pure white as can be. A few richly-coloured hybrid hemerocallis were also staged, and included Tangerine, a rich orange-yellow, Apricot, and Flame. Messrs. Moore, Lim., Rawdon, Leeds, occupied one end of the orchid table with an interesting group, comprising good odontoglossums, cattleyas, Miltonias, etc.

Messrs. Laxton Bros., Bedford, staged baskets of fine Bedford Champion and Royal Sovereign strawberries, and also some well-grown peaches. A small group of orchids was staged by Mr. J. E. Sadler, Newbury, Berks.

The extensive group of ornamental trees and shrubs, arranged outside the tents by Messrs. J. Backhouse and Son, Lim., York, contained much of interest. Roses were finely staged in the tent by Mr. George Prince, Longworth, Berks, the singles, polyantha, and other garden roses being shown in bunches, and, with hybrid teas, combined to make a very fine display.

MEDALS.

Gold.—Four gold medals were offered for the best trade displays, but only two of these were awarded, viz., to Messrs. J. Backhouse and Son, Lim., York, for ornamental trees and shrubs, and to Messrs. W. Cutbush and Son, Highgate, for a collection of plants and flowers. The Dean of York's special prize and a gold medal were awarded to Messrs. T. Rivers and Sons, for fruit trees in pots. A gold medal was awarded to Messrs. Sutton and Sons, Reading, for vegetables and fruits, and one to Messrs. Webb and Sons, Wordsley, for vegetables, fruits, and flowers.

Silver.—To Messrs. Moore, Lim., Rawdon, Leeds, for orchids; and to Mr. C. F. Waters, Balcombe, for carnations.

BATH GRAND ROSE SHOW and
GENERAL SUMMER EXHIBITION.
SYDNEY GARDENS,
WEDNESDAY and THURSDAY, July 7 and 8.

Classes for Roses, Nurserymen and Amateurs.
Bouquets, Cut Flowers, Sweet Peas, Strawberries,
Plants, and Tuberous Begonias.
Entries close July 2nd.

For prize schedules, etc., apply,
B. R. F. PEARSON, Sec.
Office, 17, Argyle Street, Bath.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY COMING OF AGE SHOW.
SOPHIA GARDENS, CARDIFF,
WEDNESDAY and THURSDAY, July 21st and 22nd,
1909.
Most liberal prizes for this show.
MONEY, PLATE, etc., Amounting to about £400.
Many special features this year.
Schedules free to any address.
Mr. A. MAURICE BAILEY, Secretary.
24, Duke Street, Cardiff.

HANLEY PARK, STAFFORDSHIRE
July 7th and 8th, 1909.

THIRTEENTH GREAT
ANNUAL FLORAL FETE.
£650 in Prizes. Silver Cups, Gold and Silver Medals.

SILVER CHALLENGE CUP, VALUE £10 10s.
offered for TRADE EXHIBIT (for particulars, see page 10 in Schedule).

Valuable Special Prizes offered by the principal firms in England.

The Railway Companies will convey Exhibits at one fare for the double journey, provided they remain the property of the Exhibitors.

Schedules post free on application to—
WM. POULSON, Secretary.
Town Hall, Hanley.

RICHMOND HORTICULTURAL SOCIETY.
THE THIRTY-FIFTH GRAND ANNUAL SHOW
will be held in
THE OLD DEER PARK, RICHMOND,
On WEDNESDAY, 30th June.
Valuable Money Prizes. Silver Challenge Cups for Roses and Fruit.
Entries close 23rd June.
W. J. COOK, Hon Sec.
Holmsley House, Richmond, Surrey.

SHREWSBURY GREAT FLORAL FETE,
AUGUST 18 and 19, 1909.

OVER £1,100 IN CASH PRIZES.

Schedules for this year are now ready, and may be had post free from—
Messrs. ADNITT and NAUNTON, Hon. Secs.,
Shrewsbury.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Counties Agricultural Show.

It was an extensive and well-attended show which was held at Reading on June 8 and three succeeding days, and although essentially a farmer's, stock-breeder's, and dairyman's exhibition, there was much of interest to the gardener, both in the way of excellent produce and up-to-date and useful implements and appliances. The seedsmen's stands alone were well worth a visit.

As was to be expected, Messrs. Sutton and Sons made a great effort to uphold the reputation of their town as a notable centre of the seed business of this country, and most successsfully did they accomplish their purpose. Their stately pavilion was a great feature of the show, and the incessant stream of visitors passing through was evidence of the fact that gardeners and farmers alike found in this comprehensive exhibit much of interest and educational value. Outside the pavilion were beds and borders gay with the firm's strains of petunias, stocks, [illegible] sias, Cineraria stellata, etc.

Rambler roses in full bloom furnished the pillars of the verandah, and between the flower beds were fine turves grown from Sutton's various combinations of the best lawn grass seeds. Across one end of the pavilion was a bed which demonstrated in capital fashion the much-discussed French gardening, and an inspection of the triple crop of lettuce, carrots, and radishes, growing both under cloches and in litter frames, could not fail to impress upon one the fact that whatever the possibilities from a commercial standpoint, this system is most excellent for the private gardener who has to supply a large table from a limited growing area. The type and strains of seeds used by Messrs. Sutton are all that can be desired. They are compact and quick growing, and in the case of both carrots and radishes carry extremely small tops. Inside the pavilion were displayed in large quantities and great variety peas, beans, carrots, potatoes, tomatoes, and in fact all classes of vegetables and salads of the highest quality, and at so early a date it is safe to say such an exhibit has rarely, if ever, before been seen. Another stand of great excellence was that of Messrs. E. Webb and Sons, Wordsley, Stourbridge. Here the firm's specialities in farm seeds preponderated, but the stand was made gay and attractive by splendid gloxinias, calceolarias, sweet peas, cinerarias, etc., and some capital melons, tomatoes, and vegetables were also on view. Messrs. Toogood and Sons, Southampton, decked the front of their stand with Spanish irises, Gladiolus Colvillei, a beautiful strain of salpiglossis, and some good petunias. There were also excellent cabbages and other vegetables on the stand. Messrs. J. K. King and Sons, Coggeshall and Reading, displayed a large collection of excellent vegetables, among which we specially noticed potato St. Paul's, a fine oval, thin-skinned tuber of first-rate appearance. The firm's lawn grasses were presented in capital style, and the label, stating that they were of the same stocks as supplied to the Royal parks for several years, was of interest. Samples of manures and chemical fertilisers were well displayed by the Chemical Union Lim., Ipswich, and many excellent machines, tools, and patent appliances of merit were exhibited, but which space forbids us to describe.

Birmingham Botanical and Horticultural Society.

The first summer exhibition of orchids and early summer flowers was held in the Edgbaston Gardens, under the most favourable auspices as regards splendour of the show, the attendance of visitors, and the weather. The orchids were especially noteworthy, and the attractions of the fete were further enhanced by the magnificent floral picture presented by the rhododendrons and azaleas in the American Garden. The rock garden, now in its glory, received a full share of attention from the visitors.

Half a dozen collections of orchids were staged for honorary awards, and the society's gold medal was awarded to Wm. Waters Butler, Esq., Southfield, Edgbaston. The collection occupied a staging 30ft. by 6ft. It was regarded as the finest collection ever shown at the Botanical Gardens, and containing as it did several kinds and varieties of great rarity, it attracted much attention, and the artistic arrangement reflected much credit upon Mr. T. H. Jones (Mr. Butler's head gardener). The group was effectively edged by a row of excellently-developed plants of Lilium longiflorum. A few of the more noteworthy kinds were Cattleya Vulcan, C. Lawrenceanum, C. intermedia alba (very fine), C. [illegible] (fine), C. Mrs. R. A. H. [illegible], Lælia purpurata alba, L. purpurata [illegible], Cattleya Sir F. Wigan, C. Mossiæ [illegible], C. M. alba Glorie de la France, C. M. Waterloo, C. Mendeli, C. M. White Lady, C. M. Her Majesty, C. M. Mrs. F. Wellesley, C. M. Westfield Beauty, Lælio-cattleya [illegible], L.-c. Henry Newey, L.-c. Lady [illegible] and L.-c. Macfarlanei; Odontoglossum crispum Queen Maud. O. Pescatorei alba (Southfield variety), O. ardentissimum Sanderæ, O. Brilliantissimum, O. Empress of India, O. Raymond Crawshay, O. Harryanum crispum var. Grande, O. crispum Janette, O. c. Muriel, O. c. Crissy, O. c. Norman, O. c. Rossendale, O. c. album, O. c. Lucyanæ, and O. c. Persimmon.

A silver-gilt medal was awarded to the Right Hon. Joseph Chamberlain for his splendid bank of orchids, consisting chiefly of masses of Miltonia vexillaria, cattleyas, and Lælio-cattleyas in profuse variety, Odontoglossum crispum, Phalænopsis Rimestadiana, Cochlioda Noetzlianum, and Anguloa Clowesi. The collection was especially attractive, and reflected much credit upon the artistic ability of Mr. Mackay, the Highbury orchidist. A silver medal was deservedly awarded to Messrs. Moore, Lim., Rawdon, Leeds, for a beautiful collection, consisting chiefly of Cattleya Mossiæ in variety, Lælio-cattleya Fascinator, L.-c. endora magnifica (an Award of Merit), and L.-c. Aphrodite alba. Among the odontoglossums O. Roliæ was conspicuous, and Gongora Wilsoni, Epidendrum Wallisi, cypripediums, Miltonia vexillaria, and Cirrhopetalum Colletti were well represented, and mention must be made of Cattleya Dusseldorfi Undine. The Lord Mayor of Birmingham (Alderman G. H. Kenrick) was represented by a comparatively small collection of choice orchids, and a bronze medal was awarded. A bronze medal was allocated to Richard Fenwick, Esq., Edgbaston, for a select and tasteful arrangement of orchids. A silver-gilt medal was awarded Messrs. Gunn and Sons, Olton, for a superb group, comprising decorative climbing roses in pots, a very attractive bowl of sweet peas, gladioli, pyrethrums, and other miscellaneous border flowers, and a fine display of their charming Viola cornuta purpurea. Messrs. Robert Sydenham, Lim., staged a dainty lot of Spanish iris, for which a bronze medal was awarded. A silver medal was awarded to Messrs. Bakers, Wolverhampton, for a large collection, comprising Oriental poppies, aquilegias, pyrethrums, lupins, irises, delphiniums, etc. Messrs. Jarman and Co., Chard, were awarded a bronze medal for an attractive display of sweet peas, centaureas, zonal pelargoniums, and aquilegias. To Mr. C. H. Herbert, Acock's Green, the award of a bronze medal was made for an attractive display of his new pink Progress, a nice strain of aquilegias, and of violas. A bronze medal was awarded Mr. R. H. Ellison, West Bromwich, for a fine collection of ferns; a similar honour fell to Mr. James Simpson, Harborne, for a collection of ornamental shrubs. Mr. Richard Peyton, Edgbaston, received a bronze medal for a good collection of gloxinias, caladiums, hydrangeas, etc. Votes of thanks were given to Mr. James Webb, gardener to W. Byng Kenrick, Esq., for a group of pelargonium Achievement (a cross between a pink ivy-leaf and a zonal pelargonium), and to Messrs. Bick Bros., Olton, for a collection of violas.

In the competitive classes prizes were offered for orchids, stove and greenhouse plants in flower, and cut tree carnations in vases. Strangely, however, they were all conspicuous by their absence. The competition for the prizes for violas was small, and the quality comparatively poor. For twelve varieties in vases Mr. J. Delbridge, Penkridge, Staffs, was placed second, and Mr. J. Webbs third. For six vases Mr. Webbs was first, and Mr. Delbridge third.

The arrangements of the show were admirably made by a committee, of which Mr. Neville Chamberlain was chairman, and Mr. T. Humphreys the hon. secretary.

East Anglian Horticultural Club.

There was a good attendance of members at the June meeting of this club. Mr. W. Palmer, gardener to I. B. Ceaks, Esq., Thorpe, gave a paper upon "Lily Culture." Mr. Palmer has a high local reputation as a cultivator of liliums, consequently his remarks were listened to with interest. Soils, sizes of pots, as compared with sizes of bulbs, and subsequent treatment were all treated in a practical manner. He strongly advocated planting some bulbs in the open with such peat-loving subjects as rhododendrons and azaleas. The paper brought out a capital discussion. The tables were well filled with exhibits of a varied character, which added to the pleasure of the meeting. The summer outing was fixed for July 18 to Earsham Hall, the seat of Captain J. P. Meade.

United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the Horticultural Hall, Vincent Square, Westminster, on Monday evening, June 14, Mr. Charles H. Curtis in the chair. Seven new members were elected, making a total of 34 for the six months of this year. The Secretary reported that sickness among the members had been somewhat lighter, £37 4s. having been paid since the last meeting, against £65 7s. for the previous month. Several amounts of interest were paid to members over 60 years of age.

TRADE NOTE.

It will be seen from the announcement in our advertisement pages that the partnership existing between Mr. Stuart H. Low and Mr. Edward V. Low, who carried on the business of nurserymen and orchid growers at Bush Hill Park, under the style of Hugh Low and Co., has been dissolved. In our issue of last week it was announced that Mr. Stuart H. Low would in future carry on business at Bush Hill Park under the style of Stuart H. Low and Co. We now learn that Mr. Edward V. Low has taken over the stock of choice and valuable orchids of the late firm, and has removed same to the Orchid Nursery, Vale Bridge, Haywards Heath, lately vacated by Messrs. Charlesworth and Co., which he has purchased. Mr. Edward V. Low was from about 1882 exclusively connected with the orchid department of the late firm of Hugh Low and Co., which was under his personal control and management, and we understand that in future he will specialise in the cultivation of the choicer and more valuable orchids at Vale Bridge, where we hope he will have every success.

ANSWERS TO CORRESPONDENTS.

ALGÆ ON LAWNS.—C. S., Luton: The growth that is spoiling the terrace lawn is an algæ, closely related to the seaweeds, and it can only thrive in moist situations. It is evident that the site needs to be drained, and probably the soil should be made lighter. At present your best plan will be to give the lawn a good dressing of air-slaked lime, as this will improve the grass and tend to eradicate the algæ. If this dressing does not materially improve matters, write us again, and give particulars of soil and situation, so that we may be the better able to advise you.

PEAR GNAT MIDGE.—H. W., Shotley Bridge: Many years ago Mr. W. Crump drew attention in these columns to the destruction caused in the West of England by the pear gnat midge, and to the probable distribution of the pest. In some seasons the damage done does not appear to have been great, while in others the crops have suffered greatly and in places wide apart. As far back as 1899 we published an account of the life history of the pest, by Mr. F. Martin Duncan, with illustrations, and in our issue of June 18, 1904, we again drew special attention to the ravages of the midge, and the means to be taken to stamp out the enemy. The pear midge (Diplosis pyrivora) is a tiny winged insect with a strong ovipositor, by means of which it pierces unopened pear blossoms, and deposits the eggs inside, on, or among the stamens. Sometimes the insect pierces the calyx and deposits the eggs in the embryo fruit. Egg deposition takes place in early April, or a little later or earlier, according to the season. The tiny grubs work towards the centre of the fruit directly they hatch out, and they soon consume all that is to them edible inside. During the first half of June the grubs prepare to leave their quarters, and if the infested fruits do not fall to the ground, the grubs eat their way out and drop, bury themselves an inch deep in the soil, and form their cocoons. The insect winters in the soil in the chrysalis state, the perfect, winged insect emerging in spring in time for an attack upon the swelling pear blossom buds. All the fruits that fall from infested trees should be gathered up and burned day by day, and the ground around the trees should be dressed with kainit at the rate of 4oz. or 5oz. per square yard, as this kills any larvæ it comes into contact with, and helps the trees. Take every possible care to secure and burn all infested fruits, as this is the best means of checking the ravages of the midge. In late autumn, after leaf-fall, and after giving the trees a winter dressing, remove and burn the surface soil under and around the trees to a depth of two inches, and in its place give a good dressing of soil and old manure. Both muriate of potash and nitrate of soda have been recommended as dressings at this season of the year, but it has been proved that kainit is more effective than these.

SWEET PEAS. — J. L. W., Faversham: There are several sweet peas of somewhat similar colour to those you have sent us, and the unfortunate point about many of them is that they fade so badly under extremes of wet or heat. It is rather early yet to properly identify sweet peas, and the opportunities for making comparisons are at present very few. If you do not identify the variety by the end of the month send us a few blooms early in July, and we will endeavour to solve the mystery. We presume that you are quite sure neither seeds nor plants were mixed by yourself. It is a very easy matter to mix varieties in the seedling stage when dealing with a considerable number.

RUST ON TOMATO LEAVES.—A. W. G., Cardiff: The plants are evidently suffering from a very bad attack of tomato leaf rust (Cladosporium fulvum), a disease that is fairly common on plants grown under glass. We cannot advise you fully, as you do not say how far the disease has taken possession of the crop, but if the majority of the plants have their leaves as badly infected as the small specimens sent, then the crop is in a very bad way. More artificial heat and increased ventilation, so as to secure a drier, buoyant atmosphere throughout the house will have a beneficial effect. Spray with a weak solution of sulphide of potassium (1oz. of sulphide of potassium to 2½ gallons of water) every ten days or so, taking care to spray both sides of the leaves. Plants very badly diseased should be removed and burned.

VERONICA HULKEANA.—C. L., Bath: This is by no means a new plant. We figured it five years ago, when Messrs. J. Veitch and Sons exhibited it so well; but it gained a First Class Certificate from the Royal Horticultural Society in 1882, when shown by Mr. James Douglas, who was then at Loxford Hall. The plant should be propagated from occasionally, as it has a way of dying off suddenly when it attains some size and has flowered very freely. It is a most distinct and elegant species, and we are glad you have been so successful with it.

VALLOTAS. — M. E. G., Whitby: Give the specimens a rich top-dressing, composed of equal parts of decayed cow manure and fibrous loam, first removing all inert surface soil. After top-dressing, give the plants a position in a cold frame and stand the pots on a good bed of ashes.

NAMES OF PLANTS.

W. J. C., Minehead.—Insufficient for identification.

S. A., Woking.—1, Cotoneaster buxifolia; 2, C. horizontalis.

F. C. J., Chelmsford.—1, Weigela Abel Carriere; 2, Quercus diversifolia; 3, Vitis Henryi; 4, Lupinus polyphyllus.

L. A. G., Exeter.—1, Phlox pilosa; 2, Dictamnus fraxinella alba; 3, Anthericum liliastrum; 4, Hemerocallis flava.

M. D., Holyhead.—1, Leycesteria formosa; 2, Maxillaria Sanderiana; 3, Oncidium pubes; 4, Cattleya Mendeli, a good variety.

FORTHCOMING ENGAGEMENTS.

TUESDAY, June 22.—Royal Horticultural Society, Committees meet at 12 o'clock; at 3 p.m. the First Masters' Memorial Lecture on "Masters' Vegetable Teratology," by Prof. Hugo de Vries: Scientific Committee at 4 o'clock.

Situations Wanted.

HER GRACE THE DUCHESS OF DEVONSHIRE wishes to recommend J. THOMPSON to any Lady or Gentleman requiring the services of a HEAD GARDENER, where several are kept; 20 years' experience in all branches. Holker Gardens, Cark-in-Cartmel, Lancs.

LADY MALCOLM, of Poltalloch, highly recommends her HEAD GARDENER; eight years in present place, Head of three; life experience in all branches; age 36; married, one child, seven years. W. BASTIN, Barnardiston Hall Gardens, Haverhill, Suffolk.

MISS DALTON highly recommends GARDENER (Head Working, or good Single-Handed); life experience. 10 years' excellent character, leaving through death; age 34; married, one child, aged 8 years. Apply W. HIGGINS, The Lodge, Darrington, Camberley, Surrey.

GARDENER (Head) seeks SITUATION where three or more are kept; age 30; married, two children; six years Escrick Park, five years Campsall Hall; three years as Head at present situation. SKILBECK, Nunthorpe Hall, York.

GARDENER (Head) Scotch, wishes SITUATION where three or more are kept; experienced in all branches; married; age 36. JOHN McINTOSH, Calder Park, Baillieston, Lanarkshire, N.B.

GARDENER (Head, where two or three are kept); life experience; good references; can be highly recommended from present situation; age 29, married, no family; in or near Reading preferred. H. MARSHALL, Manor House Gardens, Cookham Dean, Berks.

GARDENER (Head Working, where two or three are kept).—Mr. SEDEN, West Grinstead Park, Horsham, can highly recommend his Foreman, J. BARRETT, to any lady or gentleman in want of a practical man; age 28.

GARDENER (Head Working), good, practical life experience in all branches, Inside and Out; early and late forcing; especially good with melons, violets, and chrysanthemums; 9 years with last employer as Head; can have excellent references. H. TURNER, 4, Glenton Street, Peterborough.

GARDENER (Head Working), thoroughly experienced Under Glass and Outside; also herbaceous plants; excellent character from present and previous employers; married, no children. J. L., 20, Carnarvon Road, Barnet.

GARDENER (Head Working), where more are kept; 25 years' practical experience in all branches, Inside and Out, early and late Forcing, Vines, Cucumbers, Melons, Stove, and Greenhouse Plants, Herbaceous Borders; thoroughly reliable; highly recommended; married, without encumbrance. WOODHOUSE, Eastwood Road, Bramley, Surrey.

GARDENER (Head Working).—A Gentleman would be pleased to recommend a thoroughly reliable, steady Man where several are kept; can grow the new indoor Carnations; 10 years' first-class character from last place; Land and Stock if required; abstainer; married. H. PITTMAN, Twyford, Winchester.

GARDENER (Head Working); thoroughly experienced in all branches; good Carnation Grower and Decorator; good manager; excellent testimonials and very highly recommended; would be pleased to communicate with Lady or Gentleman requiring competent, trustworthy Man; disengaged. J. NORWOOD, Norman Street Farm, Ide Hill, Sevenoaks.

GARDENER (Head Working), where one or two are kept; practical experience, Inside and Out; nineteen years present situation; good references; age 40; married when suited. S. COVENTRY, Reading Road, Pangbourne, Berks.

GARDENER (Head Working); Scottish, would like a Situation in South England; experienced in all branches; age 40. J. F., care of Braid, 4, Albany Street, Leith, Scotland.

GARDENER (Head Working or good Single-handed, with help); life experience Inside and Out; good references; middle age; single. G. BURGESS, 17, Eversleigh Road, Lavender Hill, London, S.W.

MESSRS. LADHAMS, Nurserymen, Shirley, Southampton, can confidently recommend W. GUNSTON, age 35, as HEAD WORKING GARDENER to any lady or gentleman requiring the services of a good all-round man, who is conversant with the requirements of a well-kept establishment; excellent references. Apply as above.

MR. NEWBERRY (Head Gardener to the Earl of Verulum, Gorhambury, St. Albans) will with confidence recommend his late Foreman as Head of three or four; age 32; abstainer; 16 years' good general experience; disengaged; 4 years' reference. T BUTT, Home Cottages, School Road, Whyteleafe, Surrey.

MRS. GRAHAM MOON wishes to recommend her Gardener, who has been with her five years, as HEAD where two are kept, or good SINGLE-HANDED; age 32; married, no children; leaving through death. A. JOLLIFFE, Cedar Lodge, Taplow, Bucks.

GARDENER (Head or Single-handed, with help), age 35; married; life experience Inside and Out; good reference from present and previous employers. J. NICHOLLS, 54, Loder Road, Preston Park, Brighton.

GARDENER seeks SITUATION as good single-handed or where help is given; 2½ years' good character; married when suited. P. MUSTOW, Coln St. Aldwyns, Fairford, Glos.

GARDENER (Single-handed or with help); good Second's place not objected to; married; age 36; tall; one child; life experience, Inside and Out; good references. H. WARNER, 17, Salmestone Road, Margate, Kent.

GARDENER, age 25, seeks SITUATION, single-handed or otherwise; 11 years' experience, Inside and Out; good references. A. RANDALL, 40, Victoria Place, East Street, Epsom.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WEED KILLER used once a year "No weeds can live." RICHARDS' ARSENATE OF LEAD for all leaf-eating insects. CUCASA (fungicide), the finest preparation of copper ever offered to gardeners. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

IMPORTANT TO GARDENERS AND FRUIT GROWERS

"NIQUAS"
INSECTICIDE
CORRY & CO. LTD
LONDON

'NIQUAS'

(REGISTERED).

The most successful Non-poisonous Insecticide of the day.

ITS ADVANTAGES ARE—

Certain Death to all Insect Pests.

No possible injury to the most delicate Plant, Flower, or Foliage.

It is by far the Cheapest Insecticide known. One pint makes 10 to 12 gallons for Thrip, Black and Green Fly, etc., whilst RED SPIDER, Mealy Bug, and Scale can be thoroughly eradicated by using "NIQUAS" about double the strength required for Fly.

It is most successfully used by Orange and other Fruit Growers in the Colonies, etc.

PRICES:—Pint, 1/-; Quart, 1/9; ½-Gal., 3/-; Gal., 5/-; Kegs, each, 5 gals., 22/6; 10 gals., 42/6.

Ask for Testimonials, of which some hundreds have been received.

Specimen Testimonial

From Mr. E. HUBBARD, Gardener to G. Hanbury Esq., Blythewood, Burnham, Bucks, May 15th, 1906.

"I have been using your '**NIQUAS**' **Insecticide** for some years, and can with all confidence say it is the best I have ever used for Bug, Thrip, Red Spider, American Blight, and for all Insect Pests it has no equal. Also for the destruction of Maggots in Marguerites by dipping. I have recommended it to my friends generally."

TO BE HAD FROM ALL SEEDSMEN AND FLORISTS.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

National Vegetable Society.

The formation of a society that shall be wholly devoted to vegetables and vegetable culture is a matter of much interest, as conclusively showing that the utilitarian aspect of the garden is now receiving the attention its importance demands. Time was, and that not so far distant, when the cultivation of vegetables was generally regarded as a duty rather than as a pleasure. They were, as a matter of course, grown in sufficient quantities to meet the requirement of the household, and with a considerable amount of success; but the same interest was not shown in the quarters of the kitchen garden as in the cultivation of the various classes of stove and greenhouse plants, in fruit production under glass, or, indeed, in the management of the trees of choice fruits given the shelter of walls. Indeed, some of the older members of the gardening profession tell us of a time when there was a difficulty in inducing young men who were being trained as gardeners to devote a sufficient proportion of their time to the details of kitchen garden management, owing to their preference for glass culture. This is not altogether surprising, considering how great was the interest associated with the continuous flow of tender exotics into the garden, and the great credit that the production of good crops of grapes or peaches, or finely-developed pineapples brought the grower. Happily, there is now a change in the trend of opinion on the relative importance of the several departments of the garden, and young men who intend becoming gardeners turn readily to the study of vegetables and of the methods by which they can be grown to the highest degree of perfection. As the result of this highly beneficial change vegetables are more largely and more successfully grown in private gardens, and market supplies have been materially increased in bulk and greatly improved in quality, to the advantage of the public health. Vegetables have also been presented to public notice at the exhibitions in larger quantities and in a more attractive manner; and those engaged in the important work of creating new forms and the improvement of existing stocks have received the stimulus essential to sustained effort by the appreciation of the results of their endeavour. Notwithstanding all that has been accomplished, much yet remains to be done, a fact that is fully recognised by those acquainted with the relative merits of varieties and the methods of procedure in crop production. It is recognised by them that substantial advances have been made all along the line; but they believe that there is plenty of room for still further progress, and that its rate might with advantage be greatly accelerated. It has been felt that a properly constituted and capably managed society would be able to render substantial aid in the extension of vegetable culture, the improvement of types, and the bringing into prominence the finest of the varieties in the several sections. Practical expression has been given to this feeling by forming a society, which is to be known as the National Vegetable Society, and its foundations have been so laid as to justify the anticipation that it will attain to a foremost position among the special societies associated with horticulture and floriculture. Fortunately for the stability of the society there is no boom, either existing or impending, in vegetables, and the promoters have, as will be seen from the list we publish in another part of this issue, been careful to place on the list of vice-presidents and the executive committee those who are known to have taken for some considerable period a deep interest in vegetables and their culture, and are consequently in full sympathy with the object of the society. The success of the society will be the measure of the support it receives from those, whether cultivators or otherwise, who are interested in esculents as food products. The object of the society shall, we are told in the preamble to the rules, "be to promote the wider cultivation of vegetables as food products; to encourage their consumption as food, to promote exhibitions of such products, whether competitive or otherwise, and to hold trials under such conditions as may offer, with a view to finding the best varieties to commend for general culture." No more laudable object could well be conceived; but to carry it out in a really satisfactory manner a substantial income will be necessary. Exhibitions of vegetables, as in the case of other products, are costly, and trials are costly; both are essential to a justification of the existence of the society, and they must be conducted on independent lines. The society will, as a matter of course, welcome all the assistance the various firms associated with the seed trade can give; but it should not, and we trust will not, depend so much upon special prizes given by them that the principal part of the exhibitions will be formed by the products in competition for such awards. This we regard as an important point, and we therefore hope those whose trade in seeds is of moderate dimensions, as well as those whose business is on a large scale, and private growers, will recognise their responsibilities and assist in the good work the society will be capable of doing. The recognition of these responsibilities are especially necessary in connection with the proposed trials, as it is most desirable that something should be done with a view to reduce the lists of varieties, and bring into prominence those of special excellence. A substantial reduction in their number would be of immense value both to the seed trade and to cultivators; but the process of weeding out the indifferent ones will be

MR. JAMES BEISANT.

rather slow and involve considerable expenditure, hence the necessity for substantial support. The trials we regard as the most useful part of the society's work, and without them it would be difficult to justify its existence.

Mr. James Beisant, head gardener to Lady Armistead, at Castle Huntley, Longforgan, Perthshire, has for a long time been regarded as one of the most able of the many excellent gardeners in Scotland. He has had charge of the famous Castle Huntley Gardens during a considerable period, and he has added greatly to their high traditions. As a successful competitor at the leading Scottish horticultural exhibitions Mr. Beisant has achieved great fame, both for fruits and flowers. As an exhibitor he is perhaps best known for his long series of successes with chrysanthemums, and it is not too much to say that Mr. Beisant and Mr. T. Lunt laid the foundation of that great enthusiasm that still characterises the Scottish Horticultural Association's exhibitions at Edinburgh in November. A mere list of Mr. Beisant's successes in this direction would occupy more space than we can spare, but rarely does an autumn show pass in the Scottish capital without ample evidence that Mr. Beisant's skill does not abate, even though increasing years have brought increasing duties.

Holland Park Show.—On the occasion of the Royal Horticultural Society's exhibition at Holland Park on July 6 and 7, the Council will entertain the standing committees at lunch at one o'clock. Judging commences at 10 a.m.; the committees meet at 10.30 a.m.; the Council sits at twelve o'clock, and the exhibition opens at the same hour, and the luncheon follows at 1 p.m.

The Masters' Memorial Lecture.—On June 22, at 3 p.m., a large and influential gathering was drawn to the lecture room in the Royal Horticultural Hall, to hear Professor Hugo de Vries, of Amsterdam, deliver the first of the Masters' Memorial Lectures. Sir Trevor Lawrence presided, and Sir Albert K. Rollit, Sir John T. D. Llewelyn, Sir Daniel Morris, and other noted horticulturists and botanists were present, and Professor de Vries received a very warm welcome. He paid high tribute to the work of the late Dr. Maxwell T. Masters, and pointed out that the latter had been a great worker and thinker along the lines of morphological botany, and had in his "Vegetable Teratology" given to the world a work of the greatest importance both to botanists and florists. Teratology helps the doctrine of evolution, and the so-called monstrosities in vegetable life often became the beginnings of new forms, and a florist may from them create new races of flowers, and, if new races, why not new species? thus reasoned the late Dr. Masters. It was at the suggestion of James Salter that Dr. Masters took up the study of vegetable teratology, but his work as editor of the "Gardeners' Chronicle" prevented him from presenting a new edition of his great book, though in the pages of that journal he figured and described the many monstrosities in flowers, fruits, and vegetables that came before him. Professor de Vries, with the aid of lantern slides, showed how a flower might become double by the change of stamens into petals, and how the green rose showed a reversion, its petals gradually changing back into green leaves. The Feathered Hyacinth has its flowers supplanted by coloured pedicels; the elongated axis of a flower as sometimes found in the crowfoot, lily, and clematis; the doubling of the columbine, the suppression of flowers and increase of bracts in the Wheat-ear carnations; the Nepaul barley, with its highly-developed scales and suppressed awns; and the campanulate terminal flower in a certain strain of foxgloves, all served to illustrate the curious variations from the normal, and to show how these variations may be taken advantage of by the horticulturist. Torsion in the teazle, pitcher-leaves in the magnolia, the correllation of laciniate leaves, and fimbriated flowers in the parsley-leaved bramble, were also used as illustrations of this most interesting subject. Teratology, said the lecturer, often suggested botanical affinities. In conclusion, he pointed out that Dr. Masters had endeavoured to secure an appreciation of botanical science on the part of gardeners and an appreciation of the science of horticulture on the part of botanists, as he felt that each was of the greatest assistance to the other.

Changes in Leaf Colouring.—Mr. George Abbott, of Rusthall Park, Tunbridge Wells, directs attention to the effect of protection on the colour of leaves when applied to trees of the copper beech. For the last two years he has, in the spring, partially covered with sacking about half of a small tree (less than 6 feet high), leaving one side open so that there should be some access of light. The aim was to protect a few branches from the effects of frost. This year the cover was put on the part which last year was left uncovered, and about the middle of April, before any leaves had appeared. The cover was removed on May 22 in the presence of several members of the Geologists' Association; the whole of the sheltered leaves were seen to be quite green, and a remarkable contrast to the others. In two days, however, protection being abandoned—the green leaves commenced to resume their usual spring coloration, and now are, with a few exceptions (as where one leaf may have been shielded by another), of the same tint as the other leaves, and probably no one would suspect they had ever been green. The experiment, Mr. Abbott supposes, shows the effect of the cold nights in April and May, which damaged, producing slight chemical change, but did not actually kill, the foliage. In a few months' time all the "copper" colour will, he assumes, have disappeared, and the tree be as green as the common English beech.

Portraits of Darwin.—In association with the Darwin centenary, which was celebrated at Cambridge during the past week, an exhibition was arranged by the Christ Church authorities of portraits, manuscripts, and other objects connected with Charles Darwin. The portraits were of special interest, and included the painting by Sir W. B. Richmond, R.A., representing Darwin in his robes as Doctor of Laws, from the library of the Philosophical Society; and the portrait by the Hon. John Collier of Darwin in his long black cloak, which was lent by the Linnean Society. There were also two crayon sketches of Darwin, by Samuel Laurence, the fine bust by Woolner, and the large bronze head by W. Couper, of New York, which had been presented to Christ Church by the American delegates.

Inauguration Supper at Enfield.—To celebrate the inauguration of the new firm of Messrs. Stuart Low and Co., Bush Hill Park Nurseries, Mr. Stuart Low is giving a supper on Tuesday, June 29, at which not only the new staff and friends will be present, but a large number of those who were in various ways associated with the Messrs. Hugh Low and Co., at the Clapton Nurseries in the old days are expected to attend. This should be an interesting gathering, as we remember that Mr. W. Watson, of Kew, and Mr. Boxall, V.M.H., the famous orchid collector, are old Claptonians.

R.H.S. Gardens Club.—The second annual meeting of the club will be held at the Royal Horticultural Society's Gardens, Wisley, on Saturday, July 10. Train leaves Waterloo 2.28, arrives Weybridge 3.9. Conveyances will take members to the gardens, and tea will be arranged for at the Hut Hotel. Will all members please communicate as early as possible with the Secretary to the club, R.H.S. Gardens, Wisley, Ripley, Surrey, in order that arrangements may be completed.

National Rose Society.—We would remind our readers that the National Rose Society's Metropolitan show will be held in the gardens of the Royal Botanic Society on Friday next, July 2. The schedule of prizes offered for competition on this occasion contains several new classes that should add materially to both the interest and the attractions of the exhibition.

The Perpetual Flowering Carnation Society.—Mr. Laurence J. Cook, treasurer of this society, writes us that the schedule for the December show, just completed, offers largely increased prizes to amateurs and gardeners, and Lord Howard de Walden's magnificent challenge cup (value 40 guineas), which also carries a money prize, is well worth competing for. He also suggests that plants for this show should now be in their flowering pots, and it is not advisable to stop one's plants after the end of this month, excepting in the case of very quick growers. Members will shortly receive the schedule.

The National Amateur Gardeners' Exhibition will be held in the gardens of the Royal Botanic Society, Regent's Park, on Saturday, July 10, at 3 p.m. There will be rose, sweet pea, viola, begonia, vegetable, and fruit competitions, and quite an array of medals and plate is provided for prizes. There will be a military band in attendance, and the price of admission will be one shilling.

International Horticultural Exhibition at Florence, 1911.—The city of Florence, in conjunction with the Royal Horticultural Society of Tuscany, have arranged for a great International Horticultural Exhibition to be held in Florence in 1911, to celebrate the fiftieth anniversary of the proclamation of the kingdom of Italy. The programme contains six sections: Ornamental foliage or flowering plants, either new, or of recent introduction; fruit-bearing plants; vegetables and kitchen garden plants; seeds; bulbs and tubers; Colonial plants; flower decoration; horticultural arts and industries; horticultural literature and instruction; packing and preserving; history of horticulture. Besides numerous awards of merit, grand medals, and objects of art, the committee will place cash prizes and medals to the value of Lire 25,000 at the disposition of the jury. At the same time as the Horticultural Exhibition, a most important Portrait Exhibition will take place in the art rooms, which have recently been restored in the historical municipal palace, the Palazzo Vecchio.

Cape Cantaloupes.—During the past week a consignment of Cantaloupe melons reached Covent Garden Market from Cape Colony, and these sold from 2s. 6d. to 4s. each. Melons from Guernsey, as well as home-grown, have been quite plentiful in the markets, and an early lot of black and red currants from France realised 5s. per basket of 8lbs.

Changes in the Kew Staff.—The current issue of the "Kew Bulletin" contains the following notifications of changes in the staff at Kew: Mr. A. W. Benton, a member of the gardening staff of the Royal Botanic Gardens, has been appointed, at the request of the Secretary of State for the Colonies, on the recommendation of Kew, gardener for Government House, in the Falkland Islands. Mr. J. Hutchinson, whose appointment as assistant for India was recorded in "Kew Bulletin," 1908, p. 421, has been transferred to the post of assistant for Tropical Africa on the staff of the Royal Botanic Gardens. Mr. W. G. Craib, M.A., formerly officiating curator of the Herbarium attached to the Royal Botanic Gardens, Calcutta, has been appointed assistant for India on the staff of the Royal Botanic Gardens by the Secretary of State for India in Council.

MR. J. DONOGHUE'S FIRST PRIZE GROUP OF PLANTS AT THE YORK GALA.

Potato Spraying.—A leaflet on the spraying of potatoes has been issued by the Irish Department of Agriculture. The advantages of spraying the haulm with sulphate of copper solution as a prevention of potato disease is insisted upon, and evidence is given in support of the views of the department. Experiments extending over six years have been conducted, and the increased yields obtained as the results of spraying have ranged from 18 cwt. to 4 tons per acre, the average being more than sufficient to defray the cost of materials and labour. The Department very strongly insists upon the use of pure materials, and the importance of very closely following the directions for the preparation and application of the mixture. It is recommended that washing soda, as supplementary to the sulphate of copper, be used instead of lime. The spraying mixture, when washing soda is used, is more easily prepared, and adheres for a much longer period to the foliage than when lime enters into its composition. There is also the advantage of the nozzles of the spraying machine not being so likely to be choked.

Carnations from Cheltenham.—Messrs. Young and Co., Hatherly, Cheltenham, who have for some years past occupied a high position among cultivators of perpetual-flowering carnations, send us a box of blooms, representative of many of the finest varieties, which had been cut from plants growing in the open beds. The flowers are so highly developed as to show that the system of outdoor culture which obtains in the nurseries of the firm is such as to ensure the production of plants remarkable alike for their health and vigour. The varieties represented in the gathering of blooms include White Perfection, Britannia, Enchantress, Mrs. H. Burnett, Aristocrat, and Imperial, which are so well known for their many good qualities as to render it unnecessary for us to say that they should have a place wherever these fragrant flowers are grown. The flowers are of much interest as evidence of the value of the newer perpetual-flowering varieties for growing in open beds and borders for the production of flowers during the summer and autumn months.

A New Hybrid Solanum is said to have been obtained in Germany, and with reference to it "Nature" says: "An exceedingly interesting problem is presented by the production of a vegetative cross between two species of solanum, the nightshade, and the tomato, defined by the raiser, Professor H. Winkler, as a graft-hybrid. The method of procedure consisted in grafting a scion of the nightshade on the cut apex of a tomato plant; when the graft had matured, a transverse cut was made across the apex at a point where tissue of both scion and stock was present, so that the buds arising from the callus formed at this position might partake of the characters of both species. In this way various adventitious shoots were obtained, which were separated and grown to form independent plants. One of these with distinct characters is the specimen described and named as Solanum Tubingense in the Berichte der deutschen botanischen Gessellschaft (vol. xxvia., part viii.). Subsequently four other hybrids were obtained, which are described in the Zeitschrift für Botanik (vol. i., part v.)." In the course of our experience we have had several supposed graft hybrids brought under our notice, but in no case have they afforded evidence sufficiently conclusive to establish the claims made for them. We shall therefore wait until we have had an opportunity of seeing Professor Winkler's hybrids before expressing any opinion with regard to them.

Kew Bulletin.—The contents of the current issue (No. 5, 1909) of this publication contains articles on the Makruss or Zimbiti (Androstachys Johnsoni), an interesting tree belonging to the Euphorbiacæ, and growing in large numbers in the Mosembe district, north of Mozambique; descriptions of a further selection of exotic fungi; a reprint of an article from an Indian publication dealing with the Myrobalans (Terminalia Chebula), a tree of considerable economic importance for the tannin material it yields; descriptions of African plants; the vegetation of the Pastasa and Bombonasa rivers; and a reference to the disease known as witches broom, which has affected cacao trees in Surinam.

ANTIRRHINUMS IN POTS.

An interesting article appeared in the issue of May 29, from the pen of Mr. Alger Petts, dealing with the outdoor aspect of antirrhinums, and I now present a little digression from that phase of culture. For some years we have derived a useful spring display from these humble snapdragons in selected colours and stocks, and, in our opinion, the plants compare very favourably with other occupants of the conservatory in their season. It is true they need not encroach unduly upon the space regularly set apart for such plants as primulas, cinerarias, forced bulbs, spiræas, calceolarias, or schizanthus, and such-like, because all these subjects claim seasons more or less successional. From the very fact that antirrhinums are not reduced to the commonplace by universal cultivation in pots, they appear to call for comment when presented in their better dress; indeed, some who have seen our stock have criticised their own inaction in that they have not given them a place in their spring displays.

Mr. Alger Petts gives details for dealing with the all-the-year-round supply out of doors, and the same simple details suffice for pot purposes. Antirrhinums are not in the least fastidious in their cultural needs, but there is one point which seems to stand out somewhat clearly, and that is their dislike of any attempt at forcing, but then, it will be remembered in connection with this, that other subjects also resent forcing.

Sown in autumn to flower during the spring months, they possess a character which to many is accounted novel, yet in the summer garden they may from the same persons be adjudged common. The dwarf and intermediate stocks of these snapdragons are those which are chosen for pot purposes; the tall strains are not advised, because under glass there is a natural extension of stem growth, which would need stout stakes and unsightly ligatures. The dwarf varieties easily attain to a foot or fifteen inches, while the intermediates rise proportionately higher, and yet, produced under cool conditions, but very little aid is needed to keep them upright.

Pots six inches in diameter we have found ample for all these types, and in this size it will be clearly seen they are adapted to any form of decoration. It may be possible that a mixture of colours would be of the greatest interest for conservatory furnishing, as there is in most florist's flowers a charm in their infinite variety, but some there are who will prefer to choose separate colours under name. These are matters which claim individual choice and adaptation. It may be said, too, that a succession of bloom may be had by the simple rule of periodic sowing, and advancing or retarding treatment later on. We have made the month of August the select period for sowing seeds, placing these under glass only for the sake of protection. There is, otherwise, no need for glass culture until, in late autumn, the weather calls for protective means, and then only for safety from severe frost.

The first and only aim should be to keep the plants healthy and sturdy; insects do not give trouble until they have advanced to their flowering stage, and then only when subject to extremes of temperature, or contact with infested plants. It will thus be clearly seen that the subject is one which calls for no intricate cultural details, but there is a marked degree of economy in return for which a high percentage of value is given in spring displays. I have already remarked that, grown in pots and flowering during the early months of the year, there is an absence of the common aspect of the flower familiar to everyone in summer. Their season in pots should be so arranged that it closes before the autumn-sown outdoor stocks begin to flower in early summer. In practice it will be found that the same sowing provides the early indoor batch as well as the early summer outdoor display, and, severe as was the past winter, our outdoor bed shows no blank spaces.

PENTSTEMON CRIMSON GEM.
An effective crimson variety, raised by Mr. John Forbes, and shown by him at the York Gala.

YORK GALA ILLUSTRATIONS

We have received numerous congratulations upon the extent and quality of our report of the Great Yorkshire Floral Fête and Gala, that appeared in our issue dated June 19, but these were few as compared with the many expressions of surprise that greeted the Gardeners' Magazine when it appeared at the exhibition on Friday morning, June 18, containing two illustrations reproduced from photographs taken inside the tents on the Wednesday morning.

In the present issue we give three other illustrations. One represents the first prize group set up by Mr. J. Donoghue, gardener to J. Pickersgill, Esq., Bardon Hill, Weetwood, Leeds, that was remarkable for its beauty and its splendid crotons. The other two represent respectively the beautiful Crimson Gem pentstemon, a brilliant bedding variety, raised and shown by Mr. John Forbes, of Hawick; and the very distinct and useful pink variety of the Queen Alexandra marguerite, shown so well both at the Temple Show and at York by Messrs. R. P. Ker and Sons, Liverpool.

THE MOUNTAIN AVENS.

A precious border or rockery flower is the Mountain Avens, Geum montana, whose bright golden flowers come in early summer, and in favourable positions continue for months at a stretch. The plant itself is a beautiful one, the foliage being of beautiful form, and in the highest degree pleasing, with its pretty shade of green and its charming contour, although the latter is what descriptive works are pleased to call "irregular" in form. The irregularity is indeed a charm in the case of these leaves, which, by the way, are also clad, to some degree, with soft hairs.

There are several varieties of Geum montanum, some being much neater and more compact than others. The neatest is of most consequence when it is employed as a rock plant, but there is hardly a weedy variety of this mountain avens in the market. The best and dwarfest varieties with which I am acquainted are only some six inches in height, and these are imperfectly represented by the illustrations we sometimes see of them. As already indicated, the flowers are of a bright golden-yellow, but there is a variety with orange-coloured flowers, which is of much beauty. It is called G. montanum aurantiacum, and is in every way as worthy of cultivation as the golden one. It is of about the same height, and forms a pleasant variety.

There is still another good variety, called maximum, which is taller, and thus better for the border than the others, although it can well be cultivated on the rockery. Its height is about nine inches, or a little more, and those who prefer a taller geum than the two first-named may secure this one.

The mountain avens, although not particular regarding soil, appears to me to like one which is not too heavy, but which has still a fair amount of moisture. On the rockery the moisture is conserved by the stones, and there it seems happiest, giving its bright yellow flowers, not only profusely, but of good size about as large as a two-shilling piece. It is propagated by division or by seeds, and is with me one of the best plants I have, although far from being a rare, or even scarce, thing in good gardens.

S. Arnott.

DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of these popular flowers is "Dahlias and Their Cultivation," by J. B. Wr price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from The Gardeners' Magazine Office, 148, Aldersgate Street, London.

CARTON, MAYNOOTH: THE MANSION AND DUTCH GARDEN.

SOME GARDENS ROUND DUBLIN—II.

◆

Carton.

The town of Maynooth, about fifteen miles west of Dublin, is of considerable historical interest, because it was here that Maurice Fitzgerald, who came over with Strongbow, built the famous castle and fortress in 1176. This stronghold was besieged during the reign of Henry VIII., because of Lord Thomas Fitzgerald's rebellion, but it was only taken after an act of treachery on the part of Christopher Parese, a foster-brother of the Geraldines. But the traitor did not live long to enjoy the money for which he sold the castle to the enemy, for, in the words of Stanihurst, "the Governor willed the money to be tolde to Parese, and presently caused him to be cut shorter by the head."

The ruins of this old castle still remain, and are preserved by the Duke of Leinster, who has extensive property in the district. The College of Maynooth, founded in 1795, for the education of students entered for the Irish priesthood, is another famous building near the town, and one which has at times called into being the most intense political and religious feeling.

For the purpose of these notes, however, Carton Park, the Duke of Leinster's residence, is the most famous place at Maynooth. The mansion is in fine old Grecian style, and was designed by Cassells, a notable architect of his day. It is reached from Maynooth by means of a long, broad avenue of lime trees that commences almost in the town itself. The park and grounds are finely wooded, and, as there is an abundance of water, they provide any number of beautiful scenes and many delightful walks.

Of most unusual character is the garden to be found along the garden front of the mansion. It is a combination of the old Dutch or Elizabethan style with the more modern method of freely grouping alpine and herbaceous plants on and around rock work. There are four square gardens, divided by lawns and paths, and with a small ornamental lily pond occupying a central position. Yew hedges, kept trimly in shape, form the boundary of each garden, and it requires no great effort of imagination to fill these gardens with beds of geometric design, planted with flowers set out in regular order. One naturally expects that this sort of thing will be found within the sheltering hedges, with an accompaniment of seats, sun-dials, and topiarian designs, carved out in yew and box and holly. It therefore comes as a distinct surprise to find each formal garden informally filled with a large collection of alpine and herbaceous plants. This rearrangement of an old garden is due to the late Duchess of Leinster, mother of the present Duke, who had a great love for the garden, and took the keenest interest in its welfare, and made many notable additions to its many fine attractions.

Some very fine old pyramidal Irish yews line the grass border the whole length of the garden front, and they are wonderfully fine old specimens, probably among the largest and shapeliest to be found anywhere. These are continued right to the grass steps leading down to the tennis courts that nestle amid beautiful beeches and giant Atlantic and Lebanon cedars. A winding walk near-by leads upward, amid fine trees and groups of flowering shrubs, to the little private cemetery where lie the remains of several Dukes and Duchesses of Leinster. It is a little garden cemetery, a beautiful burial ground. A giant old beech tree is the warden of the cemetery, and his bowing branches bid you remove your hat as you pass within the low wire fence, now almost hidden by rambling roses of the Wichuraiana family. Roses are plentiful in this quiet resting-place, and what better flowers could speak of all that is beautiful and fragrant in life, or suggest more eloquently the hope of the life to come? Not here are the stately and funereal cypress and yew, but the grace and beauty that only roses in their many kinds and varieties can give.

I find these notes have commenced in the middle of the subject, and so I must refer back to the great gardens that are near the house where Mr. A. Black, the head gardener, lives. These are some distance from the mansion, and connected by a broad winding path that leads under fine trees, amid masses of rhododendrons, azaleas, forsythias, lilacs, weigelas, philadelphus, and other flowering shrubs, and also by the water side, where bamboos and arundos, gunneras, and phormiums, add boldness and grace to the multitude of irises, and throw graceful shadows into the water to meet the glory of the great masses of the fine kinds of water-lilies growing there.

There are eleven acres of walled-in gardens at Carton, and within these walls fruit and vegetable cultivation is carried out on an extensive scale, and with the greatest success. Strawberries and horizontally-trained apples and pears are particularly well managed, but one feels that in this sheltered spot the skill of the gardener is admirably seconded by the favourable soil and climate. Almost every gardener grumbles over one or both of these things, but those who are worth their salt manage to secure good crops, whatever the kind of climate or quality of the soil. For once in a way I heard no grumbling at Carton.

Very fine is the picture that presents itself as one turns into this enclosed garden close by Mr. Black's house, for from this point three broad walks diverge, one passing along the left and another along the right-hand sides of the garden, and the third cutting diagonally across the enclosure. Each path is bordered on either side with herbaceous plants, supplemented by annuals, and a more brilliant display of these plants it would be difficult to conceive. No very rare plants are here found, though good varieties of pyrethrums, pæonies, delphiniums, and the like are grown, but the splendid effect produced emphasised the fact that gardens may be made beautiful beyond the power of pen or brush to describe by the free use of what the specialists would, perhaps, call common flowers. The great interest of rare plants is beyond question, but, alas, the culture of many is often vanity and vexation of spirit. For garden decoration, give me the fine group of popular flowers, as seen at Carton—the great clumps of sweet peas, the breadths of Newbury Gem pentstemons, the wealth of violas and pinks, the stateliness of delphiniums and lupins and bocconias, and the brilliance of gaillardias, heleniums, helianthuses, and the like. These and other subjects that readily come to mind under the general heading of old-fashioned garden flowers, will, with good culture, work wonders in garden scenery.

[Photo: Lawrence, Dublin.

CASCADE AND LAKE IN THE GROUNDS AT CARTON.

Beyond this garden are the many acres of orchards that yield bountifully. On the pleasure ground side, a striking feature is the pergola built by the late Duchess of Leinster. The present Duke of Leinster inherits his love of gardens and gardening from his mother, and also from his grandmother. He is keenly interested in trees and shrubs, and in the timber on his beautiful estate, but probably he takes the greatest delight in the pergola and its surroundings. The pillars are of solid masonry and the cross-beams are heavier than usual; under the pergola there runs a raised paved pathway, with low steps at either end. So far as is known, this was the first pergola to be built in an Irish garden. Roses in great abundance clothe the pergola, and these are assisted by jasmines, ornamental vines, Aristolochia sipho, choice ivies, etc. The outer walls of the enclosed garden hard by, support roses of many kinds, notably a great mass of R. multiflora, Romneya Coulteri, Buddleia variabilis, many species of vitis, Piptanthus nepalensis, and other beautiful subjects. One long wall, near the water side, with its colony of interesting climbers, might well serve to hold one's attention for an hour or two, but I must again skip across the garden front, and briefly deal with the other part of the grounds.

Not far from the little cemetery a winding walk, amid rhododendrons, leads to the long Bower Walk. This elevated pathway crowns the high bank of a large lake, and leads for a very long distance through a semi-wild garden, where native plants are encouraged, and bulbous plants, polyanthuses, irises, etc., are naturalised. The Bower Walk leads to the Shell House, a kind of museum and tea-house, containing trophies of the chase, curios from various parts of the world, and natural history specimens of local interest. A new rose garden has been made here. It is of triangular shape, and furnished with beds of H.P. and H.T. roses. Honeysuckle and Aristolochia sipho provide covering for the entrance arches, but inside there are numerous arches and pillars of the popular climbing roses, while the wire fence round the garden carries a great variety of Wichuraiana roses.

Nothing has been said of the glass department at Carton Park, and there only remains space to say that it is an extensive one, admirably kept, and contains a great variety of plants and a full complement of fruits, and that a new heating plant has recently been installed.

Straffan House.

From its rise in County Wicklow, to its discharge into Dublin Bay, the silvery Liffey passes through—in fact, provides—many a fair scene, notably in the county of Kildare, but—

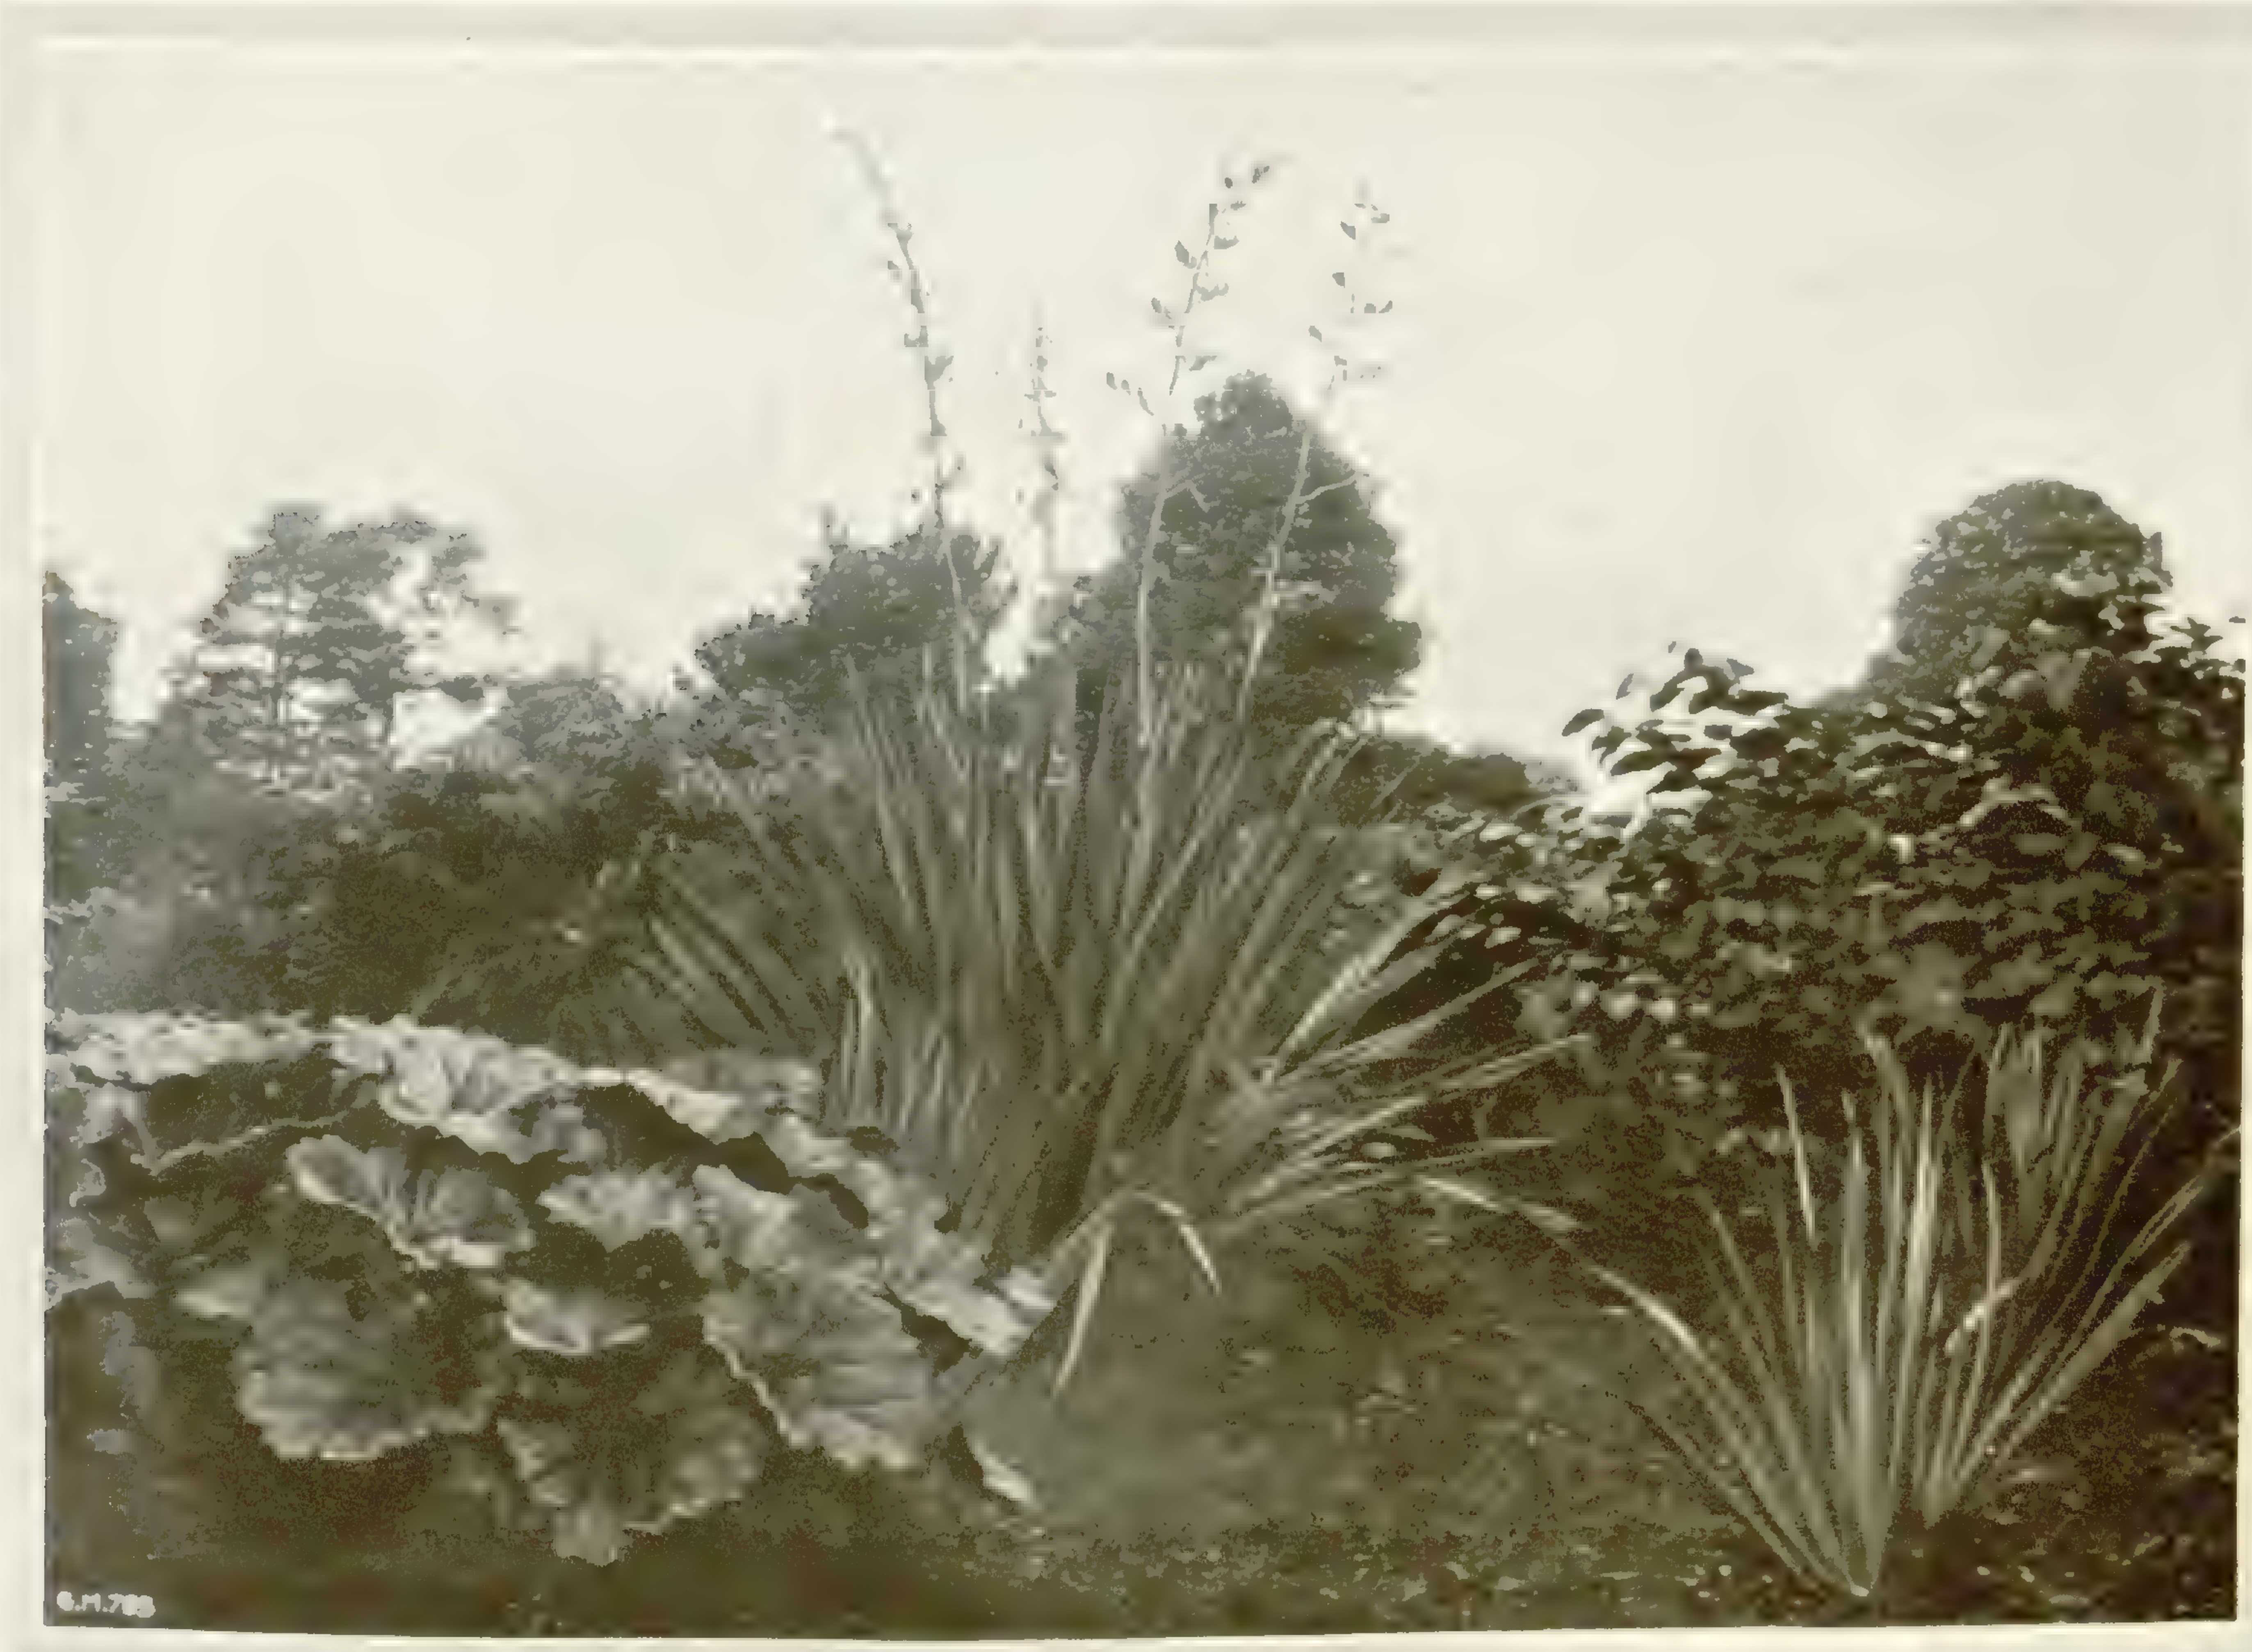
> "The Isle of Green has many a scene
> More brave, but not more fair,
> Than where the Liffey silent flows
> By Straffan, in Kildare."

The first glimpse of Straffan House, the residence of Bertram H. Barton, Esq., is obtained from Straffan Bridge, that carries the public road over the Liffey, and, though the picture presented is a charming one, it does not satisfy, but only excites curiosity and a desire to inspect more cl the beauties of such a delightful spot. L it be said at once that the members of Barton family, who have successiv owned Straffan House, have always shown a great interest in the garden, and never denied to a garden lover the pleasure of inspecting its many and varied charms. Further, Mr. F. Bedford, who has had charge of these famous gardens for thirty years, and knows every plant, almost every blade of grass, in them, is always happy to show a visitor round.

No doubt there is a limit to the grounds and gardens of Straffan House, but neither these, nor the beginning or end of the gardens are discoverable, save, perchance, by those very intimately acquainted with the place. Every spot is gardened, and every part is full of interest, from the choice conifers grouped upon the lawn in front of Mr. Bedford's house, right away to the flower-fringed borders of the river, and the lovely garden island, with its wealth of bamboos and lilies. One must begin somewhere, and so, leaving the golden yews and cypresses, and just referring to very fine specimens of Cæsalpinea japonica and Magnolia Lennei against the wall, we will begin with the formal flower garden that is right in the midst of the kitchen garden, in front of an old range of fruit houses, and within high, sheltering walls. An unusual place for a flower garden surely, but then Straffan is an uncommon garden, and an uncommonly beautiful one also. The flower beds are box-edged and surrounded by gravelled paths. I believe there are no fewer than one hundred and six beds, so that summer bedding is not a pastime merely. Here are some of the subjects used, chiefly one subject in a bed, and splendid standard heliotropes rising well above them: Glory of Zurich salvia, Pittsburg Crimson Gem and Newbury Gem pentstemons, Begonias Sedeni and Lafayette, abutilons and pelargoniums in variety. In every case, the beds are in duplicate, the garden being halved by a central walk. Pillars of roses, arches of roses, and beds of pegged down roses are near by, and in great profusion. Added fragrance is given by the long rows of sweet peas beyond the flower garden proper.

A very clean and well-kept kitchen garden is this, and it contains a fine collection of young bush apple trees. Fruit and vegetable cultivation go hand in hand with flower gardening, and a very high standard of perfection is attained in all. Asparagus is grown in single rows and planted in leaf-mould, otherwise it would be lost in about four years, so cold and wet is the soil—you would hardly think any difficulties of this kind had to be surmounted here unless they were pointed out specially. Lord Suffield is the favourite late strawberry, and from two-year-old plantations Mr. Bedford obtains from four to six pounds weight of fruit per plant.

Passing a fine tulip tree and a large specimen of Magnolia acuminata, one soon enters another enclosed garden, smaller than the first. Beds of zinnias and phloxes attract attention, and the roses are again abundant, Ophir and sempervirens being notably fine. Near the wall, in boggy soil, is the renowned plot of the lovely Cypripedium spectabile, a hardy orchid that luxuriates here. This plot has often had four hundred flowers expanded at once, and on one occasion four hundred and fifty open flowers were counted. Primula capitata is another plant that grows here like the proverbial weed.



FINE GROUP OF SUBTROPICAL AND MOISTURE-LOVING PLANTS IN THE ISLAND GARDEN AT STRAFFAN HOUSE, CO. KILDARE.

And now the glass-houses come under review. There are modern houses, and there are very ancient ones, for some of the vineries are seventy-eight years old. The contents of the houses are very interesting because the collection is large in the matter of variety. Ixoras are a feature, and there is a very fair collection of orchids, dendrobiums, odontoglossums, Vanda cœrulea, and cattleyas being notably good. Ixoras and crotons are excellent, and climbers are a good feature, Dipladenia amabilis, D. Brearleyana, Ipomæa Horsfalli, and Passiflora kermesina being conspicuous examples. Maidenhair ferns abound in the various houses, and the new nephrolepises are grown. One old N. exaltata, in an 8in. pot, suspended over a tank, has thrown its roots and runners down into the water, and has now become a fine specimen, yards long, as a result of having its toes in the water. Foliage begonias are fine, and there is a goodly collection of rhododendrons and azaleas. Combretum purpureum is another old plant well grown, and the fragrant Luculia gratissima is represented by a very big example. Popular subjects that find a place in most gardens are here represented also by larger or smaller batches, but the Straffan glass department is worthy of special mention, because these things are not the only ones grown. It is unusually interesting also in these days because private collections of stove and greenhouse plants are becoming rarer and rarer, and one finds the same kinds of plants in so many establishments.

Straffan House, with its white walls and its water tower, is pleasant to look upon, and suggests comfort and homeliness. The lawns slope down to the willow-margined river. On the river side of the house is another flower garden, guarded by a dozen trim yews, and from the higher terrace walk some delightful views are to be obtained, for the country all around is very beautiful and fertile. Some fine trees occur near this flower garden, notably of Sequoia gigantea, Cupressus nootkatensis, various hollies, including a magnificent scarlet-berried weeping specimen, as well as noble beeches and graceful lime trees. Among shrubs that are a fine feature hereabouts, one remembers the splendid beds of pernettyas and the gorgeous golden elders.

Beautiful as are the Straffan gardens as a whole, the gem of greatest beauty is the island garden. This is reached by a pretty suspension bridge, erected in 1849, and now almost taken possession of by a big ivy, whose thick, tough stems look quite capable of bearing the strain should the ironwork ever give way. It is impossible to convey anything like a good idea of this island garden, but it is a lovely spot, and shows the loving care that the Barton family and Mr. Bedford have bestowed upon it, a care shown by the fine development of the plants rather than by any wonderful design. It is a subtropical garden, where bamboos are thoroughly at home. A sandy soil prevails, assisted by river mud and the decomposition of grass and leaves, but the whole island is continually moist, and is sometimes submerged during very heavy floods. Arundinaria japonica, A. falcata, Phyllostachys Quilioi, P. nigra, P. viridiglaucescens, Bambusa Simoni, B. nitida, B. Metake, and B. palmata are some of the bamboos that do so much to make this island a beauty spot. Gunnera manicata is magnificent here, and there are several grand old specimens. Phormium tenax and its variegated form thrive equally well, and throw up their giant sixteen feet spikes of flowers regularly. Big polygonums add their vigour and grace and freshness to the scene, and the colonies of Lilium pardalinum add a distinct charm and beauty. The ground is carpeted with daffodils, snowdrops, primroses, and Dogs'-tooth violets that all yield their quota to the scene. It is an excellent example of free landscape gardening is this island garden, and the highest praise one can give to it and to the Straffan gardens altogether is, that everything seems to have grown up at the right place, as though Nature and not man had designed the planting.

Glasnevin Botanic Gardens.

The most famous garden in all Ireland is the public one at Glasnevin, wherein are gathered the botanical and horticultural treasures of many lands and climates, for the purpose of educating those willing to learn. Some fifty acres or so of land are enclosed to form this national garden, and not only are these crowded with a wonderful variety of plants, but the grounds are admirably laid out, well kept, and exceedingly attractive. Mr. F. W. Moore, the very genial and able director of the Glasnevin gardens, has probably now a larger collection of plants than exists anywhere else on the same amount of ground. He fully comprehends the scientific value of the gardens and the collections, but he also remembers that not everyone is a botanist, and that those who love flowers and beautiful plants have claims to be recognised as well as the scientist. The grouping of trees and shrubs is in the best taste, and the alpine garden was a feature long before the present popularity of rock gardens commenced. Bog and water gardening are here to be found, but the area devoted to them is necessarily small.

Mr. Moore, as already hinted, believes in catering for the general public, but he does this in a manner that educates as well as pleases. Last year the National Sweet Pea Society held its provincial show in the Irish capital, in conjunction with the Royal Horticultural Society of Ireland (of which latter body Mr. Moore is hon. secretary), and so Mr. Moore provided a large display of sweet peas in the Glasnevin gardens, planting each variety to form one clump. The newer varieties were well represented, and grown up circles of wire netting. This collection, arranged along one border, proved very interesting, and, as the newest kinds were grown near the older ones there was ample opportunity for making comparisons and judging which were the best, or which one liked the most.

Another very great attraction is the flower borders, where a fine selection of hardy herbaceous plants provide a delightful display over a long season, assisted by asters, double larkspurs, candytufts, and many other beautiful annuals. No delicate plants or those not easy to manage are to be found here, consequently visitors may make notes freely, safe in the knowledge that they may have an equally fine display of similar plants, if they provide the necessary room and afford reasonable care. Many of the rarer hardy or semi-hardy plants are skilfully grown close up the walls of the numerous glass-houses; for instance, Crinum Powelli and Kniphofia caulescens are represented by fine groups in such positions. Iris stylosa, Gerbera Jamesoni, the new Golden Glory calceolaria and Agapanthus umbellatus also do well in these sheltered spots, and outside the big Palm House there are beds of succulent plants. Trees and shrubs are in excellent health, and include a good collection of oaks, a fine Magnolia conspicua, a notably fine White Beam tree, Catalpa bignonioides, Magnolia grandiflora, and roses in variety, Caroline Testout, and La France being very fine. Some trees are of considerable size and age, for there was a garden here long ago, when the poet Tickell lived at Glasnevin, and when Swift and Addison resided in the neighbourhood. The gardens next belonged to the Royal Dublin Society, and latterly came to be under Government control. It is fortunate that the direction of these famous gardens has descended from father to son, for Mr. F. W. Moore, who is generally recognised as possessing an unusually wide knowledge of plants, succeeded his father, the late Dr. Moore, as director. Mr. Moore is also a clever botanist, a skilful grower, and a successful hybridist. Not a few of the rarer "botanical" orchids have flowered under cultivation for the first time at Glasnevin. Who has done so much to increase the number and beauty of lachenalias as Mr. Moore? and where else but at Glasnevin can one find the ungracious Nepenthes Rajah growing as it does here?

The collections under glass are extensive, and though some of the houses are old-fashioned, the department is, on the whole, in good condition, and improvements and rebuilding are taken in hand as opportunity offers. In the fernery there are some giant cyatheas and gleichenias, and the cases of exquisite filmy ferns contain beautiful specimens of Todea Moorei, T. superba, and Trichomanes radicans. In the aquatic house the Victoria regia is a never-failing attraction throughout the summer, and in the same tank are nelumbiums, Cyperus papyrus, and Nymphæa Lotus, etc. There are two succulent houses, and one contains a big columnar Cereus giganteus and some noble agaves. One also noticed a fine batch of the beautiful little Trichinium Manglesi in one of these houses, full of its fluffy heads of bluish flowers.

In other structures near by are large Himalayan rhododendrons, Clethra arborea, Araucaria Cooki, and A. Bidwilli, the graceful Wildenovia teres, and Phœnix dactylifera, the side stages of the houses being made gay with Nicotiana Sanderæ, zonal pelargoniums, liliums, salpiglossis, and other popular greenhouse plants. Two smaller houses, one filled with superbly grown tuberous begonias and the other with an equally fine lot of the best varieties of zonal pelargoniums, were particularly attractive on the occasion of my visit, and gave the lie to those who so often contend that plants are poorly grown in botanical gardens, but who never go to see lest they might be compelled to alter their opinion.

One wall of the large Palm House is covered with the rampant Monstera deliciosa, and it is one of the few subjects planted out. Very big seaforthias, Bambusa vulgaris, rising to the roof, Phytelephas macrocarpa, with a big, graceful head, and a lofty Oreodoxa Sancona, were a few of the more notable plants in a goodly collection. Bromeliads are largely grown and so are nepenthes. In one of the stoves the brilliant Brownea Ariza was flowering, and the quaint Aristolochia tricaudata was an attraction, if not exactly a beautiful one. Here, too, was a fine specimen of that new and graceful fern, Polypodium Knighti, with long, pendulous fronds of great elegance and beauty.

Glasnevin is a paradise to the keen horticulturist and the botanist, and if a whole week were spent in examining its collections, some idea of their extent and richness would then begin to dawn upon one. These notes attempt the impossible, i.e., to convey in a column or so of text what Glasnevin is like. The illustrations will help the text, but perhaps the best description one can give is to liken Glasnevin to a small edition of Kew.

Charles H. Curtis

BEAUTIFUL GROUP OF CYPRIPEDIUM SPECTABILE IN THE GARDENS AT STRAFFAN HOUSE, CO. KILDARE.

Salvia splendens should now be shifted into their flowering pots, using a compost that is not too rich. Pot firmly, as they are apt to grow away pretty freely, and stand them in a good open position where they can have plenty of syringing. Some prefer to plunge the pots in ashes, but I like a good stocky growth, and plunging rather tends towards softness.—T. S.

Mertensia virginica or pulmonarioides. — A handsome border plant is Mertensia virginica, the Virginian Cowslip, Tree Lungwort, or Blue Bells, and one worthy of more extended cultivation. It is not one which is so much seen in our gardens as Mertensia sibirica, and it lacks to some degree the beauty of the latter, yet its good habit of growth, from a foot to two feet high, and its racemes of showy blue-purple flowers, each about an inch long, make it a good plant for the mixed border of herbaceous flowers, or for the choicer parts of the wild garden. It is a hardy plant, and to see it in perfection should be cultivated in moist parts of the garden. In its own lands it affects the neighbourhood of streams and low meadows, a liking which points to the desirability of giving it a situation not too dry with us, if we wish to see it at its best. It is increased by seeds or by division. The name of M. virginica is so firmly fixed that it will be difficult to supersede by that of M. pulmonarioides, now recognised as the correct one.—S. A.

WHEN TO SOW A LAWN.

The best time to sow down a lawn has long been a moot question, as the successes and failures in spring and autumn, on different soils and under varying climatic conditions, have secured advocates and opponents for both periods. Except in very favoured localities, such, for instance, as the west and south coasts, and Ireland, no attempt at sowing down a lawn should be made till after the middle of April. When the soil is of a cold, heavy nature the beginning of May will be soon enough to commit the seed to it in ordinary seasons. If sown earlier, and especially in cold springs, the seeds rot, and the hardiest and coarsest only are able to survive the ordeal. Besides a cold soil acting inimically on the seed, we sometimes have cold cutting winds to contend with, which absorb all the moisture, and wither up the young plants.

[Photo: Lawrence, Dublin.

VIEW IN THE GLASNEVIN BOTANIC GARDENS, DUBLIN.

When provision has been made at seed sowing time to conserve the moisture in the soil, and protect the seed from birds, by applying a fairly thick coating of short grass from the mowing machine, the results will not be so disastrous in adverse weather as would otherwise be the case. Besides helping to keep the soil moist, the short grass eventually rots, and feeds the young plants. This protecting, fostering top dressing, however, is not always a sufficient guarantee for a good lawn, as cold and drought may even prove too much for seeds or seedlings in spite of its aid, nevertheless, it enhances the chances of success, and should always be employed where possible. These mowings should be free from heads of daisies and plantains, or seeds of these weeds will be conveyed to the new lawn.

A year ago last April and May I saw several lawns sown down under these conditions which were fit for playing upon by the end of July. The weather at the seed sowing time was warm and showery, and every seed seemed to germinate. Last April and May I saw another lot of lawns sown down under similar preparations, but the weather was cold, windy, and dry, and although some are moderately well covered, compared with those which got no protection, yet they are not what could be termed satisfactory.

Under the best conditions for the germination of seed, and the growth of the young seedlings, we find that spring sowings cannot be trusted to produce the most satisfactory results unless favoured with suitable weather. Having satisfied myself on this point, I have, for some years, advised my friends to sow their lawns immediately the soil is thoroughly moistened, after the middle of August. One large piece of ground I saw levelled in August last, and sown down the first week in September, and by the end of October it had formed a good turf. This spring it looked like a turf of five years' existence under good treatment, and it has been freely used for tennis and croquet. The levelling operations were carried out in a manner to retain six inches of the best surface soil on the top, with a good thick layer of well decomposed manure immediately under it. As the soil is warmer in autumn than in spring the seed germinates more quickly, and the seedlings grow more freely.

Birds, too, are less troublesome in autumn than in April, as they are usually amongst the corn fields at the end of summer, and less hungry than in spring. Everything considered, the best time to sow down a lawn is between the middle of August and the end of the first week in September, if the soil is moist. At this period there are no daisy heads among the mowings, and the short grass can be used.

If anyone contemplates the sowing down of a lawn I would strongly advise it being ready for the seed by the time stated. If this is done in accordance with the suggestions conveyed in the foregoing notes, and 1lb. of seed of the right kind of grass to suit the soil employed for every 30 sq. yards, a lawn well able to stand the wear and tear of tennis or croquet will be provided for next spring.

Pedestrian.

WITTMANN'S PÆONY.

The glorious flowers of many of the herbaceous pæonias are highly appreciated by both amateur and professional gardeners, and there are few indeed which do not deserve all the admiration they receive. The flowers are often of the most lovely colourings, the form is generally of great beauty, and the whole aspect of the plants very beautiful indeed.

A pæonia species which is little known to the amateur, and which has for years been scarce and rather expensive, is gradually but slowly finding its way into gardens as its price slowly drops and brings it more within the reach of the flower lover of moderate means. This is Pæonia Wittmanniana, a very charming species, with flowers of a delicate primrose-yellow, not so large as those of some of the varieties of P. officinalis, but of great beauty of form and of pleasing colour. These flowers are single, and are succeeded by bright coral-red fruit.

Wittmann's Pæonia is one which is but a shy flowerer for some time after planting, and some patience is requisite before flowers are produced. It is best cultivated in a rich soil, well manured, and is one of the pæonias which prefer a partial shade. It should have a place where the sun cannot reach it before ten or eleven o'clock, yet where it will not be exposed to its full glare at midday. A half-shaded place near trees is excellent except in cold districts, where, naturally, a little more sun is required. Still scarce in gardens, this species is a favourite with all who grow it, and who have had it long enough for it to bloom in their hands. Plants can be had in pots, and can thus be planted out at any time. Should roots from the open ground be obtained, however, they may be best planted during the time from the beginning of September to the end of April.

S. Arnott.

HARDY FRUIT PROSPECTS.

The promise a short time since of an abundant fruit crop, I am afraid, will not be realised, at any rate, in this district. Practically all kinds of fruit showed well, as almost every tree and bush was in its season well furnished with blossom. The dry weather which we experienced during the latter part of April, and the absence of severe frosts, was very beneficial to the setting of the fruit on the early-flowering varieties of pears, but the later sorts, such as General Todtleben, etc., suffered very much from frosty nights, from two to six degrees of frost being registered almost nightly during the first half of the month of May, practically destroying the whole of the young fruits on these trees. Plums on walls will, I think, be a fair crop, but on trees growing in the open the crop will be thin, frosts again being the cause of a poor set. Damsons are more satisfactory, for the foliage at the period when the most severe frosts were experienced was well developed, thus acting as a protection to the young fruits. The early flowers on the strawberries were blackened and destroyed by frost, but the later blossoms have set well, and promise well for a good average crop.

[Photo: Lawrence, Dublin.

ROCK GARDEN AND LONG WALK AT THE GLASNEVIN BOTANIC GARDENS, DUBLIN.

Bush fruits, such as gooseberries and currants, are a good crop, but raspberries will be a much smaller crop than usual, the severe winter having weakened the upper portion of the canes very much, destroying three or four of the uppermost buds in many cases, and, in a few instances, killing the canes down to the ground, but, I am pleased to say, the young canes are pushing up as strong as ever.

Fruit on the dessert and Morello cherries is quite satisfactory. Apples, I am sorry to say, will, with us, this season be a very thin crop, and yet nothing could have looked more promising than did the trees when in full flower, but the continued frosts which were experienced during that period, played sad havoc with the crop. A few varieties promise fairly well, but the fruit on the majority of the trees, I am afraid, will be conspicuous by its absence. Cobs and filberts should be a fair crop, as the weather was dry when the catkins were in bloom, and only slight frosts were noted at that time; but the sharp frost on May 19 (6 degrees) completely destroyed all hopes of gathering a crop of walnuts, as the male catkins were destroyed, and fell to the ground on the morning after, and the young foliage was also blackened, as if scorched, and has been gradually falling from the trees since. **Geo. Woodgate.**

Rolleston Hall Gardens.

SWEET ROCKETS.

These charming old-fashioned and sweet-scented flowers (Hesperis matronalis and H. m. flore pleno) should have a place somewhere in every garden, for their very name suggests the sweetness and repose of old country gardens before the hustle and bustle of modern life began. Hesperis is a name for the evening star, and they are mainly plants for the evening, as it is then that they smell their sweetest, while their white and pale purple or lilac flowers seem to show up better by contrast than during the day. There are two main forms, the single and the double, and their cultivation is so different that we must deal with them separately.

The single rocket is sometimes spoken of as perennial, but it is best treated as a biennial, that is, sown in July for flowering the following May and June. They are mostly white, with shades of lilac and purple. When once established in a garden and allowed to seed they may be relied upon to maintain themselves, though they never become a troublesome weed. They are admirably adapted for shrubberies and the wild garden.

The double rockets are much more valuable, and much less easy to grow. There are three or four different forms of them: the tall white—the flowers of which acquire a tinge of pink after they have been out some time—the dwarf white, the tall purple, and the lower-growing form of the same colour. The purple in both the single and double forms are sometimes known as Dame's violet, or damask violet. The tall white is the most valuable of all, and is worth some trouble to cultivate. These double rockets, if left to themselves, very soon die out, and, though perennials, they are plants which need annual attention. They will grow in any fairly moist soil, but it should be deeply cultivated, and moderately rich, and if it is in partial shade so much the better. One method of managing them is to lift them and divide them every other year in the early spring when they are just coming up, and, as this impairs the blossom for that year, some should be attended to one year and some another, a reserve of plants being kept in a nursery bed and put into their flowering positions in the autumn. Another way is to thin out the shoots in the spring, when they are about three inches long, and dibble them in a nursery bed in a shady position, keeping them from any hot sun which might reach them at any time of the day. In this way a nice bed of reserve plants may be obtained, while the remaining shoots on the flowering plants will produce all the finest heads of blossom for the thinning out. Yet again others recommend cutting them down close after flowering and making cuttings of the side shoots. Perhaps the best plan of all is a combination of these methods, according to one's success or otherwise with the plants, or one's desire for an increased stock.

Alger Petts.

RAISING STRAWBERRY PLANTS.

Except for producing new varieties, the best and simplest way of propagating the strawberry is that of layering runners in pots, and the time has arrived when preparations should be made for carrying out this operation. The strawberry naturally and readily increases from runners, and plants to furnish new plantations can be easily and cheaply secured by lifting those that have rooted in the soil around their parents, but in the end this is not a profitable or a satisfactory mode of procedure.

The best plan for those who intend making new plantations is to either raise for himself plants in pots, or purchase such from a nurseryman. In reference to this it may be remarked that it is beneficial, as is so well known to be the case with the potato, to periodically change stock, and as a proof of this it may be said that from the time Royal Sovereign was distributed until a few years ago we annually raised the plants we required of this variety from our original stock, but, owing to the gradual weakening of the plants, we secured a fresh supply from a distant nursery, with the result that we have now, both for forcing purposes and for plantations in the open, plants as vigorous and fruitful as formerly.

The best runners are to be obtained from plants that have been planted the previous season and not allowed to fruit, though if well cared for, plants of this description that are allowed to carry moderate crops of fruit will also produce good runners. As soon as the plantlets commence to push roots layering operations should be begun by filling three-inch pots to within half an inch of the rim with loam, which, if inclined to be heavy, should be lightly mixed with pulverised horse manure, or material from a spent mushroom bed Select the first plantlet upon each runner, and cut away the extending part ; place the pots in convenient open spaces between alternate rows, to afford convenience in watering, and, by a small peg, secure one plantlet to the soil in the centre of each pot. If, as should be the case, the parent plants are mulched, the pots should be plunged in the mulching material, for this will keep the soil in the pots cool, and comparatively moist, and thus accelerate growth.

If the runners are kept carefully watered, syringed in dry weather, and free from other runners, and weeds, they will readily fill their pots with roots, and as soon as this takes place they should be severed from their parents, and be placed for a week or so, until they recover from the check, upon a bed of ashes in a shaded position, after which no time should be lost in planting them in their permanent quarters, and for this, if opportunity offers, a dull, damp time should be taken full advantage of.

Plants intended for forcing should be raised in like manner, and be shifted into their fruiting pots when the others are planted. Some growers advocate layering into the fruiting pots, but should a wet season set in, and cause the soil to become sour (as it is likely to do) before the plants are well rooted, much mischief would result from this practice.

Except in the case of Vicomtesse Hericart de Thury, which is grown for preserving purposes, and a few other varieties that fruit best the second year, we do not keep plants after the first year, for we secure from most kinds the finest fruits—and these are wanted for dessert—from yearling plants ; but where quantity, and also really good fruit is required, in preference to fewer of the very finest, the plants should be grown the second year.

The Hendre Gardens. T. Coomber.

HERBACEOUS BORDER AND GLASS HOUSES AT THE GLASNEVIN BOTANIC GARDENS, DUBLIN.

SPARROWS AND GREEN-FLY.

It is not often, I am sure, that any gardener welcomes sparrows in his garden. But I am pleased to see them in my garden at the present time. I have never before been troubled with green-fly on such various plants as during the present year. These pests always increase rapidly during a period of strong sunshine and cold winds. My garden is well situated ; it is a regular "sun trap," but the cold air reaches it, though not in direct currents. Green-fly has been most troublesome on my sweet peas ; when the ends of the shoots of the latter are cleared of the pest one day they seem to be as badly infested again the following day. Now the sparrows have begun to wage war upon the fat insects.

I remember, two years ago, watching some sparrows eating green-fly off my carnation plants ; and just previously I had read an article in which it was confidently asserted house sparrows did not eat green-fly. A gentleman wrote to me soon afterwards and informed me that to make sure that the birds had actually eaten these insects, he shot some, opened their crops, and found the green-fly there, but not any portions of plant leaves.

Last year I was much interested in watching the aphides disappear into the beaks of the birds, and I never found that the birds damaged the sweet pea foliage, nor the flower buds.

Possibly, Mr. Editor, some of your readers or able contributors have noticed the action of these birds. Early in spring the sparrows eat the young "grass" of carnations wholesale. Geo. Garner.

For pretty gardens and lovely flowers read The Flower Garden, by T. W. Sanders, F.L.S. An up-to-date work on the formation, planting, and management of the garden, with description and cultivation of flowers and plants adapted for outdoor culture. Price 7s. 6d. net, by post, in box, 8s., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London

EARLY ROSES.

Although we have several new additions to early-flowering roses, the proverbial month of blooming has been less filled than usual. I cannot call the season early in this district (Mid-Sussex), and most of the plants that I have noted for some years were fully a fortnight later in flowering than the average date. Nor are our first flowers so good as usual. Blistered foliage, crippled growths from cold, and the ravages of the rose maggot are prevalent upon almost all sides. Green-fly has also been very troublesome, and much of the young growth is so checked by unfavourable weather that our prospects are far from rosy at present.

But it is surprising how very rapidly roses will grow during a few weeks of suitable weather; even a few days makes a remarkable difference in their condition, and we are by no means so dependent upon our first crop of bloom as used to be the case. With the grand teas and hybrid teas now in cultivation the season is more continuous, and we do not miss the show of Damask, hybrid Chinas, and Bourbons nearly so much.

A few roses that never fail to give us an early display are the Scotch and Austrian Briars. Lady Penzance is also very early and secure. In Electra, Waltham Bride, and Bardou Job we have three that come very early, and make a grand contrast as pillars. Upon favourably situated walls, too, Marie Van Houtte, Madame Lambard, Madame de Tartas, William Allen Richardson, Lady Roberts, Antoine Mari, Reine Olga de Wurtemberg, Rêve d'Or, and others are in fairly good condition where they have been freely syringed for the fly and maggot. Gloire de Bordeaux, an old rose of 1861, has bloomed very freely. As a rule, this is a mid-season and autumnal bloomer, and is one of the hardiest climbers we have, standing frost even better than its parent, Gloire de Dijon.

Some few cutbacks among the hybrid perpetuals are coming into flower freely, but here also the foliage is much crippled. Among the earliest we find Gustave Piganeau, Captain Hayward, Robert Duncan, Elie Morel, Duke of Edinburgh, and, of course, those very early old favourites, Geant des Batailles, Abbé Brameral, and Souvenir de Charles Montault. Very sweet-scented are some of these old varieties, and the perfume of Baronne Prevost, Caroline de Sansal, and Viscomtesse de Vezins are not surpassed by any others. When one comes across a bed of the older roses many long-forgotten friends are brought to memory. It is instructive to look over an old list and note what were once—and comparatively recently—thought first-class novelties. We scarcely expected such roses then as Florence Edith Coulthwaite, Madame Segond Webber, Madame Constant Soupert, Mrs. W. J. Grant, Molly Sharman Crawford, and Frau Karl Druschki, only to mention half a dozen at random; and yet a good Anna de Diesbach, Madame Vidot, or the exquisitely formed Elisa Boëlle charm us still. We have nothing so intense in colour as Eugène Appert. Grand roses for early use are found in Coupe de Hébé, Charles Lawson, Madame Plantier, and Rugosa Conrad Ferdinand Meyer. The last-named is extra good, and one of our sweetest scented roses, it is difficult to say too much of this variety, but it must not be restricted for room. Frau Karl Druschki is also fairly early upon cutbacks, but the most invaluable point of this purest of white roses lies in its continuing to bloom right up to and past the first frost of autumn.

The rugosas are very early, and here we need have no fear of a blank; whatever the season, their blooms and foliage are unaffected. Then how very sure many of the Chinas are! With such a selection of colour as is now available quite a showy border can be secured, and one that will continue pretty throughout the season. Besides the Old Blush and Old Crimson varieties we should plant the following freely: Comtesse du Cayla, Queen Mab, Cora, Eugène Beauharnais, Laurette Messimy, and Eugène Resal. Many of the dwarf Polyanthas are exceptionally early, and these, like the Chinas, are continuous. Gloire des Polyantha, Aschenbrödel, Flocon de Neige, Canarienvogel, Eugenie Lamesch, Kleiner Alfred, Mignonette, Perle d'Or, and Schneewittchen are among the best. Some of the newer types of this section, such as Maman Norbert Levavasseur, Maman Levavasseur, and Mrs. Cutbush should not be omitted.

A. Piper.

THE PRINCIPLES OF HEREDITY.

(Concluded from page 480.)

◆

Possibilities of Progress.

Professor Bateson, Professor Biffen, Mr. Hurst, and others have lately done much to demonstrate the possibilities of progress in this direction, and the value which the application of the Mendelian principles of heredity must have from the economic point of view. We know now that such cereals as wheat and barley obey the Mendelian laws of hybridisation as regards various important characters. So also do horses as regards the colour of their coats, and human beings as regards the colour of their eyes, and in certain other respects. In short, it appears certain that Mendelian principles have a very general application, and the economic value of the knowledge of such principles in the case of organisms which are only propagated sexually must be enormous.

It is true that Professor Hugo de Vries considers that in the case of cereals it is quite unnecessary to resort to hybridisation in order to effect improvements. He considers that all that is necessary is to select individual plants exhibiting the desired characteristics from amongst the numerous varieties which occur naturally, and to propagate by seed from them.

Speaking of the experiments in plant breeding which have been carried on with such remarkable success for many years past at the Swedish Experimental Farm at Svalof, he remarks:

"They confirm the fact that the ordinary cultivated varieties of cereals are by no means pure, but must be considered as mixtures of well-defined types. Moreover, they show that these types are far more numerous than was previously supposed, and include hundreds of forms within each of the now prevailing sorts. . . . The range of variability disclosed by these new studies is simply so wide that it affords all the required material for almost all the selections desirable at present, and will, no doubt, continue to be an inexhaustible source of improvements for a long succession of years. They are founded on the principle of single selections, and the range of application of this method is proved to be so extensive as to make all ideas of repeated or continuous selection simply superfluous. It is even so rich in its productiveness that there is scarcely any room left for other methods of improvement, and especially should all endeavours of winning ameliorated varieties of cereals by means of hybridisation simply be left out of consideration, as compared with the immense number of more easily produced novelties which this method affords." — "Plant Breeding," p. 50.

No doubt much can be done in this way, but it is obviously only applicable in the case of organisms which exhibit a very large number of naturally occurring true-breeding varieties or mutations, and such organisms are, I believe, comparatively uncommon. Moreover, it is difficult to believe that even in the case of cereals the possibilities of improvement can be exhausted by simple selection. Indeed, Professor Biffen's work indicates a much wider prospect, for he has shown, for example, that susceptibility and insusceptibility to that destructive disease in wheat, known as "rust," behave as Mendelian characters, and that it is possible by a very simple process of hybridisation to confer immunity from this disease upon naturally susceptible varieties.

It may be admitted that if you want a suit of clothes it is easier and more convenient to go into a slop shop and trust to chance for a ready-made article which will "do," but the results are hardly likely to be as satisfactory as if you chose your own cloth and then had it made up to suit your own requirements. Nature certainly supplies us with a fine choice of ready-made articles, but you may happen to want something that is not in the shop, and then it is a great thing to be able to select the best possible materials and have what you want made to order.

Lessons to be Learnt.

The great lesson which we have to learn from experiments in the breeding of plants and animals is that the living organism is a composite structure built up of a vast number of minute characters, many of which at any rate are separately represented in the germ-cells from which the organism develops. How this representation is effected we do not at present know, but the evidence points to the existence, probably in the chromatic substance of the germ-cells, of ultra-microscopic material particles which are, in some way, responsible for the transmission of such characters from generation to generation. Moreover, it appears that each particular character of this kind may be either represented or not represented in any one germ-cell, and that in the process of shuffling which takes place in sexual reproduction individual characters may be added or subtracted, or substituted one for another, without affecting the stability of the organism as a whole. The practical importance of these results lies in the fact that it is possible by controlling the mating of male and female, and thus bringing about new combinations of selected characters, to control at the same time the course of evolution itself, and direct the stream of life in chosen channels.

Man's conquest of nature, which began with the control of inanimate forces and gradually spread over the animal and vegetable kingdoms, is now penetrating to the citadel of life itself. The citadel, however, has not yet capitulated. We have still much to learn; above all we want to know the cause of those sudden variations or mutations which occur in nature. We are already able to take advantage of such mutations for the improvement of plants and animals, but we cannot make our own building material; we do not know how such characters arise, and we cannot produce them ourselves.

Manuring for Potatoes.—The advantage of using natural and artificial manures in combination in potato culture receives further confirmation from the experiments that have been conducted at the University College of North Wales, Bangor. According to the official report, good crops were produced by the use of farmyard manure alone, and by artificial fertilisers alone, but the best crops were those produced on land that received a moderate dressing of the former, supplemented by a suitable mixture of the latter. The best results were obtained by manuring with 10 tons of farmyard manure, 100lb. of sulphate of ammonia, 262lb. of superphosphate, and 82lb. of sulphate of potash per acre.

SOME DIFFICULTIES OF PLANT CULTURE.

(Continued from page 454.)

◆

Insect Pests.

The insects most prevalent in hothouses are aphides, scale insects, red spider, root nematodes, slugs, and wood lice.

Nematodes in hothouses are seldom troublesome, except when the potting soil is full of them to begin with, or when the plants have been systematically over-watered, and, in either case, the remedy is obvious. Red spider is often very troublesome, especially when the air of the houses has been kept too dry. This pest is not easily destroyed by common insecticides, snapping their legs, so to speak, at tobacco smoke, and even at the deadly hydrocyanic acid gas, of which they can endure more than the plants. The best remedy is not to let the plants become infested, and the best palliative is frequent douchings with a fine spray of water.

Plant lice are readily held in check by fumigation with tobacco preparations. This, however, must be managed with care, as so many hothouse plants are peculiarly sensitive, and a careless fumigation might do more injury than a dozen generations of aphides.

Scale insects are not so easily killed, and most of them will thrive on tobacco smoke and ordinary sprays. It has been found, however, that hydrocyanic acid gas is very cheap and effective. It is a deadly poison, and must be used with the greatest care. In intelligent hands it is thought to be the coming remedy for this class of pest. There must, however, be considerable experimenting and testing on the part of specialists before it comes into general successful use. Not only does it quickly diffuse through the air, and speedily kill those who breathe it, but it also kills the plants as well as the insect scales if the dose is too strong.

Furthermore, plants are sensitive to hydrocyanic acid gas in very different degrees; a dose which will not harm one plant will kill another. In any given case it must be determined in advance—first, what is the minimum dose for the insect scale, and, second, that this dose will not harm the plants. When these two facts have been ascertained the cubic contents of the house to be fumigated must be accurately computed, and then the proper amount of gas may be liberated, after the house has been closed as tightly as possible; the roof ventilators must be made air-tight.

Among fungicidal treatments may be mentioned sulphur dusting, the use of lime, hot-water treatment, and spraying with copper compounds. Diseases amenable to one or other of these treatments are powdery mildew, club-root disease of cruciferæ, downy mildew and rot of grapes, leaf blight, fruit tree scab, and "damping off" fungi.

One indirect method of treatment is by furnishing the host plant with the best possible conditions for growth, and the parasites with the poorest. To apply these remedial measures properly requires a very considerable amount of knowledge both of the needs of the crop grown and of the history of the parasite. Here is just where many growers fail, and this is why so many glasshouses seem to have been fitted as a special banqueting chamber for insect pests, and for fungi of all sorts. The first thing that the owner of such a house needs is to learn the habit of the parasites, and study the requirements of his plants until he can properly repress the one and cater for the other. Many houses are badly adapted to the requirements of the crops grown in them.

The powdery mildew and disease rot are brought on very largely by chill, due to improper ventilation, and sometimes to excess of watering. Sometimes these troubles are due to the attempt to grow too many kinds of plants in the same house. In such cases the grower generally tries to follow a medium course in the matter of heat, ventilation, and water supply, and in doing so fails to furnish normal conditions for any of his plants.

Certain field and open garden diseases may also be restricted by stimulating the young plants to make the best possible growth, by raising the plants in soil free from the fungus, and not setting them out in the infected ground until they are beyond the receptive stage.

NEW MARGUERITE PINK ALEXANDRA.
A distinct and attractive variety with pink flowers, introduced by Messrs. R. P. Ker and Sons, and shown by them at the York Gala.

Concerning care in the use of animal manure, in selection of seeds and cuttings, and in buying of trees and other plants, necessary reference has been made.

Harpenden. J. J. Willis.

Wistaria multijuga alba.—The admirable illustration of this wistaria on p. 449 recalls a well-flowered specimen of this variety that I saw a week ago in Messrs. R. Veitch's Nurseries, Exeter. There the plant was forming an arch over a path at one of the entrances, and very effective it was, and especially fragrant. I thought it even more so than the sinensis variety.—E. M.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

GENERAL REMARKS.—The occupants of the warm divisions will now be benefited by having a thin permanent shading, either sprayed or put on with a white-wash brush. This will be found of advantage early in the morning and late in the afternoon. The blinds need not be drawn so early, and they may safely be removed much earlier in the day than where no permanent shading is used. The extra light thus obtained is of considerable benefit in assisting growth, and at the same time assists in obtaining harder and more matured growths. In the intermediate and cool house divisions, where the permanent shadings, recommended to be brought into requisition a few weeks ago, have become thin and washed from the recent rains, it will be advisable to renew the stipple either by placing it on what is still remaining, or by cleaning the old material off and renewing it. The latter method gives the best appearance from the inside. The nights are very cold for the time of the year in this district. With the thermometer reaching below the freezing point, it is not safe to take any risks, and therefore ventilation has had to be regulated with discretion at night; but, anticipating more favourable weather, the ventilators should be used at night whenever these opportunities afford. It is even desirable that sufficient artificial heat should be had in the hot-water pipes to permit of ventilation being given. This will be found to diminish any excessive atmospheric moisture, and will assist in preventing damp spotting. With the cold prevailing winds, it is safer to use the lower ventilators, choosing those as a preference on the leeward side of the houses.

CATTLEYA WARSCEWICZI (GIGAS) and its varied forms are now in different stages of growth. As these produce their flowers just before or immediately they mature their growths, the plants should be subjected to somewhat different conditions than that given to those which mature their growths and take a long resting season before they produce their flowers, I regard C. Warscewiczi as the easiest of all the species to grow. It cannot be claimed that all its varieties have the same free-flowering characteristics, although even the shy-blooming varieties are most tractable to cultivation. We find that where the plants are grown suspended in pots and baskets near the roof glass, they bloom much more satisfactorily than when grown on the stage. We also find that only sufficient water is necessary to retain the pseudo-bulbs in a normal state, until the growths have advanced to the stage when the flower sheath can be seen inside the unfolding leaf. When this stage is reached liberal root moisture is supplied until the flowers have been removed, when the moisture is again gradually withheld, and the plants can then be shifted into cooler and more airy positions, where they are assisted to mature their growth, and retarded to some extent from starting into secondary growth. Where secondary growths commence, as they frequently do in the case of early-flowering plants, it is advisable to place them in a hot position, and give every encouragement, to enable the growths to mature before winter is reached.—H. J. Chapman.

STOVE PLANTS.

POINSETTIA PULCHERRIMA.—Attention will now be required by the earliest rooted cuttings of this invaluable winter decorative plant. Lose no time when the cuttings are well rooted to give them a shift into larger pots—6 inches in diameter is the size in which poinsettias appear to the best advantage. Use a compost of three parts good loam, leaf-mould, sand, and a little peat, with wood-ashes added, made moderately firm, over a good, perfect drainage. At all stages of the growth of the poinsettia an excess or an insufficiency of moisture, at the roots or in the atmosphere, is detrimental to progress; and when they are established in the flowering pots, free exposure to the sun should not be denied them. It is not too late even now to strike cuttings, and old plants cut close down after the cuttings have been taken frequently prove useful; where there is an opportunity they may be used for covering the back wall of a plant stove, they being planted in a border.

ACHIMENES.—For summer and early autumn flowering in the conservatory, suspended in baskets or otherwise, the achimenes are possessed of particular charms; the form, diversity, and colour of the flowers and foliage make them interesting objects of culture. When grown in pots, invisible sticks, a few inches high, should be used to support them, and cool treatment given to prolong the flowering season. To add colour and size to the flowers occasional applications of liquid manure should be made. Provide an intermediate temperature when the flowering season is over, and gradually withhold water until the growth dies down, and then keep the roots dry and warm until the close of the resting season.

ANTHURIUM SCHERZERIANUM.—Few plants are more worthy of cultivation for their attractiveness when in bloom, and few flowers are better adapted for cutting purposes than the spathes, and they last in a fresh state for a considerable time. The principal points to consider in their cultivation are abundance of heat and moisture, and liberal root room. A compost composed of fibrous peat, turf, and sphagnum moss, rough charcoal and sharp sand, is especially adapted to their requirements. It should be pressed firm, and occasionally moss should be tied round the base to conduct the roots down to the soil. The plants will be much benefited by frequent applications of liquid manure, and when there is no spathes make free use of the syringe.

RIVINA HUMILIS.—The chief charm of this plant is derived from the long racemes of bright scarlet berries. When well grown it is effective and interesting. It is readily raised from seed, and seedlings can generally be found near to the position the plants occupied when in fruit. They grow freely in a compost of equal parts loam, leaf-soil, and sand. Keep them from becoming dry when once the berries are formed, otherwise they may drop.

COLEUSES.—The various forms in which these plants can be grown, together with their varied and bright foliage, render them of much value for summer decoration; but to secure good foliage and retain it for any length of time, when once the pots are full of roots they must be freely and frequently fed, and carefully hardened if removed to cooler quarters.—W. Fyfe, Lockinge Park Gardens.

THE KITCHEN GARDEN.

FRENCH BEANS.—Where the early potatoes have been lifted from sheltered borders, both the soil and situation will be excellent for the sowing of French beans for giving a late supply. They can here be protected by placing cold frames over the plants before destructive frosts arrive, thus often warding off damage well into the month of November. A compact growing variety, such as Little Prince, Sutton's Forcing, or the old but good Osborn's Dwarf Prolific, are the most suitable kinds to sow for this purpose. Rows may be placed about 18 inches apart. Should the weather be dry, water the drills before sowing the seed.

WINTER BROCCOLI, ETC.—Make every endeavour to plant out and secure the necessary stock of winter greens in their permanent quarters as ground becomes vacant from previous crops. Old strawberry beds, after removing the plants, and without further preparation, are desirable sites for winter broccoli. The soil being firm and rich, hard and satisfactory growth invariably follows that will stand the winter frosts unless extra severe. This is hardly less important with other winter greens. Do not allow a check to the plants more than can be prevented in transplanting, by carefully retaining the roots and giving a sufficient watering to settle the soil. When firmly established frequent stirrings of the surface soil, either by hoeings or light forkings, will greatly assist the progress of growth.

PARSLEY.—An important sowing of seed of this herb should be made at or about this date with the view of providing a stock to furnish the winter and spring supplies. The young plants are to be planted in sheltered positions and in cold frames and pits. Choose a sweet and rich soil, and give a dressing of soot to act as a prevention, to some extent, against wireworm. When sowing the seeds see that the bed is charged with moisture sufficient to ensure germination, or it may be dormant for a long time.

MUSHROOMS.—Collect manure for the beds to crop through the autumn and early winter months. Preparation in fermenting it should be carried out in a shed or under a north wall. Frequently turn and evenly shake out every particle to ensure its being fermented. The ridge method is perhaps the best for making the beds outside at this season, but in any case the beds should be so formed as to throw off heavy rains that are likely to come in October.

CHICORY.—In several cases I have seen the seeds have germinated unevenly this season. Young plants may be thinned where they are too thickly together, and planted in the vacant places, and showery weather should be selected for carrying this out. Water should be given in quantity until root action commences in the new soil. It is not too late to make another sowing in cases of total failure.

GENERAL REMARKS.—Tomatoes will now be making much growth. Do not allow this to exclude light, but promptly remove side shoots to give full exposure to the flower trusses and fruit. Under dry walls it may be necessary to give water. From now to the end of July at least such plants as peas, runner beans, vegetable marrows, and celery, etc., will be much benefited if a good syringing during the afternoon can be given them on hot days. Care, especially on light land, is essential in seeing that such plants do not suffer from dryness at the roots. In this part of the country we have suffered from want of rain to an unusual extent, attended with dry, cutting winds, that has kept vegetation very backward.—Chas. Flack, Cholmondeley Castle Gardens.

FRUITS UNDER CLASS.

MUSCAT HOUSE.—Muscat grapes are now stoning, and during this period it is well to keep the temperature as even as possible, and in dull weather it must be kept up by fire heat; 70 degrees will be high enough. Examine the bunches very carefully, and thin a little where there is pressure on the berries. This should be done by skilled hands. From this date cease syringing, excepting perhaps after a very hot day, when one may direct a little spray between the bunches, though the water must not be allowed to touch the bunches, or the natural bloom will be tarnished. We find it very necessary after dull spells to sprinkle a little shading on the glass, as we are exposed to fierce sunshine. As soon as the stoning process is finished, which will be detected by the berries swelling away quickly, the borders should receive a thorough watering, using some manure at the same time, and thoroughly well washing it on to the roots; on shallow and well-drained borders this will need repeating about every ten days, more or less, according to the weather.

LATE PEACHES AND NECTARINES.—Remove all fruits that are not necessary; I have known fruits left on until after the stoning period, with the idea that many would probably drop, but all fruits not required should be removed before that period, for it is at that time vigour is necessary. Remember that heavy cropping one year may possibly lead to a poor crop the next. Keep the growth nicely tied in, training it up straight and evenly exactly where it is required; do not allow the borders to become dry upon any consideration; syringe the foliage twice daily, and give a good sprinkling of soot water, which is a good healthy cleanser, and a check to thrip.

EARLY STRAWBERRIES.—Those planted out in south borders with frames over them are fruiting finely, and providing good dishes. Preparations should be made for a like border for another season, and it should be deeply dug and manured, and the strawberries planted so that the frames will cover them.

TIDYING UP THE HOUSES.—It is a good plan to examine all crevices and corners for cobwebs on a wet day. All doors, locks, hinges, ventilators, etc., should also be looked over and carefully oiled. If this is done occasionally the locks and fastenings are kept in good working condition, and last much longer. Where cobwebs are allowed in vineries they are apt to get into the bunches of grapes, and are sometimes then difficult to dislodge without rubbing the bloom off the berries.—W. A. Cook, Leonardslee Gardens, Horsham.

New South Wales Plants.—The cultivation of native plants receives a full share of attention in Sydney Botanic Gardens, and the lesser-known forms of promise are added to the collection from time to time. In his annual report Mr. J. H. Maiden writes appreciatively of Tylophora grandiflora, an asclepiad of scandent habit that is found in the bush in the northern parts of the country. Also of Pherosphaera Fitzgeraldi, a distinct conifer from the Blue Mountains, which is found in the moist gorges in association with the todeas and other filmy ferns.

THE GREAT ROSE SHOW
OF THE YEAR
will be held by the NATIONAL ROSE SOCIETY
in the
ROYAL BOTANIC GARDENS,
REGENT'S PARK, N.W.,
ON FRIDAY NEXT, JULY 2nd.

THE TWO CHAMPION CHALLENGE TROPHIES
WILL BE COMPETED FOR.

Also numerous other Cups and Pieces of Plate, and
Money Prizes, to the value of
£400.

TWO MILITARY BANDS.

Luncheons, Teas, and other light Refreshments.

ADMISSION—Noon to Three p.m., 5s.; Three to Five
p.m., 2s. 6d.; Five to Seven p.m., 1s.

E. MAWLEY, Hon. Sec., Rosebank, Berkhamsted.

Exhibitors should at once send in their entries.

BATH GRAND ROSE SHOW and
GENERAL SUMMER EXHIBITION.
SYDNEY GARDENS,
WEDNESDAY and THURSDAY, July 7 and 8.

Classes for Roses, Nurserymen and Amateurs.
Bouquets, Cut Flowers, Sweet Peas, Strawberries,
Plants, and Tuberous Begonias.
Entries close July 2nd.

For prize schedules, etc., apply,
B. R. F. PEARSON, Sec.
Office, 17, Argyle Street, Bath.

BECKENHAM HORTICULTURAL
SOCIETY GRAND SUMMER SHOW (open)
WEDNESDAY, July 14. Floral Fête; numerous attractions. Two Military Bands.
T. W. THORNTON, Hon. Sec.
The Library, Beckenham.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY COMING OF AGE SHOW.
SOPHIA GARDENS, CARDIFF,
WEDNESDAY and THURSDAY, July 21st and 22nd,
1909.
Most liberal prizes for this show.
MONEY, PLATE, etc., Amounting to about £400.
Many special features this year.
Schedules free to any address.
Mr. A. MAURICE BAILEY, Secretary.
24, Duke Street, Cardiff.

HANLEY PARK, STAFFORDSHIRE.
July 7th and 8th, 1909.

THIRTEENTH GREAT
ANNUAL FLORAL FETE.
£650 in Prizes. Silver Cups, Gold and Silver
Medals.
SILVER CHALLENGE CUP, VALUE £10 10s.
offered for TRADE EXHIBIT (for particulars, see
page 10 in Schedule).
Valuable Special Prizes offered by the principal firms
in England.
The Railway Companies will convey Exhibits at one
fare for the double journey, provided they remain
the property of the Exhibitors.

Schedules post free on application to—
WM. POULSON, Secretary.
Town Hall, Hanley.

PORTSMOUTH HORTICULTURAL
SOCIETY—SUMMER SHOW Sweet Peas, Roses,
and Carnations, to be held on the SOUTH PARADE,
[illegible] TUESDAY and WEDNESDAY, July [illegible] and
[illegible] All communications to the Secretary,
[illegible] GILL, "St. Mark's," Florence Road, Southsea.

RICHMOND HORTICULTURAL
SOCIETY.
THE THIRTY-FIFTH GRAND ANNUAL SHOW
will be held in
THE OLD DEER PARK, RICHMOND,
On WEDNESDAY NEXT.
Valuable Money Prizes. Silver Challenge Cups for
Roses and Fruit.
W. J. COOK, Hon Sec.
[illegible]y House, Richmond, Surrey.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

The exhibits staged on June 22 were not so crowded as those at the more recent gatherings, and the annexes were available for the committees, and for visitors to rest in. Hardy flowers were the great feature of the show, and pæonies were shown in enormous numbers.

FLORAL COMMITTEE.

A very large and brilliant display of hardy flowers was made by Messrs. George Bunyard and Co., Maidstone, who filled two tables with a fine selection of herbaceous pæonies, the flowers all bright and clean, the cream-coloured Duchess de Nemours standing out as a specially fine and sweet-scented variety. Heucheras, irises, oriental and Iceland poppies, pyrethrums, and campanulas were also very beautiful and well staged. Spanish irises were largely shown by Messrs. William Bull and Sons, Chelsea, the firm setting up large bunches of such lovely varieties as Ophir, Hercules, Solfatara, Flora, Giant, King of the Blues, Darling, Bronze King, Leander, Belle Chinoise, and St. James—a very bright exhibit of these popular and useful flowers.

The display made by Messrs. H. B. May and Sons, Edmonton, consisted of a selection of double, single, and cactus flowered zonal pelargoniums represented by big bunches of cut blooms, and also a collection of nephrolepises that proved very interesting in view of the great increase of varieties in recent years; all the novelties were shown.

Mr. W. A. Cook, gardener to Sir Edmund Loder, Bart., Leonardslee, Horsham, contributed an exhibit of outdoor flowers that contained fine examples of Sarracenia purpurea, dianthuses, Rhododendron fragrans, R. arbutifolia, Styrax obassia, Magnolia Watsoni, Rose Una, Rosa rugosa fimbriata, Fremontia californica, Benthamia fragifera, and the elegant Philadelphus Falconeri. Pæonies were beautifully shown by Messrs. Kelway and Son, Langport, Somerset, and among the many splendid varieties staged we selected A. W. Hayward, Lord Avebury, Miss Brice, Sir Richard Seddon, Kelway's Queen, Kitty Green, Sir George White, and the singles Lord Curzon and Her Grace as being of special merit. The Langport firm also sent a fine lot of double and single pyrethrums. Mr. Clarence Elliott, Six Hills Nursery, Stevenage, sent pans of edelweiss, Aster alpinus, Arnebia echioides, Delphinium cardinale, and many charming dianthuses and other alpines. From the Guildford Hardy Plant Company, Guildford, came a varied set of alpine and herbaceous plants.

A very interesting exhibit was the extensive one of pinks, in pots, shown by Mr. James Douglas, Great Bookham, Surrey. This was a lovely exhibit and of great educational value. Conspicuously good were the white Snowdrift, the red-edged Amy, Mrs. Pomeroy, the red Rubicon, Adonis, The Duke, Ascot, Morna, and Phyllis, all very charming in form and colour, and very free blooming. Messrs. G. and A. Clark, Dover, brought up a large display of hardy flowers, and among their many useful and beautiful subjects we noted Geum coccineum, Mrs. J. Bradshaw, Anthericum liliastrum major, Incarvillea Delavayi, Inula glandulosa, pæonies, and bunches of Evelyn Hemus, Parisian Belle, Etta Dyke, Norma, The Marquis, Helen Lewis, and other charming sweet peas.

Sterling Stent, a fine new white perpetual carnation, was splendidly shown by Mr. A. A. Fabius, Redlands Nurseries, Emsworth. This has large solid blooms that have a good calyx and are clove-scented. Messrs. T. S. Ware, Lim., Feltham, arranged a little rock garden, and also set up a magnificent bank of finely grown flowers of herbaceous subjects. At the back were stately eremurus spikes, and in front of these were fine pæonies, and big sheaves of the lovely Persimmon delphinium, Campanula latifolia, C. persicifolia, Dictamnus fraxinella alba, Hemerocallis Lemon Queen, etc. Garden roses were prettily shown by Messrs. Paul and Son, The Old Nurseries, Cheshunt, the blooms of Lady Battersea, Ards Pillar, Marquise de Sinety, Madame Pernet, Gustave Regis, J. B. Clark, Prince de Bulgarie, Madame Ravary, and Mrs. Peter Blair being well set up in big bunches.

Messrs. Frank Cant and Co., Colchester, set up bunches of lovely flowers of Lady Battersea, Madame Melanie Soupert, Irish Glory, Gustave Regis, Irene Walis, Mrs. S. Treseder, and Lady Wenlock, as well as oher useful garden varieties. A bold group of German irises, pæonies, and pyrethrums was contributed by Mr. A. J. Harwood, St. Peter's Nursery, Colchester. Herbaceous pæonies were well shown by Messrs. R. H. Bath, Lim., Wisbech, and among their many excellent varieties we were especially attracted by Nymph, a lovely white single with a great big centre of yellow petaloid stamens—a splendid pæony.

Sweet peas were delightfully well shown by Mr. W. J. Unwin, Histon, Cambridge, who set up grand bunches of fine blooms of Nancy Perkins, Constance Oliver, Nora Unwin, Mistress Lumley, Clara Curtis, Cambridge Pink, Histon Favourite, Evelyn Hemus, and Frank Unwin. Mr. C. Blick, Warren Nurseries, Hayes, showed several very fine carnations, the finest being Lady Hermione, Sarah Bernhardt (A.M.), and Calypso, the two latter being Malmaison varieties. The fragrant-leaved pelargonium Clorinda was again finely shown by Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, who had ten grandly grown standard specimens, each with a head 3ft. to 4ft. through. Mr. Beckett also staged a very comprehensive collection of pelargonium species and hybrids.

Eremuri were very largely shown by Messrs. William Cutbush and Son, Highgate, this firm setting up several dozen spikes of E. robustus over a groundwork of blue campanulas. This group was flanked with pæonies, and in the foreground were liliums and big pools of Marliac's water lilies, Delphinum Moerheimi. Messrs. J. Peed and Son, West Norwood, again sent a selection of alpines and succulents and Japanese maples. Mr. Maurice Prichard's exhibit was chiefly of pæonies, and the beautiful Anchusa italica Dropmore variety. Mr. Charles Turner, Slough, showed a charming series of single pæonies, including Queen of Singles (A.M.), a pure white with a central boss of golden stamens. Besides their roses, Messrs. Paul and Son, Cheshunt, had a group of pæonies, dictamnus, and carnations. Messrs. Mawson Brothers, Windermere, contributed a big batch of grand flowers of a lovely salmon-pink Oriental poppy named Jeannie Mawson. Long-spurred columbines were largely and well shown by Messrs. Bakers, Codsall, Wolverhampton.

Mr. R. C. Notcutt, Woodbridge, displayed poppies, Spanish irises, pæonies, and other useful hardy flowers. Mr. G. Reuthe, Keston, set up eremuri, poppies, pyrethrums, lychnis, saxifrages, irises, hardy cypripediums, Rhododendron cinnabarinum, and other choice subjects. Messrs. E. W. King and Co., Coggeshall, had a very beautiful display of fine sweet peas, and the central feature of the exhibit was a bunch of the bright Stirling Stent (A.M.) (raised by Mr. Agate, of Havant), a bright orange-salmon variety of great beauty; other good things were Marjorie Willis, Evelyn Hemus, Helen Lewis, Jeannie Gordon, Constance Oliver, and Lord Nelson.

Some glorious roses were submitted by Messrs. Ben. Cant and Sons, Colchester, their finest being Maharajah, Gottfried Keller, Papa Gontier, Lucy Carnegie, Mrs. B. R. Cant, Warrior, and Irish Glory. Very bright were the long-spurred columbines, admirably shown in goodly bunches by Messrs. H. Cannell and Sons, Swanley. Pink lupins and a collection of herbaceous flowers and flowering and ornamental shrubs came from Messrs. J. Cheal and Sons, Crawley. Fine pæonies, liliums, irises, poppies, and columbines were all staged in quantity by Messrs. G. Jackman and Son, Woking. Mr. Amos Perry, Enfield, had a bold display of irises, hemerocallis, Pæony Mrs. Perry, Lilium davuricum, Aster sub-cæruleus, and a delightful series of the very elegant heucheras.

Messrs. James Veitch and Sons, Chelsea, showed cut trusses of specially good rhododendrons, the velvety Rosa Moyesi, pots of Nemesia Blue Gem, Cardinal candytufts, Alonzoa Warscewiczi, Calceolaria Clibrani, Lobelia tenuior, various new cannas, Hydrangea hortensia Veitchi, and the glowing Kalanchoe flammea. Violas were delightfully set up by Mr. Howard H. Crane, Highgate, who arranged bowls of a variety; Mrs. Chichester, Sultan, Kitty Bell, Swan, Cream King, Mrs. E. M. Cann (golden-yellow), Royal Blue, and James Pilling were a few of the best.

Particularly fine on this occasion were the carnations shown by Mr. H. Burnett, Guernsey, who had a fine group of splendid blooms of Marmion, Bridesmaid, Enchantress, Afterglow, Mrs. H. Burnett, Mikado, Fortuna, Beacon, Winsor, and the very showy Vulcan. This was an even finer group than Mr. Burnett had at the Temple Show, and it was greatly admired. The exhibit arranged by Messrs. Barr and Sons, Covent Garden, consisted of a big display of irises and pæonies, the latter occupying a very large space, and making a brave show.

ORCHID COMMITTEE.

Mr. Ballantine, gardener to Baron Schroder, The Dell, Egham, showed the very handsome Odontoglossum Black Prince, carrying a grand spike of a dozen big blooms, the flowers rich chocolate-brown, edged with rosy blush, and with golden disk. Mr. Black, gardener to R. G. Thwaites, Esq., Streatham, sent up a beautiful white ground O. crispum named Majestica. Mr. Mertens, Mont St. Amand, Ghent, brought over some exquisite odontoglossums, and a scarlet odontioda.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, put up an effective group of orchids that contained good odontoglossums, Epidendrum prismatocarpum, Miltonia vexillaria, Chysis bractescens, Epidendrum vitellinum majus, and numerous cattleyas and an assortment of quaint botanical orchids.

Mr. A. W. Jensen, Lindfield, sent some excellent forms of Cattleya Mendeli and C. gigas. From Southgate Messrs. Stanley and Co., brought up a fine lot of beautiful varieties of Cattleya Mossiæ, C. Mendeli, C. Gaskelliana, several oncidiums, and Miltonia vexillaria Cobbiana, the latter with very big bold flowers.

FRUIT AND VEGETABLE COMMITTEE.

A grand lot of cabbage lettuces came from Messrs. Jas. Veitch and Sons, Chelsea, representing a wonderful range of form and even of colour; Passion, All-the-Year-Round, Imperial, Perpignan Improved, Continuity, New York, and Palatine, were all excellent varieties. Veitch's forcing cauliflower, from seed sown January 2, were beautiful white heads.

In the competition for three dishes of tomatoes, distinct, Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, was easily first with splendid fruits of Perfection, Golden Perfection, and Sutton's A1; Mr. H. C. Gardner, gardener to Lord Foley, Ruxley Lodge, Esher, second with Hippur No. 1, Veitch's Dwarf Red, and Winter Beauty; Mr. J. Vert, gardener to Lord Howard de Walden, Audley End, Saffron Walden, third.

AWARDS.

There were no first-class certificates granted on this occasion.

Award of Merit. — To Delphinium Moerheimi and Aster Mesa grandiflora, from Messrs. W. Cutbush and Son, Highgate; to pæonies Leonora and Queen of Singles, from Mr. Chas. Turner, Slough; to Carnation Her Majesty, from Mr. C. Blick, Hayes; to Campanula phyllidocalyx, from Mr. Bain, gardener to Sir Trevor Lawrence, Bart., Dorking; to Sweet Pea Stirling Stent, from Mr. J. Agate, Havant, and Sweet Pea Blanche Stevens, from Mr. H. J. Jones, Lewisham.

MEDALS.

Silver-Gilt Flora.—To Messrs. G. Bunyard and Co., Maidstone, for hardy flowers; to Messrs. H. B. May and Sons, Edmonton, for flowering plants and ferns.

Silver-Gilt Banksian. — To Messrs. Wm. Cutbush and Son, Highgate, for hardy flowers; to Messrs. J. Veitch and Sons, Chelsea, for flowering plants; to Messrs. T. S. Ware, Feltham, for hardy flowers.

Silver Banksian. — To Mr. E. Beckett, V.M.H., Aldenham House Gardens, for pelargoniums; Mr. H. Burnett, Guernsey, for carnations; Messrs. B. R. Cant and Sons, Colchester, for roses; Messrs. E. Jackman and Son, Woking, for hardy flowers; to Messrs. E. W. King and Co., Coggeshall, for sweet peas; to Mr. R. C. Notcutt, Woodbridge, for hardy flowers; to Mr. M. Prichard, Christchurch, for hardy flowers; to Mr. G. Reuthe, Keston, for hardy plants; to Mr. W. J. Unwin, Histon, Cambridge, for sweet peas; to Mr. W. A. Cook, Leonardslee Gardens, for hardy flowers; to Messrs. Stanley and Co., Southgate, for orchids; to Mr. A. Jansen, Lindfield, for orchids.

Silver Flora.—To Messrs. Stuart Low and Co., Bush Hill Park, Enfield, for orchids; to Messrs. R. H. Bath, Lim., Wisbech, for pæonies, etc.; to Messrs. H. Cannell and Sons, Swanley, for aquilegias; to Messrs. F. Cant and Co., Colchester, for roses; to Messrs. G. and A. Clark, Dover, for hardy flowers; to Messrs. Kelway and Son, Langport, for pæonies, etc.; to Messrs. Paul and Son, Cheshunt, for roses and hardy flowers; and to Mr. Amos Perry, Enfield, for hardy flowers.

SCIENTIFIC COMMITTEE, June 8.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair), Sir J. T. D. Llewelyn, Prof. G. S. Boulger, Messrs. W. E. Ledger, R. A. Rolfe, W. Hales, J. Fraser, L. Crawshay, G. Gordon, R. Hooper Pearson, J. Douglas, W. Fawcett, G. S. Saunders, H. T. Güssow, J. T. Bennett-Poë, E. M. Holmes, A. W. Hill, J. S. Arkwright, and F. J. Chittenden (hon. secretary).

IMPATIENS x COMORICOMA. — The award of a certificate of appreciation was unanimously recommended to Messrs. Cayeux in acknowledgment of work done in raising the hybrid impatiens shown at the last meeting, and the careful notes thereon contained in the "Rev. Hort."

HYBRID DIANTHUS.—Mr. Douglas exhibited flowers of hybrid dianthus. One had been raised by crossing Dianthus barbatus with a double pink (D. plumarius). This had rather glaucous foliage, leaves about ¾in. broad, and pink flowers with about a dozen petals laciniated at the margins, borne on branched stems carrying about eight or ten flowers. The second was the hybrid between D. barbatus and D. caryophyllus var. Uriah Pike, known as Lady Dixon, a form which never produces seeds, but flowers very profusely.

VARIEGATED LAUREL. — Mr. Crawshay showed foliage of a much variegated form of the common laurel, Prunus laurocerasus, the bush from which this was cut was an old one, and the variegation had proved constant.

ALPINE PLANTS. — Mr. J. Fraser, F.L.S., showed cultivated specimens of a very dwarf form of Salix herbacea, which he had collected at an elevation of 3,984ft. on Ben Lawers. The height to which it attained in the wind-swept situation in which it was growing was only from ¼in. to ½in. He also showed Draba rupestris from the same locality, and Tofieldia palustris from an altitude of 2,800ft. in Perthshire with fruit. These had all been grown in pots, and were somewhat taller than when collected. Mr. Fraser also showed flowers of Rosa spinosissima, which is still found growing wild within the county of London, though it does not now fruit. The flowers exhibited were very small, and had been picked from the wild specimen alluded to.

LONICERA STANDISHI. — Mr. E. M. Holmes exhibited ripe fruit of this lonicera, which rarely fruits in Britain.

AQUILEGIA DOUBLE. — Mr. Hales drew attention to the doubling of aquilegias where, somewhat as in the hose-in-hose primrose, the petals are packed one within the other. Mr. Chittenden pointed out that the additional petals were modified stamens, of which the filament became the claw of the petal, while the spur and the limb of the petal were developed from the anther; in specimens in which the modification had not gone far the two anther lobes could be seen around the mouth of the spur.

MALFORMED ORCHID.—Mr. Rolfe exhibited an odontoglossum in which the petals had acquired somewhat the colouration of the lip.

PRIMROSES FLOWERING.—Mr. A. W. Hill said that there was at present flowering at Kew a common primrose, which had been brought from Shetland last year, and had thus retained its normal time of flowering.

TRACHYCARPUS EXCELSUS MONŒCIOUS.—Mr. Bowles exhibited an inflorescence of Trachycarpus excelsus, and remarked that although most of the flowers were staminate in the inflorescence for some years, a few pistillate flowers had developed and had produced fruit. This was most evident in the inflorescences which had developed late in the season.

National Vegetable Society.

A meeting of this newly-constituted society was held at the Hotel Windsor, Westminster, on Tuesday last, with Mr. Alex. Dean, V.M.H., in the chair, when the details of organisation were practically completed.

It was reported that His Grace the Duke of Portland had accepted the invitation to become the president of the society, and had promised to give it his heartiest support. It was further reported that the following gentlemen and firms have become vice-presidents, namely: The Rt. Hon. Earl of Carrington, the Hon. Vicary Gibbs, M.P., Messrs. G. Bunyard, V.M.H., J. Basham, R. Barr, H. Cannell, J. Cheal, Wm. Cuthbertson, J.P., J. Collingridge, J. Ha Ed. Hudson, W. G. Lobjoit, C. G. A. Nix, A. H. Pearson, J. Poupart, N. N. Sherwood, A. Sutton, V.M.H., Robert Sydenham, D. W. Thomson, H. J. Veitch, V.M.H., J. C. Veitch, J.P., A. Watkins, J. Wright, V.M.H., J. Carter and Co., Daniels Bros., Dicksons, Lim., Alex. Dickson and Sons, Lim., Dickson, Brown, and Tait, Dickson and Robinson, Fidler and Son, Fisher, Son, and Sibray, Hogg and Robertson, Johnson, Lim., R. P. Ker and Sons, E. W. King and Co., John K. King and Sons, Rogers and Sons, C. Sharp and Co., Toogood and Sons.

EXECUTIVE COMMITTEE.

The Executive Committee as at present constituted is as follows: Messrs. B. Ashton, N. Barnes, E. Beckett, V.M.H., E. T. Cook, W. A. Cook, A. Dean, V.M.H., C. Foster, J. Gibson, George Gordon, V.M.H., F. W. Harvey, G. Hobday, R. Hooper Pearson, J. Harrison Dick, J. Jaques, J. Lyne, H. Markham, S. Mortimer, W. Poupart, R. J. Steel, Owen Thomas, V.M.H., J. Vert. It was decided to invite two or three other well-known authorities on vegetables to join this body. Mr. G. Wythes, V.M.H., Hopefield House, Windmill Road, Brentford, is the treasurer, and Mr. E. G. Quick, Harrow View, Wealdstone, Harrow, the hon. secretary.

The question of proceeding with the trials of certain kinds of vegetables was considered.

and the arrangements connected therewith advanced a stage.

The following are the object and rules of the society:

OBJECTS AND RULES OF THE SOCIETY.

1.—The title of this society shall be the National Vegetable Society, and its object shall be to promote the wider cultivation of vegetables as food products, to encourage their consumption as food, to promote exhibitions of such products, whether competitive or otherwise, and to hold trials under such conditions as may offer with a view to finding the best varieties to commend for general culture, and to ascertain commercial values when grown under ordinary conditions.

2.—Membership shall be open to all persons who will pay an annual subscription of not less than 5s., and who are in entire agreement with the objects above stated.

3.—Executive Body.—The governing body of the society shall be a president, vice-presidents, treasurer, and secretary, who together with an executive committee not exceeding 24 members shall be elected annually.

4.—Annual Meeting.—An annual general meeting of all members shall be held in the month of January each year, when the report of the committee's work for the previous year shall be read, and a duly audited balance-sheet of accounts presented. The annual election of officers and committee shall also then be held. Two auditors shall be elected at such meetings.

5.—Meetings of the Committee shall be convened by the secretary from time to time as the business of the society may require, as the committee itself shall determine, or on the request of any four members of the committee, such request to be made in writing to the secretary. The committee shall elect its own chairman and vice-chairman at its first meeting immediately following the annual general meeting.

6.—Subscriptions become due on the first day of the month of January in each year, and should be paid through the treasurer, who shall forward an official receipt to the member for same at the earliest possible date. All cheques shall be made payable to the National Vegetable Society.

7.—All members will be entitled to vote at the general meetings, and also be eligible for election on the executive committee. Members will also be entitled to receive copies of any reports or publication issued by the society, and to exhibit at any show or in any classes arranged by the society.

8.—All trials conducted by the society shall be thoroughly impartial and designed to elicit useful information. They shall be under the control of a Special Trial Sub-Committee of not less than three members, who shall be responsible to the General Committee.

British Gardeners' Association.

At the last meeting of this association the new Executive Council for 1909 met for the first time. Mr. Geo. Hemming was elected chairman for the ensuing year, and Mr. John H. Witty, vice-chairman. The question of editing and enlarging the journal of the association was considered, but no decision was arrived at, pending further information in regard to the financial aspect. It was decided by a majority that the monthly meetings be held on Tuesdays at four p.m. The secretary was instructed to prepare a form and draft a letter to be sent out, inviting the attention of those wishing to become hon. members. It was also decided to obtain samples and specimens of a badge. Seventeen new members were elected, bringing the total up to 1,517.

Royal Agricultural Society, Gloucester.

The horticultural section of the "Royal," which was opened to the public on Wednesday, June 23, and continued open until Saturday, must be proclaimed the best flower show ever held in conjunction with this society. The large, roomy tents were filled to overflowing with plants, flowers, and fruits of the very highest quality, and the management was so excellent that Mr. Peter Blair, who was at the helm, deserved and received unstinted praise. The following report, condensed to meet the limits of our space, cannot do full justice to the grand display, but will give our readers some idea of what good things were to be seen at Gloucester.

A deputation from the Royal Horticultural Society visited the exhibition and made many awards.

COMPETITIVE EXHIBITS.

In the leading class for a group of plants occupying 350 square feet, the first prize, £30, was ably won by Messrs. J. Cypher and Sons, Cheltenham, who had a fine lot of both flowering and foliage plants arranged in very artistic style. Crotons stood above a bed of orchids, ferns, and other plants, with pillar roses, liliums, and tall palms in the background. Second place was secured by Mr. W. A. Holmes, West End Nurseries, Chesterfield, with another very pleasing group similar in general character, but which lacked something in point of refined lightness. Mr. Curtis, gardener to J. S. Blacker, Esq., Thorpe Villas, Selby, was placed third, a sign of weakness being apparent in the group mainly through too much white and green variegation; fourth, Mr. Jos. S. Sharp, Bankfoot, Aldmondbury; fifth, Mr. William Vause, Leamington. Messrs. Cypher and Sons were the only exhibitors in the class for a collection of orchids, and worthily received first prize. Conspicuous was a seedling which, although no expert present would venture to name it, attracted a great deal of attention.

For a collection of stove and greenhouse plants, the Messrs. Cypher were again victorious with their well-known specimen plants so often reported upon. Messrs. Blackmore and Langdon won first prize for a group of begonias which were absolutely grand. Colour, form, size, were all combined in every plant on the stand. Only one entry was made for the amateurs' group (200ft), confined to the County of Gloucester. This was from Mr. Charles Savegar, gardener to the Right Hon. Sir John Dorington, Bart., Lypiatt Park, Stroud. The main features of the group were orchids and some fine crimson amaryllis, set off by crotons, palms, etc. The arrangement was good.

For a group of carnations in pots, occupying 100 square feet, first prize and gold medal was won by Mr. R. Tooley, gardener to Hugh Andrews, Esq., Toddington, Winchcombe, Glos. Malmaison varieties were largely used with perpetuals towards the back; second, Mr. N. Langton, Hugglecote Nurseries, Gloucester, with nicely-flowered plants which might have been better staged; third, Messrs. Heath and Son, College Nurseries, Cheltenham. Here, again, the arrangement was disappointing.

For a collection of hardy cut flowers and plants arranged on the ground (200 square feet), Messrs. G. Gibson and Co., Leeming Bar, Bedale, were first, no other competitor coming forward. This is a class which offers great possibilities, and certainly deserves support.

Mr. C. F. Waters, Deanland Nursery, Balcombe, Sussex, ably won first prize for a collection of carnations (cut) occupying 12ft. by 5ft. For variety, quality, and tasteful arrangement, this exhibit was worthy of high praise. Messrs. Bell and Sheldon, Castel Nursery, Guernsey, were a good second; Mr. A. F. Dutton, Iver, Bucks, third.

Messrs. Geo. Mount and Sons, Lim., Canterbury, led well in the collection of roses occupying 15ft. by 5ft. Frau Karl Druschki, Richmond, Mrs. J. Laing, and other popular roses were used in Messrs. Mount's masterly manner, tall ramblers filling up the background; second prize was secured by Messrs. W. and J. Brown, Stamford, with a very nice display; third, Mr. Geo. Prince, Longworth, Berks, who wanted a few bolder flowers to give weight to his exhibit; fourth, Mr. E. J. Hicks, Twyford, Berks; fifth, Messrs. Cooling and Sons, Bath.

Very keen was the competition in the hardy perennial class; Mr. M. Prichard, Christchurch, Hants, securing the coveted award with a beautiful collection of pæonies, delphiniums, and other choice things. Messrs. J. Harkness and Sons, Bedale, followed closely with a massive bank of brilliant flowers. Messrs. G. Gibson and Co. third.

The class for a collection of sweet peas, arranged for effect on a space of 20ft. by 5ft., brought four entries, all of which were of a high order of merit. The first prize and gold medal was awarded to Mr. E. Usher, gardener to Sir R. Baker, Bart., Ranston, Blandford, who had lightly arranged bunches arranged on a tiered stage, with tall pyramidal arrangements at intervals to break the level; second position was won by Mr. C. W. Breadmore, Winchester, who also staged grand flowers in an elegant and pleasing manner; third, Mr. W. J. Godfrey, Exmouth; fourth, Mr. T. W. Darlington, Warton, Carnforth.

NON-COMPETITIVE EXHIBITS.

These played a notable part in making the show the remarkable success it was. The group of orchids put up by Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, was a really glorious exhibit, in which tasteful grouping was as noteworthy as the excellence of individual varieties, and the skilful cultivation of every specimen. Lieut.-Colonel Holford's exhibit of orchids was recommended for the Lawrence Medal by the Deputation of the R.H.S. The group occupied about 300 square feet, and teemed with rare and choice hybrids chiefly raised at Westonbirt. The centre was occupied by Lælio-Cattleya Canhamiana and L.-c. Aphrodite, L.-c. Tyntesfieldiense, C. Mossiæ, and C. M. Wagneri, C. M. Reineckiana Westonbirt var., L.-c. Countess Grey, C. gigas, C. Warneri, and miltonias in fine specimens, bearing an average of 100 flowers each. Vanda teres and some grand odontoglossums were on either side of the group. O. Othello, a very fine hybrid, was conspicuous. Brassocattleyas were well represented by nearly all the leading varieties, and a clear note of colour was provided by the golden flowers of Dendrobium suavissimum. Phalænopsis Rimestadiana, Cochlioda Noetzliana, Cypripedium barbatum, C. callosum Sanderæ, C. Maudæ, and other summer-flowering varieties were also finely represented. The foregoing and many other grand things helped to make up a magnificent exhibit.

The extensive group of amaryllis from the same gardens, set up by Mr. Chapman, the head gardener, was very fine.

Messrs. Dobbie and Co., Rothesay, put up a big bank of aquilegias, sweet peas, pansies, and violas, all of first-rate quality.

Messrs. W. and J. Brown, Stamford, staged hardy flowers, conspicuous among which were fine eremuri, liliums, and the new pyrethrum White Perfection.

Mr. J. H. White, Worcester, showed a large variety of herbaceous flowers, and a few greenhouse plants, Calla Elliottiana being specially noticeable.

Messrs. Toogood and Sons, Southampton, staged sweet peas and early-flowering gladioli. Messrs. A. A. Walters and Son, Bath, made an effective display of rambling roses, pæonies, and other seasonable flowers.

Mr. W. J. Godfrey brought up from Exmouth a big bank of pelargoniums, Oriental poppies, delphiniums, and a large group of well-grown Solanum Wendlandi. From the King's Acre Nurseries, Lim., Hereford, came a choice exhibit of fruit trees in pots, comprising practically all classes, and showing skilful cultivation. The firm also showed cleverly designed floral arrangements, roses, and herbaceous plants. Messrs. Gunn and Sons, Olton, Warwickshire, exhibited phloxes, herbaceous flowers, and violas, their Viola cornuta purpurea being in capital form.

Messrs. R. H. Bath, Lim., Wisbech, made a bold display of pæonies, pyrethrums, carnations, and poppies. The excellent exhibit of ferns put up by Mr. H. N. Ellison, West Bromwich, struck a distinct note from the surrounding glow of brilliant colours. Messrs. G. Mallett and Co., Cheddar, exhibited an interesting collection of choice herbaceous plants.

Messrs. Dicksons, Lim., Chester, maintained their reputation as hardy plantsmen by showing a grand lot of the flowers in season. A large exhibit from Messrs. Stuart Low and Co., Bush Hill Park, Middlesex, included rambling roses, perpetual carnations, Metrosideros floribunda, and many other good things.

The collection of some eighty dishes of vegetables shown by Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, was splendid, and capitally staged. We cannot say more than that the exhibit was well up to Mr. Beckett's usual degree of excellence. A small collection of hardy flowers was exhibited by Messrs. Rich and Co., Bath; overcrowding rather marred the effect of this exhibit. Sweet peas were well shown by Mr. Robert Bolton, Warton, Carnforth.

A group of Malmaison and perpetual-flowering carnations in pots was arranged on the ground by Messrs. J. Jefferies and Son, Lim., Cirencester; the group was edged with adiantums and nephrolepis, and backed up by palms. A miscellaneous group of plants and cut flowers was arranged in a most effective and pleasing manner by Messrs. Wm. Cutbush and Son, Highgate. Bold spikes of eremurus, tall pillars of Hiawatha, Lady Gay, and other roses were interspersed with carnations and a variety of smaller subjects. Messrs. Bakers, Wolverhampton, occupied a large space with an exhibit of irises, aquilegias, hemerocallis, and other border plants.

From Messrs. Kelway and Son, Langport, came gorgeous pæonies and pyrethrums, the exhibit occupying the whole of the stage across one end of the tent. Zonal pelargoniums in excellent variety were shown by Messrs. Jarman and Co., Chard, who also displayed their well-known centaureas, carnations, roses, and a large mass of their sweet pea Mrs. Townsend. Messrs. Heath and Son, Cheltenham, had a very large and beautiful collection of fancy pelargoniums, which were a perfect blaze of colour: scented-leaved varieties were also staged in considerable numbers.

An excellent group of carnations, in pots, was put up by Messrs. Young and Co., Hatherley, Cheltenham, among which Mikado, Gwladys, Hon. Lady Audley Neild, and several very fine seedlings were conspicuous. Baskets of cut blooms were suspended at the back, and added to the charming effect. Messrs. Stuart Low and Co.'s group of orchids was particularly good. Cattleyas, cypripediums, dendrobiums, etc., were arranged in very artistic style. The whole end of a tent was occupied by Miss Hemus's sweet peas. The size, substance, and freshness of the flowers bore testimony to good culture at Upton-on-Severn. A new variety of much promise was named Charles Hemus. It is best described as a bright wine colour, and is of good form.

Roses in bunches, in boxes, in epergnes, and bamboo stands, were put up by Messrs. A. Dickson and Sons, Lim., Newtownards, co. Down. A new Wichuraiana hybrid, Dorothy Dennison, delicate flesh-pink; and two charming H.T.'s, Walter Speight and Countess of Ilchester, were specially noted.

A group of border perennials was staged by Messrs. H. and W. Evans, Llanishen, Cardiff. The varieties used were of popular subjects, and the flowers were clean and bright. The name of Laxton and strawberries go together. The Bedford firm's exhibit of these luscious fruits was very tempting to parched lips.

OUTDOOR EXHIBITS.

Messrs. Pulham and Son, 71, Newman Street, London, W., laid out a rock and water garden in the open. The waterfall and lily pond were well devised, and the rocky mounds at intervals along the banks, suitably planted, made up a picturesque exhibit. Coniferæ and shrubs were shown by the King's Acre Nurseries, Lim., and also by Messrs. J. Jefferies and Son, Lim. An exhibit of salads growing under cloches was made by Messrs. Sutton and Sons, Reading.

SEEDSMEN'S PAVILIONS AND SPECIAL STANDS.

As usual, a large number of the leading seedsmen occupied special stands, filled with their specialities, and an hour or two could be well spent in making a tour of this section of the show. Messrs. Toogood and Sons, Southampton, occupied an extensive pavilion, the frontage of which was decked with fine batches of verbena Miss Willmott, early gladioli, and irises, callas, and some excellent salpiglossis. Vegetables and grasses were also shown. Messrs. Dickson and Robinson, of Manchester, made a great display of swedes, grasses, and a collection of pyrethrums and other flowers. Samples of lawn grasses were well shown, and the whole stand was excellent. Messrs. Little and Ballantyne decorated the front of their stand with young coniferæ, spiræas, hydrangeas, and sweet peas. Messrs. Dickson, Brown, and Tait had a very attractive display of roses of the rambler class, marguerite Queen Alexandra, Spanish irises, and lily of the valley.

Messrs. Sutton and Sons, Reading, had their large pavilion, familiar to all frequenters of the Royal shows, and in it displayed vegetables, grasses, and flowers in wonderful variety and first-rate quality. The central glazed enclosure was well furnished with begonias, gloxinias, schizanthus, and liliums. The pavilion which accommodated the exhibits of Messrs. J. Carter and Co., Holborn, was among the most attractive features of the show. The centre was given over to a water garden, with dripping well, surrounded by ferns and other appropriate plants. Nymphæas and irises were planted in the water, and the margins of the pool were clothed with moisture-loving plants. Vegetables and a great variety of flowers were also well arranged on either side of the pavilion, roots, of course being well shown. A grand exhibit came from Messrs. E. Webb and Sons, Wordsley, Stourbridge: gloxinias, calceolarias, cinerarias, and sweet peas gave colour and charm to the central portion of the pavilion, while the soft green of the lawn grasses in the foreground was an effective foil to the brighter colours. Tomatoes, melons, and a few other culinary subjects were well represented, and the farm section contained the firm's well-known pedigree stocks of seed corn and roots.

Messrs. Dickson's, Lim., Chester, had flowering and foliage plants to relieve the more sombre samples of farm seeds. The Gloucester firm of Messrs. J. C. Wheeler and Son upheld their honour in their own county with a first-rate collection of vegetables, flowers, and plants. Messrs. Harrison and Sons brought potatoes, cabbages, etc., and some sweet peas and hardy border flowers from Leicester. Messrs. J. Jefferies and Son brought Spanish irises, poppies, carnations, and sweet peas wherewith to furnish their stand of seeds.

MEDALS AND SPECIAL AWARDS.

Gold.—Hugh Andrews, Esq.; Messrs. G. Gibson and Co.; Mr. W. J. Godfrey; Messrs. Heath and Son; Messrs. J. Jefferies and Sons, Lim.; Messrs. Bakers; Messrs. W. Cutbush and Son; Messrs. J. Cypher and Sons, for orchids; Messrs. J. Cypher and Sons, for stove plants; Lieut.-Colonel Holford for orchids; King's Acre Nurseries, Lim., for fruit; Sir J. Dorington, Bart.; Mr. Geo. Mount; Messrs. Dobbie and Co.; Mr. M. Prichard; Mr. C. F. Waters; Messrs. R. H. Bath, Lim.; Mr. E. Beckett; Messrs. Kelway and Sons; Lieut.-Colonel Holford, for amaryllis; Messrs. Alex. Dickson and Sons, Lim.; Messrs. Stuart Low and Co.; Messrs. Blackmore and Langdon; Messrs. Dicksons, Lim.

Silver-Gilt.—King's Acre Nurseries, Lim.; Mr. C. W. Breadmore.

Silver.—Mr. N. Langton; Messrs. Young and Co.; Mr. Wm. Vause; Messrs. J. H. White and Co.; Miss Hemus; Mr. C. W. Breadmore; Messrs. A. A. Walters and Son; Messrs. W. and J. Brown; Messrs. Harkness and Sons; Messrs. Bell and Sheldon; Messrs. Mallett and Co.; Messrs. Jarman and Co.; and Mr. H. N. Ellison.

R.H.S. AWARDS.

Gold Medals.—Messrs. J. Cypher and Sons, for miscellaneous group; also one for orchids and stove and greenhouse plants; Lieut.-Colonel Holford, for orchids (with recommendation for Lawrence Medal); Sir R. Baker, Bart.; Lieut.-Colonel Holford, for amaryllis; Messrs. Blackmore and Langdon.

Silver Cups.—Messrs. W. Heath and Son; Sir John Dorington, Bart.; Mr. J. G. Blacker; Sir R. Baker, Bart.; and Mr. E. Beckett.

Silver-gilt Medals.—Mr. W. J. Godfrey, for pelargoniums; Messrs. W. Cutbush and Son; Mr. W. Vause; Mr. J. Sharp; Mr. Wm. A. Holmes; Mr. Geo. Mount; Messrs. Dobbie and Co.; and Messrs. Stuart Low and Co., for orchids.

Silver Medals.—Hugh Andrews, Esq.; Messrs. Bakers; Messrs. J. H. White and Co.; Miss Hemus; Messrs. Toogood and Sons; Mr. Darlington; Messrs. A. A. Walters and Son; Messrs. W. and J. Brown; Mr. E. J. Hicks; Messrs. Harkness and Sons; Mr. M. Prichard; Mr. A. F. Dutton; Messrs. Bell and Sheldon; Messrs. R. H. Bath, Lim.; Messrs. Gunn and Son; Messrs. Alex. Dickson and Sons, Lim.; Messrs. Dicksons, Lim.; and Mr. H. N. Ellison.

Certificates of Merit.—Hugh Andrews, Esq., for eremuri; Philip Price, Esq., Treberton Court, for apples; Mr. Geo. H. Towndrow, Malvern Link, for roses; Mr. Wm. Vause, for plants; Messrs. J. H. White and Co., for Francoa hybrida King Edward VII.; Miss Hemus, for sweet peas Czarina and Chas. Hemus; Messrs. Toogood and Sons, for sweet peas; Messrs. Rich and Co.; Messrs. A. A. Walters and Sons, for zonal pelargonium Beauty of Kensington.

First-class Certificates.—Messrs. W. and J. Brown, Stamford, for Marguerite Perfection; Mr. C. F. Waters, for carnations; Messrs. Stuart Low and Co., for Ampelopsis Lowi, and for the Lowberry; Messrs. Blackmore and Langdon, for begonias Lady Greenall and Lady Dorington.

Gardeners' Royal Benevolent Institution.

On June 23, under the genial presidency of Lionel de Rothschild, Esq., a large gathering met at the Whitehall Rooms, Hotel Metropole, to celebrate the seventieth anniversary festival dinner of the Gardeners' Royal Benevolent Institution. In the gathering we noticed, among many others, such well-known folk as Colonel Mark Lockwood, Messrs. Harry J. Veitch, N. N. Sherwood, E. Sherwood, W. A. Bilney, W. Poupart, J. Walker, G. Monro, W. Sherwood, A. Tite, D. Thomson, N. F. Barnes, A. Mackellar, E. Cook, J. F. McLeod, A. W. Sutton, L. Sutton, Owen Thomas, C. Fielder, W. H. Page, R. G. Cuthbert, W. Iceton, E. Rochford, Jas. Hudson, A. Bedford, J. Willard, J. Anderson, W. Nutting, Mott, J. Sweet, D. Ingamells, etc., etc.

The usual loyal toasts were enthusiastically received and acknowledged, and then the Chairman, in proposing "Continued Prosperity to the Gardeners' Royal Benevolent Institution," reminded those present that this was the seventieth festival, but as the society was not eligible for an old age pension it again appealed to the public to carry on its work in the alleviation of the old age of gardeners and gardeners' widows, and in relieving cases of sudden distress. The Chairman caused some amusement by referring to a letter from a lady subscriber, who said she could only give one guinea this year, as she now needed the second guinea (usually given) to help on the suffragette movement. He was glad to find the society encouraged thrift, and consequently outsiders, so to speak, were duced to subscribe to the funds. It was encouraging to notice that a candidate received [illegible] votes for every guinea per annum contributed by him. Referring to gardens and gardening, he said that the fairest gardens existed in the British Isles; the best garden outside the kingdom that he new was half-way between Monte Carlo and Nice, and it was owned by an Englishman, and the gardener was an Englishman also. Remembering that gardening was so greatly advanced in this country, and everyone was so much indebted to the gardener and his art, he thought it not too much to expect that all interested should help the charity to the best of their ability and the extent of their purses.

The duty of responding fell once again to Mr. Harry J. Veitch, the treasurer, and chairman of the committee, who sincerely thanked the chairman for presiding, and observed that Mr. Lionel Rothschild was the sixth member of his family to fill the chair, and he trusted that all the members of the family might long be spared to continue their benevolence. Mr. Veitch then indicated the work of the institution, and stated that £124,000 had been distributed in pensions since the foundation of the charity, and he showed how the interest of the Victorian Era Fund and the Good Samaritan Fund went to materially assist the deserving and waiting candidates for the pension. The youngest pensioner, he said, was 41 years of age, and totally paralysed; while many of the pensioners were totally blind. Two widow pensioners' cases were mentioned; in one case the husband received the pension five years, and his widow received £368 herself, or £468 in all, for a sum of £38 15s. contributed. In the other case husband and wife together received a total of £728, while the husband had but contributed eighteen guineas to the fund. Mr. Veitch read several very grateful but very pathetic letters from old pensioners of the charity, and used these to show how great is the comfort the pension brings to these people. Once again, Mr. Veitch pointed out that gardeners were not highly paid, and hence had few opportunities for saving. Every shilling contributed to the fund goes to the pensions, as the interest on invested funds goes to pay management expenses. Mr. Veitch paid the committee a high compliment for the work done, and strongly appealed for increased help for the G.R.B.I.

Colonel the Rt. Hon. Mark Lockwood, M.P., proposed "Horticulture in all its Branches," and said the love of gardening was firmly seated in the hearts of all classes of the community, and one evidence of this was to be seen at the Temple Show, where a big crowd inspected wonderful flowers and plants at considerable discomfort to themselves. Horticulture, he said, not only did not fear, but, indeed, welcomed, foreign invasion, for this country could hold its own well against all others in the art. He referred to the great humanising influence of gardening, and said he often had a convenient break down near any good cottage garden he might be passing in the country side, for the purpose of a chat with the owner. The toast was well received, and was responded to by Mr. A. W. Sutton, V.M.H.

Mr. Sutton, in responding, showed that the great reason why we had the best of everything in horticulture in this country was because so many of the nursery and seed houses specialised in one or more subjects, and he referred to the names of Veitch, Cant, Cheal, Milner, Monro, Hurst, Kelway, Bunyard, Low, Rivers, and others to support his contention. He hoped that whatever happened in political life horticulture would be the last recreation the wealthy and others would allow to suffer in any way. Mr. Sutton believed that no trade did so much good in the country, and everyone connected with horticulture was proud of it.

"Our Chairman" was most ably proposed in very hearty fashion by Mr. N. N. Sherwood, who, to everyone's satisfaction, appeared to be in excellent health. The toast was received with intense enthusiasm, and accorded musical honours, and was very gracefully responded to by the Chairman, who expressed his great pleasure at being present.

The subscription list was headed by the Chairman with 100 guineas, with Messrs. Rothschild, 100 guineas; Messrs. Hurst and Son, £100; Messrs. Sutton and Sons, £100; Mr. E. Sherwood, the result of musical performance, £100; Baron Schroder, 50 guineas; Mr. J. Vert, £50; Messrs. J. Veitch and Sons, 25 guineas; Covent Garden friends, £237 15s.; etc., etc., the total amounting to the splendid sum of £2,099.

As usual, the tables were charmingly decorated with choice flowers from various friends arranged by Mr. A. Bedford, of the Gunnersbury House Gardens, and the Chairman expressed the thanks of all to those who had helped to make the meeting a success, and, in conclusion, he proposed "The Health of Mr. G. J. Ingram," which was very heartily acknowledged, and suitably responded to by the able and energetic secretary.

The excellent musical arrangements were in the hands of Mr. H. Schartau.

MARKETS.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

LIME INCRUSTATION IN FOUNTAIN BASIN.—A Woking correspondent writes: "There is a fountain here, and the reservoir or basin is of mosaic work. The water used is very hard, and consequently the sides and bottom of the basin have become encrusted with lime. The water from the fountain is conducted so as to supply the necessary water for the green-houses. I should be very grateful to any of your readers for advice as to the best means of removing the encrustation without rendering the water poisonous to plant life, and also for suggestions for preventing the lime deposition." We shall also be obliged for any help our readers can afford in this matter.

EMPLOYMENT AT KEW. — A. P. H., Winchester: Write to the Curator, Royal Gardens, Kew, Surrey, for particulars of employment in the Royal Gardens, and he will send you them in official style, together with an application form to fill up and return.

ODONTOGLOSSUM CRISPUM. — S. O., Bakewell: Many thanks for notes and photo. We hope to use both shortly, and we congratulate you upon your success.

FERNS IN INVERTED BOTTLES.—F. S., Luton: The moist conditions that prevail inside a bottle when it is inverted, with its neck buried in the soil, are eminently suitable for the germination of fern spores. Fern spores, like fungus spores, are almost ever present, being borne easily on the wind, and attached to a multitude of subjects, and the chief reason we see so few resulting plants in certain areas is because the conditions are unfavourable to growth, or are vastly more favourable to other and coarser subjects. In your case the spores were evidently in the soil, and, finding a genial atmosphere and temperature within the bottle, they germinated and produced plants.

HOLLYHOCKS.—C. F. S., Cardiff: You may sow the seeds thinly in drills about six inches apart, out of doors, or in boxes in a cold frame, but in either case the sowing should be made without delay. In the case of the outdoor sowing the seedlings must be thinned to about six inches apart when large enough to handle, while the frame-grown seedlings must be picked off and then potted into large sixty-sized pots. If the strain is a particularly good one, it will pay to pot or box up the seedlings, even if outdoor sown, early in October, and winter them in a cold frame. Little water will be needed in the winter, and in April the plants may be set out where they are to remain.

ROSE CONRAD FERDINAND MEYER.—N. R. G., Bedford: In the Gardeners' Magazine of July 9, 1904, we gave an illustration of the fine rose Conrad Ferdinand Meyer, growing in Mr. Leopold de Rothschild's garden at Gunnersbury House, Acton, and accompanying the illustration we gave an account of the variety from the pen of Mr. Jas. Hudson. The rose was distributed in the autumn of 1899 by Mr. Otto Froebel, of Zurich, and it is said to have been raised by Pradel, who raised Marechal Niel, and the parentage is recorded as the progeny of Gloire de Dijon and Duc de Rohan crossed with Rosa rugosa germanica. The rose is a magnificent grower, has large pink fragrant flowers, and is generally flowering freely during the last week of May in the London district. It is a vigorous, and very hardy pillar or rambling rose, but not of the polyantha type, and it often makes growths 10ft. long in one season

ONCOCYCLUS IRISES.—C. T. F., Tavistock: This group of irises contains some of the finest species found in the whole of the large genus, and the flowers are among the largest. The rhizome is often very curious, the new bud being sometimes like a nipple at the end of the old growth, and sometimes set out with an elongated attachment. It will thus be seen that some members of the group are of more spreading habit than others. Warmth, light, well-drained soil, and practically no water at the roots from the withering of the leaf until growth again starts, are the chief points to remember if one would be successful with these beautiful, but difficult subjects. The leading species of oncocyclus irises are I. acutiloba, I. atrofusca, I. Barnumiæ, I. Bismarckiana, I. Gatesi, I. Helenæ, I. Heylandiana, I. iberica, I. Lorteti, I. lupina, I. Mariæ, I. Meda, I. paradoxa, I. Sari, I. Sofarana, and I. Susiana.

DRILL HALL AND ROYAL HORTICULTURAL HALL MEETINGS.—M. E. J., Colchester: The last meeting of the Royal Horticultural Society held in the London Scottish Drill Hall, Westminster, was on Tuesday, June 28, 1904, and the first of the fortnightly meetings held in the new hall in Vincent Square was on July 26 of that year. The hall was opened by his Majesty the King on Friday, July 22, 1904.

CATTLEYA SKINNERI.—B. M. M., Tibshelf: Repot the plants at once, placing them in deep pans with perforated sides, or in teak baskets. Provide ample drainage, as hardly any cattleya so quickly resents a saturated and sour rooting medium. Peat, sphagnum moss, a few broken oak leaves (last year's), and some broken charcoal will provide a suitable compost.

SAWDUST AS A TOP-DRESSING. — J. P., Exeter: On no account should sawdust be used either as a top-dressing for garden crop, or for use in the soil itself. Where quantities of sawdust are readily available they become valuable in association with garden refuse, all being burned together; the resulting ashes, finely sifted and mixed with fine soil, form a useful top-dressing for potatoes and other crops that benefit from a dressing of potash.

GRUBS IN ROSE LEAVES. — O. J., Tring: The grubs are those of the Brown Rose Grub (Spilonota roborana) and the best way of dealing with it is to carefully look over the rose bushes, and firmly squeeze any leaves that are curled inwards or that are spun together, thereby killing the pest. It is too late to spray with arsenate of lead.

COTTON THISTLES.—A. T. B., Bristol: The only annual species we know that rises to a height of 6ft. is Onopordon macracanthum, a native of Barbary. Sown in rich light soil in early autumn the resulting seedlings will grow luxuriantly the following spring and summer, and flower about July. It is a striking plant, with narrow, spiny leaves. The perennial O. Acanthium will attain a height of 8ft. under the best conditions of soil and position, while the biennial O. arabicum, with white woolly stems and leaves, and purple flowers will grow 10ft. high. For bold effects in openings among shrubs, for the outskirts of semi-wild gardens, and for use in association with subtropical plants, these giant Cotton Thistles have much to recommend them.

EDIBLE RADISH PODS.—S. K., Cleethorpes: There are two varieties of radish having edible seed pods. One is known as the Madras radish, and the other as the Rat-tailed radish. The latter produces very long seed vessels, often ten inches long, and about as thick as a pencil. These pods are gathered before fully grown and eaten raw, like our garden radish roots are, or pickled in vinegar. Sown in late spring in a warm position, these edible-podded radishes begin to bear usable seed vessels in about three months' time. We do not know any garden in this country where this radish is grown for use.

LUPINS. — M. M. J., Rodmersham: Where lupins have a deep soil and flower well the display may be continued for some time if the leading spikes are cut out directly they have lost about two-thirds of their flowers. By this time the apical flowers will be open and ready to fall soon, therefore their removal is practically no sacrifice. On the other hand the removal of the spikes that have practically run their course permits the lower axillary spikes to develop and carry on the display.

NAMES OF PLANTS.

A. W. J., Norfolk.—1, insufficient for identification, send flowers; 2, see next issue; 3, Onychium japonicum.

E. M., Cirencester. — 1, Calceolaria Burbidgei; 2, Primula japonica; 3, Costus ignea; 4, Odontoglossum Halli.

T. S. K., Kingston.—1, Lithospermum prostratum; 2, Weigela rosea; 3, Viburnum Opulus; 4, Dictamnus fraxinella alba; 5, Cytisus hispanica.

A. L. P., Chichester.—1, Lithospermum prostratum; 2, Thalictrum purpureum; 3, Iris pallida; 4, I. sibirica; 5, Deutzia scabra; 6, Weigela rosea.

F. T. V., Wycombe.—The specimens were very poor ones; 1, an anemone; 2, Begonia maculata; 3, Larix europæa; 4, probably Cupresus macrocarpa; 5, not recognised; 6, a fastigiate form of Cupressus Lawsoniana.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WEED KILLER used once a year "No weeds can live." RICHARDS' ARSENATE OF LEAD for all leaf-eating insects. CUCASA (fungicide), the finest preparation of copper ever offered to gardeners. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Floral Diversity.

When we consider that all flowers are really composed of modified leaves, and when we compare the leaves with the flowers, and remember the fundamental identity of the reproductive function which those flowers are intended to perform, their diversity of form and colour can hardly fail to strike us with wonder. Originally, when something akin to flowers began to be evolved from the flowerless or spore-bearing plants, which are undoubtedly the progenitors of all the flowering ones, they must have been very simple, possibly something akin to the yellowish green flowers we now see in some of the spurges, in which yellowish bracts or pseudo-leaves surround the inconspicuous blossoms, a phase of development which we see in a still more striking form in the poinsettias, whereon large bracts of brilliant colours surround the small blossoms proper, and are popularly mistaken for the flowers themselves. The primary object of conspicuous additions to the seed vessels was the same in all cases, namely, to form an attraction to the insect world, whose visits had become necessary to carry the pollen from bloom to bloom when, under drier conditions of environment, direct fertilisation by swimming organisms had become impossible. Even at this early stage of floral evolution it is probable that a branching into two classes began, since the wind is as potent a vehicle for dry pollen grains as flying insects. There is, however, one essential difference between the two media, the wind exercises no choice but simply scatters the pollen grains broadcast in all directions; the insects, on the other hand, as is obvious by the results, not only exercise choice, but are themselves of so varied a nature, or so diversely constructed, as to effect the same object in very varied ways. The inevitable result has been that wind fertilised flowers have remained comparatively inconspicuous, the male flowers usually less so owing to their great numbers due to the need of an abundance of pollen to make up for the waste of indiscriminate distribution, while the female flowers are comparatively few and small, consisting frequently of a mere brush-like stigma attached to the embryo fruit. Those members of the primeval flower tribe which began by attracting insect attention by conspicuous leaf modification associated with distinctive colours, soon responded to insect selections by producing brighter and larger flowers in succeeding generations, owing to the simple fact that the brighter and larger these were the greater chance they had of being fertilised and so producing a greater number of offspring inheriting their greater attractiveness, while the less conspicuous were ignored, and consequently died out. Massed blooms, too, had a better chance than sparsely distributed ones for the same reason, and hence, while some flowers attained their object by increase of individual size, aided maybe by specially attractive odours or richer nectaries, others varied on the lines of association and groupings. This line itself assumed varied types, thus we get the huge flat masses of small flowers of the hemlock, the long pendulous racemes of the wistaria or laburnum, the erect plumy masses of the spiraeas, and in another direction altogether the densely massed blooms of the composite family, wherein most of the true or fertile flowers are compressed together in a central disc, while greater conspicuousness is attained by an external circlet of barren ones whose reproductive energy is transmuted into leafiness. To all this diversity of arrangement must, of course, be added that of individual form of the flower itself, which may be imagined as having something akin in its nature to the forces which determine crystallisation in minerals, since whole tribes of flowers, as, for instance, the great rose family, adhere to a similar number of petals arranged at the same angle, five forming the circle in all normal blossoms. Others, as in the cruciferae, always have four petals, forming a cross, whence the botanical name of the tribe. Outside these regularly formed flowers there is a host of what may be termed curios, such as the aristolochias, antirrhinums, orchids, etc., etc., which in some subtle way have responded to insect or other determining influences and lost all radiating or crystal-like symmetry, their irregularity, however, being often associated with very marvellous contrivances for effecting that fertilisation which is the primary object of all flowers. It is perhaps in this particular direction that it becomes most difficult to understand our opening remark, that all flowers are modified leaves. In green roses, green dahlias, and other similar reversions, we see some evidence of this undoubted fact, and in the arum lily tribe we get a glimpse of a link between leaf and flower. Nature, however, in the instances cited, has gone so far beyond the symmetrical type that it is impossible to form a conception of how it has been done, and we must be content to accept the fact, for fact it is, as one of the innumerable mysteries with which we are surrounded.

MR. LIONEL DE ROTHSCHILD.

Mr. Lionel de Rothschild, whose portrait we have the pleasure of giving herewith, is, in common with his father, Mr. Leopold de Rothschild, and other members of the great family to which he belongs, keenly interested in the various aspects of horticulture, and a generous supporter of the gardening charities. Mr. Lionel de Rothschild's sympathy with gardeners and their widows was made abundantly manifest on the occasion of the anniversary festival of the Gardeners' Royal Benevolent Institution, at which he presided. Not only did he make a liberal donation to the funds of this valuable charity, but, in a speech of exceptional ability, he showed how fully he sympathised with gardeners who, from old age or other cause, are no longer able to take an active part in the battle of life, and with the widows of gardeners who had passed away without being able to make other than scant provision for them: and how thoroughly he appreciated the importance of the Gardeners' Royal Benevolent Institution as a means of ameliorating their circumstances. As evidence of Mr. Lionel de Rothschild's interest in gardening it may be mentioned that the beautiful Japanese garden, which forms so distinct and attractive a feature of the Gunnersbury House grounds, are largely due to his initiative. Travelling in the East some years ago, he was much impressed by the charms of some of the gardens in Japan that he visited, and brought home a series of photographs illustrative of the features of several of the best of them. These photographs, as Mr. Hudson, the talented gardener at Gunnersbury House has told us on several occasions, formed the basis of the Japanese garden within the grounds of this well-known establishment. We remember with pleasure the active part taken by Mr. Lionel de Rothschild in contributing to the pleasure of the members of the R.H.S. Conference on Genetics on the occasion of their visit to Gunnersbury House, and the thorough acquaintance evinced by him with the remarkable collection of water lilies in the gardens of this well-known residence. Mr. Lionel de Rothschild, we would add, is a prospective candidate for Parliamentary honours in Mid-Bucks.

Rose Trials at Bagatelle.—The new roses in the trials that are being conducted at Bagatelle, near Paris, have been judged, and the jury awarded two medals, one to Lyon Rose, which we recently illustrated, and Madame Segond Weber. Mr. Arthur W. Paul, who was a member of the jury, tells us that M. Gravereaux's rosery at L'Hay was in splendid condition at the time of his visit.

Wolverhampton Floral Fete.—The flower shows annually held at Wolverhampton have, by reason of their extent, the high quality of the products, and the completeness of the arrangements, long been of much interest both to horticulturists and the general public, as evidenced by the attendance. This year the exhibition, which will be held on the 13th inst. and two following days, will be of quite exceptional interest from the fact that it will be the twenty-first of the series and that the committee is making strenuous efforts to ensure the "coming of age" being celebrated in a befitting manner. Fortunately the Royal Horticultural Society's exhibition at Holland Park will not, as for several years past, clash with the Wolverhampton show, and it is anticipated that as the result many of the firms who have been unable to be present at the latter show for several years past. will be strongly represented. We have, in a previous issue, called attention to some of the more important classes in the schedule, such for example as those for groups arranged for effect, for stove and greenhouse plants, for cut flowers of hardy plants, and for collections of choice fruits, in which the prizes are exceptionally liberal. We need not, therefore, do more than express the opinion that the additional classes which have been provided should be the means of greatly enhancing the interest and attractions of the gathering. The Wolverhampton show has long been remarkable for its display of roses, but this year it should surpass itself in connection with these flowers, for there are twenty-five classes provided for them, and the dates should suit both Southern and Northern growers. Sweet peas are also liberally provided for, and these should of themselves form a great and highly attractive exhibition. We need hardly say that we shall fully report this great gathering in our issue for the 17th inst.

The Gardeners' Magazine for July 10 will contain fully illustrated reports of the Metropolitan exhibition of the National Rose Society, and of the Royal Horticultural Society's great exhibition at Holland Park. The Hanley Floral Fête will also be fully reported in the same issue.

The Gardeners' Company.—On Tuesday last the Master, Wardens, and Clerk of this company waited upon the Lord Mayor and the Lady Mayoress at the Mansion House for the purpose of making a presentation of flowers, vegetables, and herbs. As we have previously mentioned in our references to the Gardeners' Company, its freemen experienced a difficulty in selling their produce in the London markets owing to the opposition of unqualified persons. In the year 1632, the company petitioned the Lord Mayor for redress, which was obtained. In remembrance thereof the company determined last year to make an annual presentation of flowers, vegetables, and herbs to the Lord Mayor. The products presented on Tuesday were arranged in a gilt basket in the form of the company's ancient crest. The Lady Mayoress was also presented with a bouquet of orchids. The Lord Mayor in accepting the gift said he was much gratified that the presentation would find annual observance, and hoped it may long be continued. The representatives of the Company were subsequently entertained at luncheon.

Pyrethrums from Langport.—A few days since we had the pleasure of receiving from Messrs. Kelway and Son, Langport, a gathering of flowers of single and double pyrethrums. The flowers sent by the firm include several of the fine varieties raised at Langport, and are especially attractive and fully represent their great decorative value, both in the garden and house.

Market Gardens and the Finance Bill.—In the House of Commons on Tuesday Mr. Rendall asked the Chancellor of the Exchequer whether land which was developed for the industry of market gardening will be exempt from the undeveloped land tax under the Finance Bill. Mr. Hobhouse, who replied on behalf of the Chancellor of the Exchequer, stated that land used for market gardening is agricultural land within the definition contained in clause 27 of the Finance Bill, and will, therefore, be subject to undeveloped land duty under clause 10 (2), unless its value does not exceed £50 per acre, or unless it comes within the other exemptions specified in clause 11.

Orchid Fanciers' Visit to Haywards Heath.—On Friday, June 25, many members of the Royal Horticultural Society's Orchid Committee, including Mr. J. Gurney Fowler, Mr. Harry J. Veitch, V.M.H., Mr. R. Brooman-White, Mr. W. Cobb, Mr. R. G. Thwaites, Mr. H. Ballantine, V.M.H., Mr. Forster Alcock, Mr. Waters Butler, Mr. F. J. Hanbury, Mr. Stuart H. Low, Mr. W. H. White, Mr. W. P. Bound, etc., etc., paid a visit to Messrs. Charlesworth and Co.'s fine new orchid establishment at Haywards Heath. The majority of those who accepted Mr. Charlesworth's invitation met at the Royal Horticultural Hall at 11 a.m., and motored down, returning to town by motors in the evening. Everyone was delighted with the splendid arrangement and appointments of the nursery, and vastly interested in the thousands upon thousands of seedling orchids, and the stocks of rare species and hybrids. The visit was altogether a most pleasant and instructive one, and Mr. Gurney Fowler aptly voiced the feelings of the visitors when he thanked Mr. Charlesworth for his invitation and his generous hospitality.

National Sweet Pea Society's Outing to Essex.—The hon. secretary of the National Sweet Pea Society asks us to state that owing to the lateness of the season the society's outing to the Essex seed farms has been postponed from July 9 to (probably) July 17.

Keeping Strawberries Clean.—One of our medical contemporaries has of late been greatly exercised in mind because of the supposition that growers of strawberries for market put rotten manure under the fruit when ripe to keep it clean! Writing about the strawberry, the editor observes, "In our desire to maintain the reputation of this wholesome and delicious fruit . . . . we condemned a practice that has grown up in certain quarters of placing rotten manure under the ripe berries to keep them off the soil . . . . . . and we suggested that it should claim the attention of medical officers of health in strawberry-growing districts." The practice of putting rotten manure under ripe strawberries, if it existed elsewhere than in the fertile imagination of our contemporary, could not well be too strongly condemned. But it does not exist and it is inconveivable that any cultivator would put rotten manure under ripe strawberries for the purpose of keeping them clean. What is done in many gardens and fields is to lay down carefully selected long litter from the stable between the rows when the flower trusses are in process of development, and this becomes so thoroughly purified by exposure to the weather before the fruit reaches maturity that it is practically equal to clean straw, so far as the purpose for which it is laid down is concerned. We are not surprised that a resident in Hampshire should indignantly repudiate the practice, but it is surprising it should be stated in connection with this repudiation that "in other parts of England rotten manure is freely used."

Sale of Scottish Fruit.—At the annual meeting of the Clydesdale Fruit Growers' Association the question of the sale of Scotch fruit in the English markets was discussed. Letters were read from fruit salesmen in Manchester, Huddersfield, Nottingham, Liverpool, Sheffield, Halifax, Birmingham, and Bradford, offering to sell Scotch fruit in the English markets at a charge varying from 5 to 10 per cent. It was agreed to write other fruit brokers in England, and to point out that no more than 7½ per cent. commission would be paid in any case. The further arrangement of the matter was left in the hands of a committee. The question of drawing the public attention to the distinction between "home grown" and "Scotch" in relation to the sale of tomatoes was discussed, and it was decided to advertise in the press pointing out the difference between the two terms. It was decided to leave the power of distributing the various consignments of Scotch fruit to the English markets in the hands of the Scottish agent appointed for the purpose.

The President Potato.—In his report on the potato trade in Lincolnshire in 1908-9, which appears in the Journal of the Board of Agriculture, Mr. H. Amos refers in appreciative terms to a potato known as The President. He writes: "Throughout the season the favourite potato has been the Up-to-Date, and, both in cooking qualities and appearance, it has been hard to beat. Its one great fault is its liability to disease. The nearest approach to the Up-to-Date is a potato called The President. It is a good cropper, and grows a fine oval sample with russet skin, and is one of the most disease-resisting potatoes in cultivation. It was raised in Holland in 1901 from two German varieties. Until now this potato has mainly been grown on peat and sand, but in the spring of 1907 a few were planted in clay or loam with success. It is said that those farmers who tried them intend to replant the whole of last season's growth. It appears to be one of the safest varieties to grow, and it is certainly a long way in front of Evergood and Royal Kidney, both in crop and quality, and is quite as free from disease. It has the vigour and quality of the Up-to-Date, and is equally good in sample. I have seen several excellent crops in the district of Chatteris and Ramsey St. Mary, which were an excellent sample, and sold very freely."

Gardening for School Children.—At the exhibition of the Wood Green Horticultural Society, to be held this month, there will be a section devoted to children attending the public elementary schools. The Wood Green District Council has supplied the children with the plants and soil, and one of the Councillors gave them the pots. The plants have been grown by the children at their own homes, and it is anticipated that there will be about 2,000 juvenile competitors.

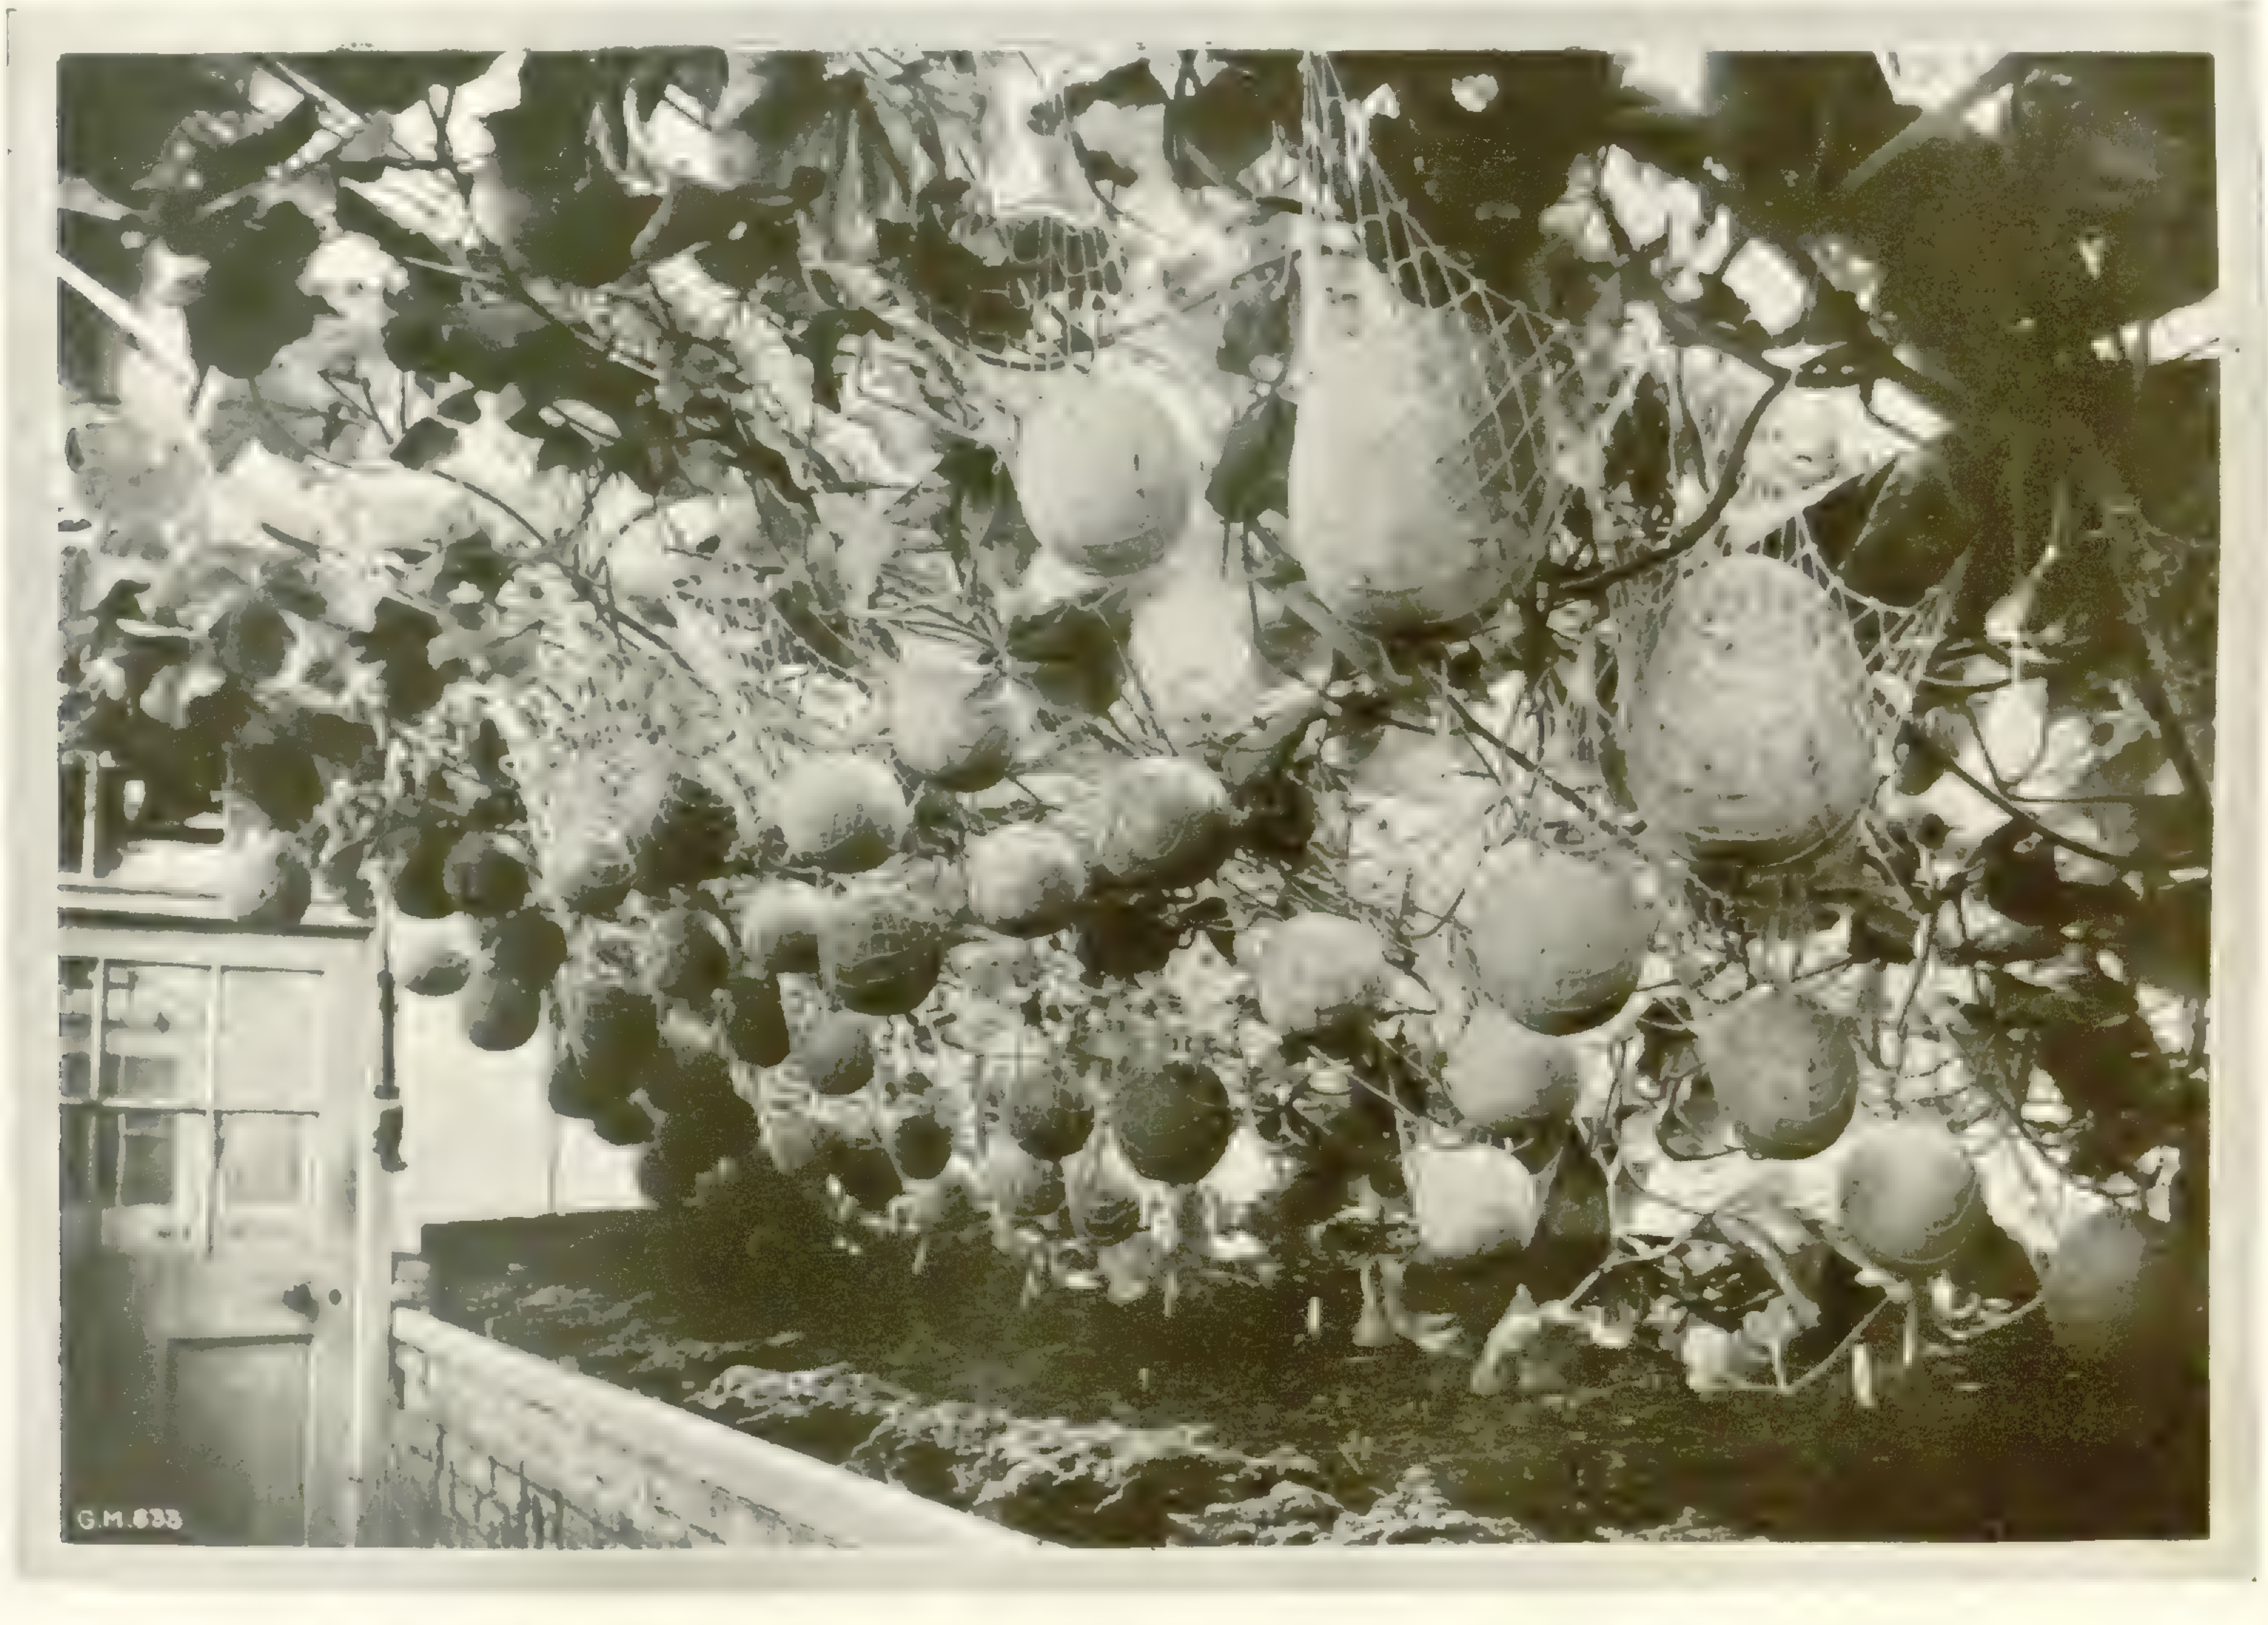
Outbreak of Bee Disease.—The Board of Agriculture and Fisheries issues a warning to bee-keepers that an outbreak of disease, believed to be identical with the Isle of Wight bee disease, has occurred in several hives in Buckinghamshire. This disease, which has destroyed almost all the bees in the island from which it takes its name, is due to a bacillus closely resembling the bacillus of Plague, and no remedy for it is known. It is of the utmost importance therefore, that bee-keepers should take every precaution to prevent the disease spreading, and they are strongly advised to keep a careful watch for any signs of its appearance. A full description of the disease was published in the Journal of the Board of Agriculture for February, 1909, and bee-keepers who find symptoms of disease corresponding to the description there given should communicate with the Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W.

Electricity in Plant Culture.—The Emperor of Germany, according to the "Evening Standard," has introduced on his private estates at Dahlen, a few miles from Berlin, the new system of stimulating the growth of plants by electricity. Experiments systematically conducted under the supervision of Dr. Höchstermann are said to have demonstrated that the growth of plants, flowers, and, in fact, all kinds of vegetation thus far tested can be stimulated by charging the air above and around them with electricity. Further systematic experiments are now being carried out to ascertain the precise differences in the growth of plants in an atmosphere charged with electricity and plants which grow under normal conditions, and also to find a cheap and simple method of charging the atmosphere with the necessary electricity.

A FINE CROP OF MELONS.

Herewith I send a photograph of one of the finest crops of melons I ever saw. The crop was grown by Mr. T. B. Field, The Gardens, Wych Cross Place, near East Grinstead.

The house in which the melons were grown is only a small one, being seventeen feet long by twelve feet wide, and having a path down the centre, with the back portion devoted to calanthes. Such a house, however, is large enough for an ordinary establishment. At Wych Cross there are three houses of this length devoted to the cultivation of melons, and these provide a good supply of fruit from May until November. The fruit in the first house was ripe early in May; on one side there were eight plants carrying seven fruits each, the largest weighing about nine pounds, while the average for the whole house was about five pounds each. Every fruit was perfect in shape, well ripened, and of first-class quality.



A HEAVY CROP OF MELONS IN WYCH CROSS PLACE GARDENS.

We often hear of fine crops of melons, but from so limited a space it is seldom that such excellent results as these are obtained, especially so early in the season as May, and during such a trying spring as was experienced in that district, but Mr. Field is quite an adept at growing melons, for his second house was quite equal to the first, and the third one was very promising. By having sturdy plants ready to plant out as soon as the first crop is cleared off, Mr. Field is able to maintain a continuous supply from these houses throughout the summer and autumn months.

H. C. Prinsep.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in The Amateur's Greenhouse, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

NOTES FROM KEW.

Many melastomaceous plants are less grown now than they were formerly, probably because they are of but little value for cutting from, which seems to be a very important consideration now-a-days. The blossoms of many of them are, however, remarkably showy, a character well exemplified in the case of Heeria elegans, of which there is a delightful specimen, full of flower, growing in a suspended basket in the cool portion of the T range at Kew. It is of neat, close growth, covering the outside of the baskets, and the shoots are so thickly studded with flowers that little else can be seen. The individual blooms are over an inch in diameter, and of a rich rosy-purple colour. The Kew Hand List only contains the name of one Heeria—viz., macrostachya—of which H. axillaris is a synonyme. There is no reference to Heeria elegans. It is certainly a novel and most charming basket plant.

Combretum purpureum.

In the warmest portion of the T range this stove evergreen climber, which was introduced from Madagascar as long ago as 1818, is in flower, and at once arrests attention by reason of its beauty and the uncommon nature of its blossoms. The slender, twining stems are clothed with dark-green, oblong, lanceolate leaves, while the flowers are disposed in spikes, several of which together go to form a loose, somewhat feathery panicle. The colour of the flowers is light scarlet, quite an uncommon tint among stove climbers. This combretum is not at all a vigorous-rooting subject, hence, when grown in pots it should not be allowed too much root room. At one time it was considered almost impossible to strike this from cuttings, but it does not now present any particular difficulty in this respect.

Clerodendron ugandense.

Among the promising and distinct plants that we have received from the Uganda district is this clerodendron, of which seeds were first received at Kew from Mr. M. T. Dawe, who collected them in a spot about 2,000 feet above sea level. As the plant is now flowering in the cool portion of the T range, where such Cape plants as pelargoniums, heaths, and mesembryanthemums are grown, it would appear that the temperature of a greenhouse is all that it requires. This species forms a free-growing shrub, with long, slender, leafy branches, terminated by loose racemes of flowers. They are in colour pale blue, with a much deeper lip. This tint, although it may not be unique among clerodendrons, is certainly very uncommon in the genus. Being of ready propagation by means of cuttings, and of simple cultural requirements, Clerodendron ugandense will, no doubt, before long be more generally cultivated.

Rehmannia Henryii.

In the greenhouse there is a small group of this new rehmannia in flower, which seems scarcely likely to attain the same amount of popularity as its relative, Rehmannia angulata. The new-comer is less in stature than the last-named, while the flowers are white, or nearly so, with yellow markings in the throat.

Dolichos Lablab.

This common tropical plant is now flowering freely in the greenhouse, and, as seen at Kew, it is certainly a very pleasing climber for that structure. The slender, climbing stems are furnished with rather pale-green trifoliate leaves, while the small pea-shaped flowers are borne in rather crowded racemes. They are very numerous, and in colour they are of a pleasing shade of pinkish lavender. Though so well known in many parts of the world, this dolichos is rarely seen treated as a greenhouse climber, but as seen at Kew it can certainly be recommended for such a position. K.

NOTES ON THE NEWER ROSES.

Some short time back I made a few remarks upon some newer introductions, and having a nice bed of maiden plants that are now coming into bloom, I venture to supplement my notes upon a few of the same varieties that were, and are still, growing under glass. It frequently happens that a rose is of far more use under glass than when growing in the open air, and it is with maidens budden upon the seedling and cutting brier stock that I am more particularly dealing now. The whole of them are looking well, but have had no special treatment other than that accorded to our older varieties, and, as they are growing upon the same quarter of ground, have not been coddled at all.

Grace Molyneux (H.T.) opens particullarly well, perhaps not quite full enough for exhibition, but a trifle too large in the bud for a coat flower. Very free in growth and bloom, and exceptionally sweet-scented. Creamy apricot, flesh centre, paling at the edges with age. Doubtless one of the best decorative roses we have, and it has also been excellent under glass.

Florence Edith Coulthwaite (H.T.) is one of the most perfectly imbricated roses we have. Good size, grand shape, very free, and with large, smooth petals. Quite a distinct colour, and difficult to describe. Yellowy cream, stippled with bright rose, which is far more pronounced towards the edges of the petals. The base of the older petals yellow, with delicate orange and peach at the base of the centre petals. This has also been very showy under glass.

Dr. O'Donel Browne (H.T.) is far more like a hybrid perpetual than hybrid tea in every respect. It is very distinct in colour, being a deep self-coloured carmine. I do not know of a sweeter-scented rose than those I have handled to-day. It combines the very best of the two great classes. The flowers are of immense size, built up of large, smooth petals. The habit is good; boldly erect, without being too long in growth. This comes very bright under glass.

John Cuff (H.T.) is another deep carmine-pink, and is doing very well in the open. It is not so strong a grower here as the last-named, but erect and robust. Large flowers and petals, well surrounded with foliage. Sure to be a good garden rose, and probably very useful in the exhibition box

Lyon Rose deserves a word or two, although so much has already been written in its favour. It is grand on the maidens now, as well as upon a few cutbacks. Some flowers to-day (June 22) were five to six inches across, and perfect in form. A doubt has been raised in the Press as to whether this rose is quite as hardy and constant as was imagined. It has no fault here, except what might perhaps be attributed to over-propagation; every little bud or growth has been worked, and this naturally produces some few plants of indifferent constitution. A few of the earliest flowers upon maidens came pale, but those on the cutbacks possessed the unique shrimp-pink and orange shade to perfection.

Arthur R. Goodwin is a second grand production from Pernet-Ducher, and, like Lyon Rose, appears to have much of the Pernettiana strain. This is a particularly free grower, and bloomer, and very sweet-scented. Large, good form, and the bulk of the flowers are the deepest of apricot found in an extra well-coloured Lady Roberts. It has been very good, too, under glass, and will make a grand forcer. This is very bright and distinct.

Mrs. Joseph Milner (H.T.), a very large and full flower. Soft peach-blush, with a yellow base; quite a distinct rose.

Mrs. David Jardine (H.T.) was dwelt upon in my previous notes, and continues to improve upon further acquaintance, both under glass and in the open. A capital grower in every respect, and a large, well-built up flower that remains fresh longer than most. A clear rosy-pink, shading to soft salmon with age. First class for all purposes.

Madame Maurice de Luze (H.T.) is very large, full, and cup-shaped; blooms carried on long stems; and is the deepest of cochineal carmine in the centre, with deep rosy-pink on the outsides. Will make a good forcer.

Madame Paul Gruetz (H.T.) favours Mme. Jules Grolez in colour, but is paler and much larger. It is quite distinct here, and is a stronger and more robust grower.

Senateur Mascurand (H.T.) is a free and yet erect grower of deep golden-yellow colour, promises well, but is apparently an indifferent opener.

The following are a few older roses that deserve a word or two:

Lady Helen Vincent (H.T.) is coming well again, and will become a permanent variety in the garden. A large and well-formed bloom; shell-pink, suffused with peach and yellow. Mrs. Harold Brocklebank is producing some grand flowers, carried very bodly. A creamy-white, with soft yellow centre. Another rose that pleases more each season is Mme. Jeanne Guillemot, which is very free and good here throughout the season. The buds are long and well-formed. Deep saffron, shaded pale rose, opening to pale yellow, an excellent autumn rose, and very sweet-scented. Mrs. Aaron Ward is variable in colour thus early in the season; almost as much so as we sometimes find William Allen Richardson. The same applies to some of our blooms of Joseph Hill; but the flowers are always good. Rhea Reid is coming a grand colour in the open; as deep as Richmond, and with none of the cherry-red found under glass during the winter.

Uckfield. A. Piper.

FEEDING FIG TREES.

The inexperienced cultivator may make a mistake, first, by planting fig trees in a large border of loose soil, and in the second place by feeding such specimens in the summer time, thus inducing a very undesirable strong growth. For more than ten years I had charge of a large garden in which fig trees were extensively grown. Several specimens which were planted in borders where manure had to be dug in for the benefit of vegetables and similar plants, always gave me a lot of trouble owing to the very strong shoots which were made year after year. Careful pruning and not any feeding was the rule, and fine crops of figs resulted. In another part of the grounds we had a pergola of fig trees about two hundred and fifty feet long. The trees were old, and growing in firm ground on which there was much walking to and fro from time to time. The result was short-jointed growths, well matured, and on which heavy crops of fruit were borne. In this instance, and in others, where the roots of the trees were confined in brick pits, feeding could be done with benefit to the trees and fruit. Geo. Garn

SPECIAL OFFER OF DARWIN & MAY-FLOWERING (COTTAGE) TULIPS.

Before you lose your notes made at the R.H.S. Meetings, and Provincial Spring Flower Shows, place your orders for the above. We are LARGE GROWERS of these Tulips, and can offer very advantageous prices. The Bulbs are as fine as can be grown anywhere.

MODERN GLASSHOUSES,

whether acquired for pleasure or profit, should be designed and constructed by experts if durability and lasting satisfaction be desired. We have specialised for 50 years in Greenhouse construction, and can give our customers the most useful designs, the latest improvements, the best quality materials, and the most competent workmanship. Everything required for Glasshouse Building and Heating is made at our works.

Plans and Estimates for all kinds of Glasshouses and Heating sent free on receipt of particulars.

Contractors to H.M. Board of Works, H.M. Admiralty, H.M. War Office, etc., etc.
Awarded Gold Medal of the Society of Architects and Six Medals of the Royal Horticultural Society.
WRITE FOR ILLUSTRATED CATALOGUE G.

Recent Contracts include the following :—

His Grace the Duke of Bedford, Woburn Abbey.
His Grace the Duke of Buccleuch.
The Rt. Hon. the Earl of Craven, Coombe Abbey, Coventry.
The Rt. Hon. the Earl of Stamford and Warrington, Dunham Massey Hall, Altrincham.
The Rt. Hon. the Earl of Dysart, Buckminster Park, Grantham.
The Rt. Hon. the Earl of Portsmouth, Hurstbourne Priors.
The Rt. Hon. the Earl of Lathom, Lathom, Ormskirk.
The Rt. Hon. the Earl of Wimborne, Merly House, Wimborne.
The Rt. Hon. Earl Fortescue, Castle Hill, Devonshire.
The Rt. Hon. Lord Hillingdon, Hillingdon Court.
The Rt. Hon. Lord Aldenham, Hilfield, Aldenham.
The Rt. Hon. Lord Dunboyne, Knoppogue Castle, co. Clare.
The Rt. Hon. Lord Hatherton, Teddesley, Penkridge, Stafford.
Sir J. B. Robinson, Park Lane, W. (Conservatory at Cape Town).
Sir Robt. Peel, Drayton Manor, Tamworth.
Sir Philip Chetwode, Oakley Hall, Market Drayton.
Count Gurowski, Woolhampton House, Reading.
C. G. Cunard, Esq., Notgrove Manor, Cheltenham.
Mrs. Geoffrey Lubbock, Broad Oaks, Byfleet, Surrey.
H.M. Board of Works, Glasshouses in Hyde Park.
W. Waldorf Astor, Esq., Hever Castle, Kent.
A. E. Bowen, Esq., Colworth, Sharnbrook.
J. J. Sainsbury, Esq., Broadlands, Haverhill.
Libert Oury, Esq., Holwood House, Walton-on-Thames.
W. Pendle, Esq., White Rose Lane, Woking.
Dr. G. W. Drabble, The Grange, Walton-on-Thames.
Morgan Jones, Esq., Llanmiloe Mansion, Carmarthen.
F. A. Darwin, Esq., Bolton Lodge, Bolton Percy.
R. K. Fenton, Esq., Dutton Manor, Longridge, Preston.
Jas. D. Crosbie, Esq., D.L., Ballyheigue Castle, co. Kerry, Ireland.
H. K. Rutherford, Esq., Soloms Court, Banstead.
A. T. Cook, Esq., Sennowe Hall, Great Ryburgh, Fakenham.
Col. Le Roy Lewis, D.S.O., Westbury House, Petersfield.
Sir C. Swinfen Eady, Oatlands Lodge, Weybridge. (Quorn Boilers).
Messrs. Bass, Ratcliff and Gretton, "Quorn" Boilers for Heating Offices, etc.
Corporation of Bradford, Conservatories for four Public Parks.
Corporation of Oldham, Conservatories, etc., Alexandra Park.
Corporation of Ashton-under-Lyne, Conservatory at Stamford Park.

ORCHIDS FOR AMATEURS.

Odontoglossum crispum is now the most popular of all orchids, indeed the utility of the species cannot be overestimated. There is no plant more serviceable for exhibition and decorative purposes, while in a cut state the blooms are not only the most useful in the home, but they also are in great demand for the cut flower trade. There can be no doubt the cultivation of O. crispum is more extensive than was the case a few years ago, and as it becomes more appreciated it will be more extensively cultivated still.

I have no doubt the prices that from time to time have been realised for rare varieties of this species have had the effect of retarding their more general cultivation. I should therefore like to minimise this effect by assuring amateur readers that O. crispum can be procured in an imported state at the rate of about £5 per hundred. Here then we have a beautiful orchid which, if grown in quantity, will give us a succession of flowers at all seasons of the year, and at a modest outlay that will compare favourably with any class of plants grown. The plants can also be grown without an excessive amount of fire heat. A few years ago growers of odontoglossums advocated a normal temperature of from 40 to 45 degrees as sufficient for the winter, and some growers used to succeed fairly well, but of late years considerable advance has been made, and one of the chief causes of the more general success is that about ten degrees higher temperature has generally been given. Not only have the species been grown more satisfactorily, but we have been successful in raising many desirable hybrids, which at one time were considered almost impossible.

Speaking personally, I find very little difference between a lean-to house with a northern aspect and a span-roofed house. It matters very little so long as there is ample means of ventilation and shading to keep the temperature within reasonable bounds during the hottest part of the summer, and sufficient piping to maintain comfortable conditions in winter. The ordinary greenhouse will generally furnish the necessary requirements. The atmosphere throughout the year must be kept charged with moisture, and this is generally the difficulty amateurs fail to overcome. One may write and give instructions, but the difficulty of following these instructions is found when we realise that they may not be applied to every condition and situation alike. It would be far more beneficial to amateurs and those who are commencing orchid growing if they would visit some nursery or orchid establishment, where, I am sure, they could at all times obtain a practical illustration of the requirements, and how to meet them, which would be of the greatest possible service. I have for many years past advised, in detail, the general cultural requirements of cool orchids in the GARDENERS' MAGAZINE, and I feel convinced that they are still the most suitable for the attention of amateur orchid growers.

H. J. CHAPMAN.

Oakwood Gardens.

Chlorine in Rain.—Chlorine has been determined in the rain collected at Rothamsted each month for thirty-two years, and the results obtained during twenty-eight years have been published. The average amount of chlorine which the soil receives from the rain is 14.87lb. per acre per annum, of which 10.12lb. is supplied in the winter rain (October to March), and the rest, 4.75lb., in the summer rain (April to September). The yearly amounts have varied from 10.32 to 21.18lb., the low results being due to low, and the high results to high, winter rainfall.

GENISTA CINEREA.

The plant shown in the accompanying illustration is one of the most beautiful of the early-flowering brooms. If it has a fault, the only one I can think of is that its brilliant display lasts for so short a period, in fact rather less than a week. It seems but little known in gardens, though it has a wide range of distribution in the Western Mediterranean region, and has been in cultivation for many years. It is figured in the "Botanical Magazine" for 1906 at t. 8,086, and it is there described as flowering at Kew in June, but here it has always flowered in mid-May; but I have it growing on a sheltered bank of the rock garden, facing due south, which may account for its earlier habit.

The specimen shown is about 15 years old, measuring some 6ft. or more across, standing about 3ft. high at its most upright position, and with trailing branches sweeping down to the path.

Its great charm lies in its brilliant colour, a singularly clear shade of yellow, quite free from orange tints, and when in bloom the small leaves are quite hidden by the wealth of flowers. I generally cut it over fairly hard directly after flowering, and then slender young growths soon appear, each of which will form the flowering shoots of the following season. In consequence of this annual shearing it produces very few seeds, and I find it difficult to propagate as it does not seem to root at all from branches that touch the ground.

E. A. BOWLES.

Myddelton House, Waltham Cross.

GENISTA CINEREA IN THE ROCK GARDEN AT MYDDELTON HOUSE, WALTHAM CROSS.

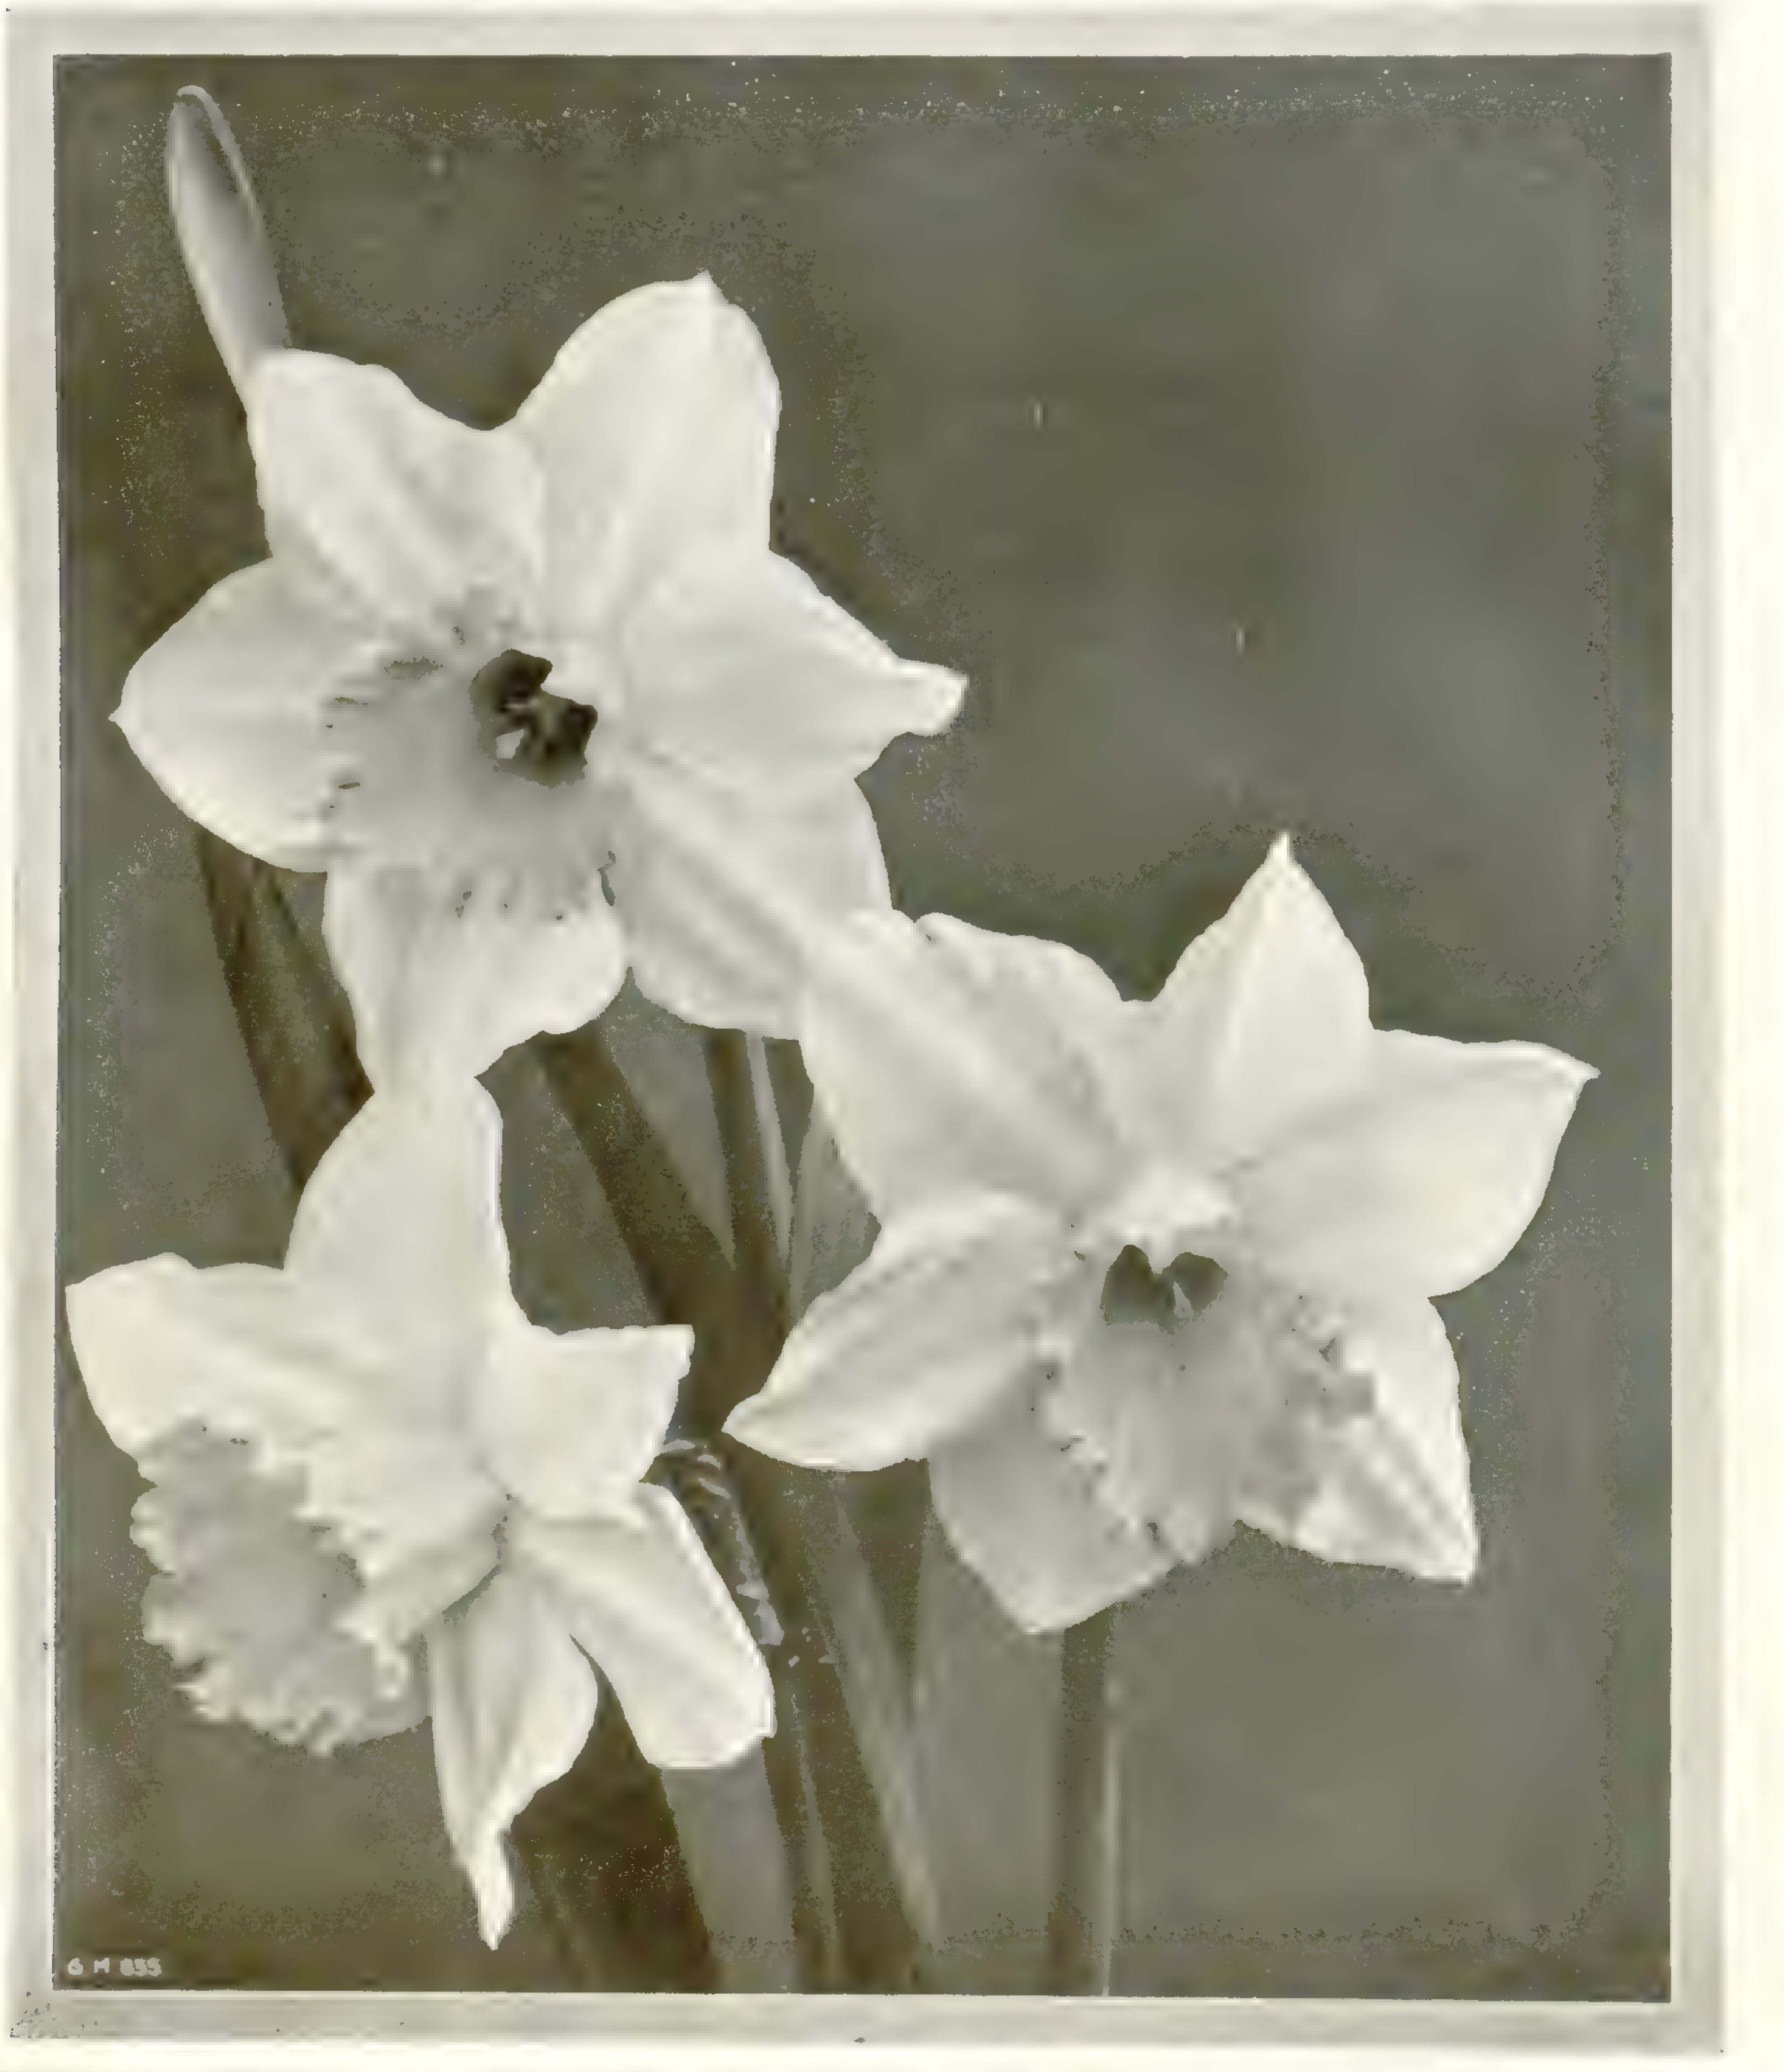
THE LOBED SPIRÆA.

There would appear to have been some unfortunate confusion about the name of Spiræa lobata, which, however, would lead one to have too long a tale to tell were one to go fully into the question. It will suffice, however, to say that the plant to which one is about to refer is not the tall spiræa known in gardens as S. lobata, which is Spiræa rubra and Ulmaria rubra of some, but S. venusta, of gardens. The plant now recognised as the true S. lobata is a charming little thing, entirely distinct from the border flower so long cultivated under the name of S. lobata. Instead of growing several feet high, it is only about six inches in height, and it has very beautifully cut leaves, and charming rosy-pink flowers in good heads. These are borne in summer, and in the rock garden, in a position not too dry, this little plant is a remarkably pretty one indeed. Its cultivation offers few difficulties, but it prefers a rather moist position, and likes a good loamy soil.

S. ARNOTT.

SHRUBBERY IMPROVEMENTS.

The autumn of the year has to be catered for at all seasons, even during summer; and where large shrubberies exist, some clearing out work is almost sure to be necessary in order to preserve and create a fair appearance right into winter. There are a number of methods by which quickly attractive results can be gained, one of the best being the introduction of clematises, which can be bought in pots blossoming and budding, and will go on without a check if carefully turned out into good soil and made especially firm therein.



NEW DAFFODIL LOWDHAM BEAUTY, A WHITE GIANT LEEDSI VARIETY.

The rhododendron thickets are apt to have a dull appearance in autumn, for which reason it is folly to mass those shrubs so closely that nothing else can accompany them; where this mistake has been made the branches of some should be tied in closely as soon as the blossom is over, and a clematis placed in the uncovered soil, after digging out a deep hole and filling it partly with a compost of fresh loam, leaf-mould, old manure, and road sand. As soon as September is with us a rhododendron here and there can be removed to other quarters, without disturbing the clematises, which will by then be beautifully clothing tall larch pole pillars. Any of the Jackmannis are suitable, and flower freely through October or even later.

There are other climbers that can be introduced from pots into the shrubbery nooks during summer; the new Polygonum Baldschuanicum, for instance, that carries myriads of pendant sprays of pink and white blossom for months in succession, seeming to thrive best when sheltered from the north by trees or fences; stout,tall larch poles, latticed between by painted wire, prove excellent for supporting this, while if there are young copper beeches, or other ruddy-leaved subjects for a background, the colour harmony will be perfect. Young plants of Vitis Coignetiæ are also obtainable in pots, and will give glorious tints late in the year to warm up any cold-looking collection of silver-foliaged shrubs.

Climbers are always attractive grown up larch poles or over dead trees, because the rustic wood does not interfere with the semi-wild look that shrubberies, especially if of large extent, should have; but in some places lengths of trellis work, or, better still, a kind of irregular trellis, formed of peeled oak boughs, can be set up to form a background to the scene. The pure white Clematis Viticella alba luxuriana, blooming as it does from June to November, is a delightful climber for this purpose, pot plants being sold for one and sixpence each. In other places the Red Jackmanni will be preferable, no doubt, or the favourite purple species.

Jasminum primulinum, the large yellow Jasmine that flowers in autumn as well as in spring, can also be highly recommended. Roses from pots are reliable, and, although the glory of ramblers will be over, we may have white Aimée Vibert, crimson-scarlet Climbing Papa Gontier, copper-red ameliorated by the strong "string" apricot, and a host of others. Tall stone or rustic urns, mounted on pillars, or square stands, graceful stone figures, and small fountains, are attractive ornaments to place in shrubbery spaces, where they are come upon unexpectedly at a turn of the walk. A tall arch spanning a portion of the border instead of the path, will provide another opportunity for the use of climbing plants.

There should be no stretch of earth visible in the shrubbery, for the foreground, if not planted permanently, can be seed-sown with dwarf, quick-growing annuals, so that colour and loveliness will be spread out. Where glades are formed by the parting of shrubs there should be extra charming vistas, and the free sowing of some of our simplest favourites will secure this. Candytufts, dwarf cornflowers, sweet alyssum, Asperula azurea setosa, Calandrinia speciosa, French marigolds, Tom Thumb clarkias, eschscholtzias, nemophilas, kaulfussias, Agrostemma cœli rosea, and viscarias will bloom six to ten weeks after sowing, the circumstances being favourable.

Division of dwarf plants can be practised in summer as a means of covering ground and introducing more beauty into the shrubbery; the variegated arabis and aubrietia being lovely in leaf as well as flower, are perfect for this employment, yet there is charm, too, in the tufted grey-green foliage of ordinary arabis, and the glossy rosettes of London Pride, the green trails of creeping jenny, the autumn-crimsoned leaves of heucheras, the moss of Saxifraga hypnoides,and the gold masses of stonecrop are never without value. We may well include cerastiums, alyssums, primroses, polyanthuses, and iberises in the plants for summer division and propagation, then we shall reap a reward of blossom in the spring.

Weeping or umbrella trees and shrubs offer pretty diversity among others, and often the gardener will find that fully-foliaged laburnums, etc., will need but judicious thinning out and tying to stakes with the removal of superfluous boughs, to persuade them to commence these effects.

M. H.

NARCISSUS LOWDHAM BEAUTY.

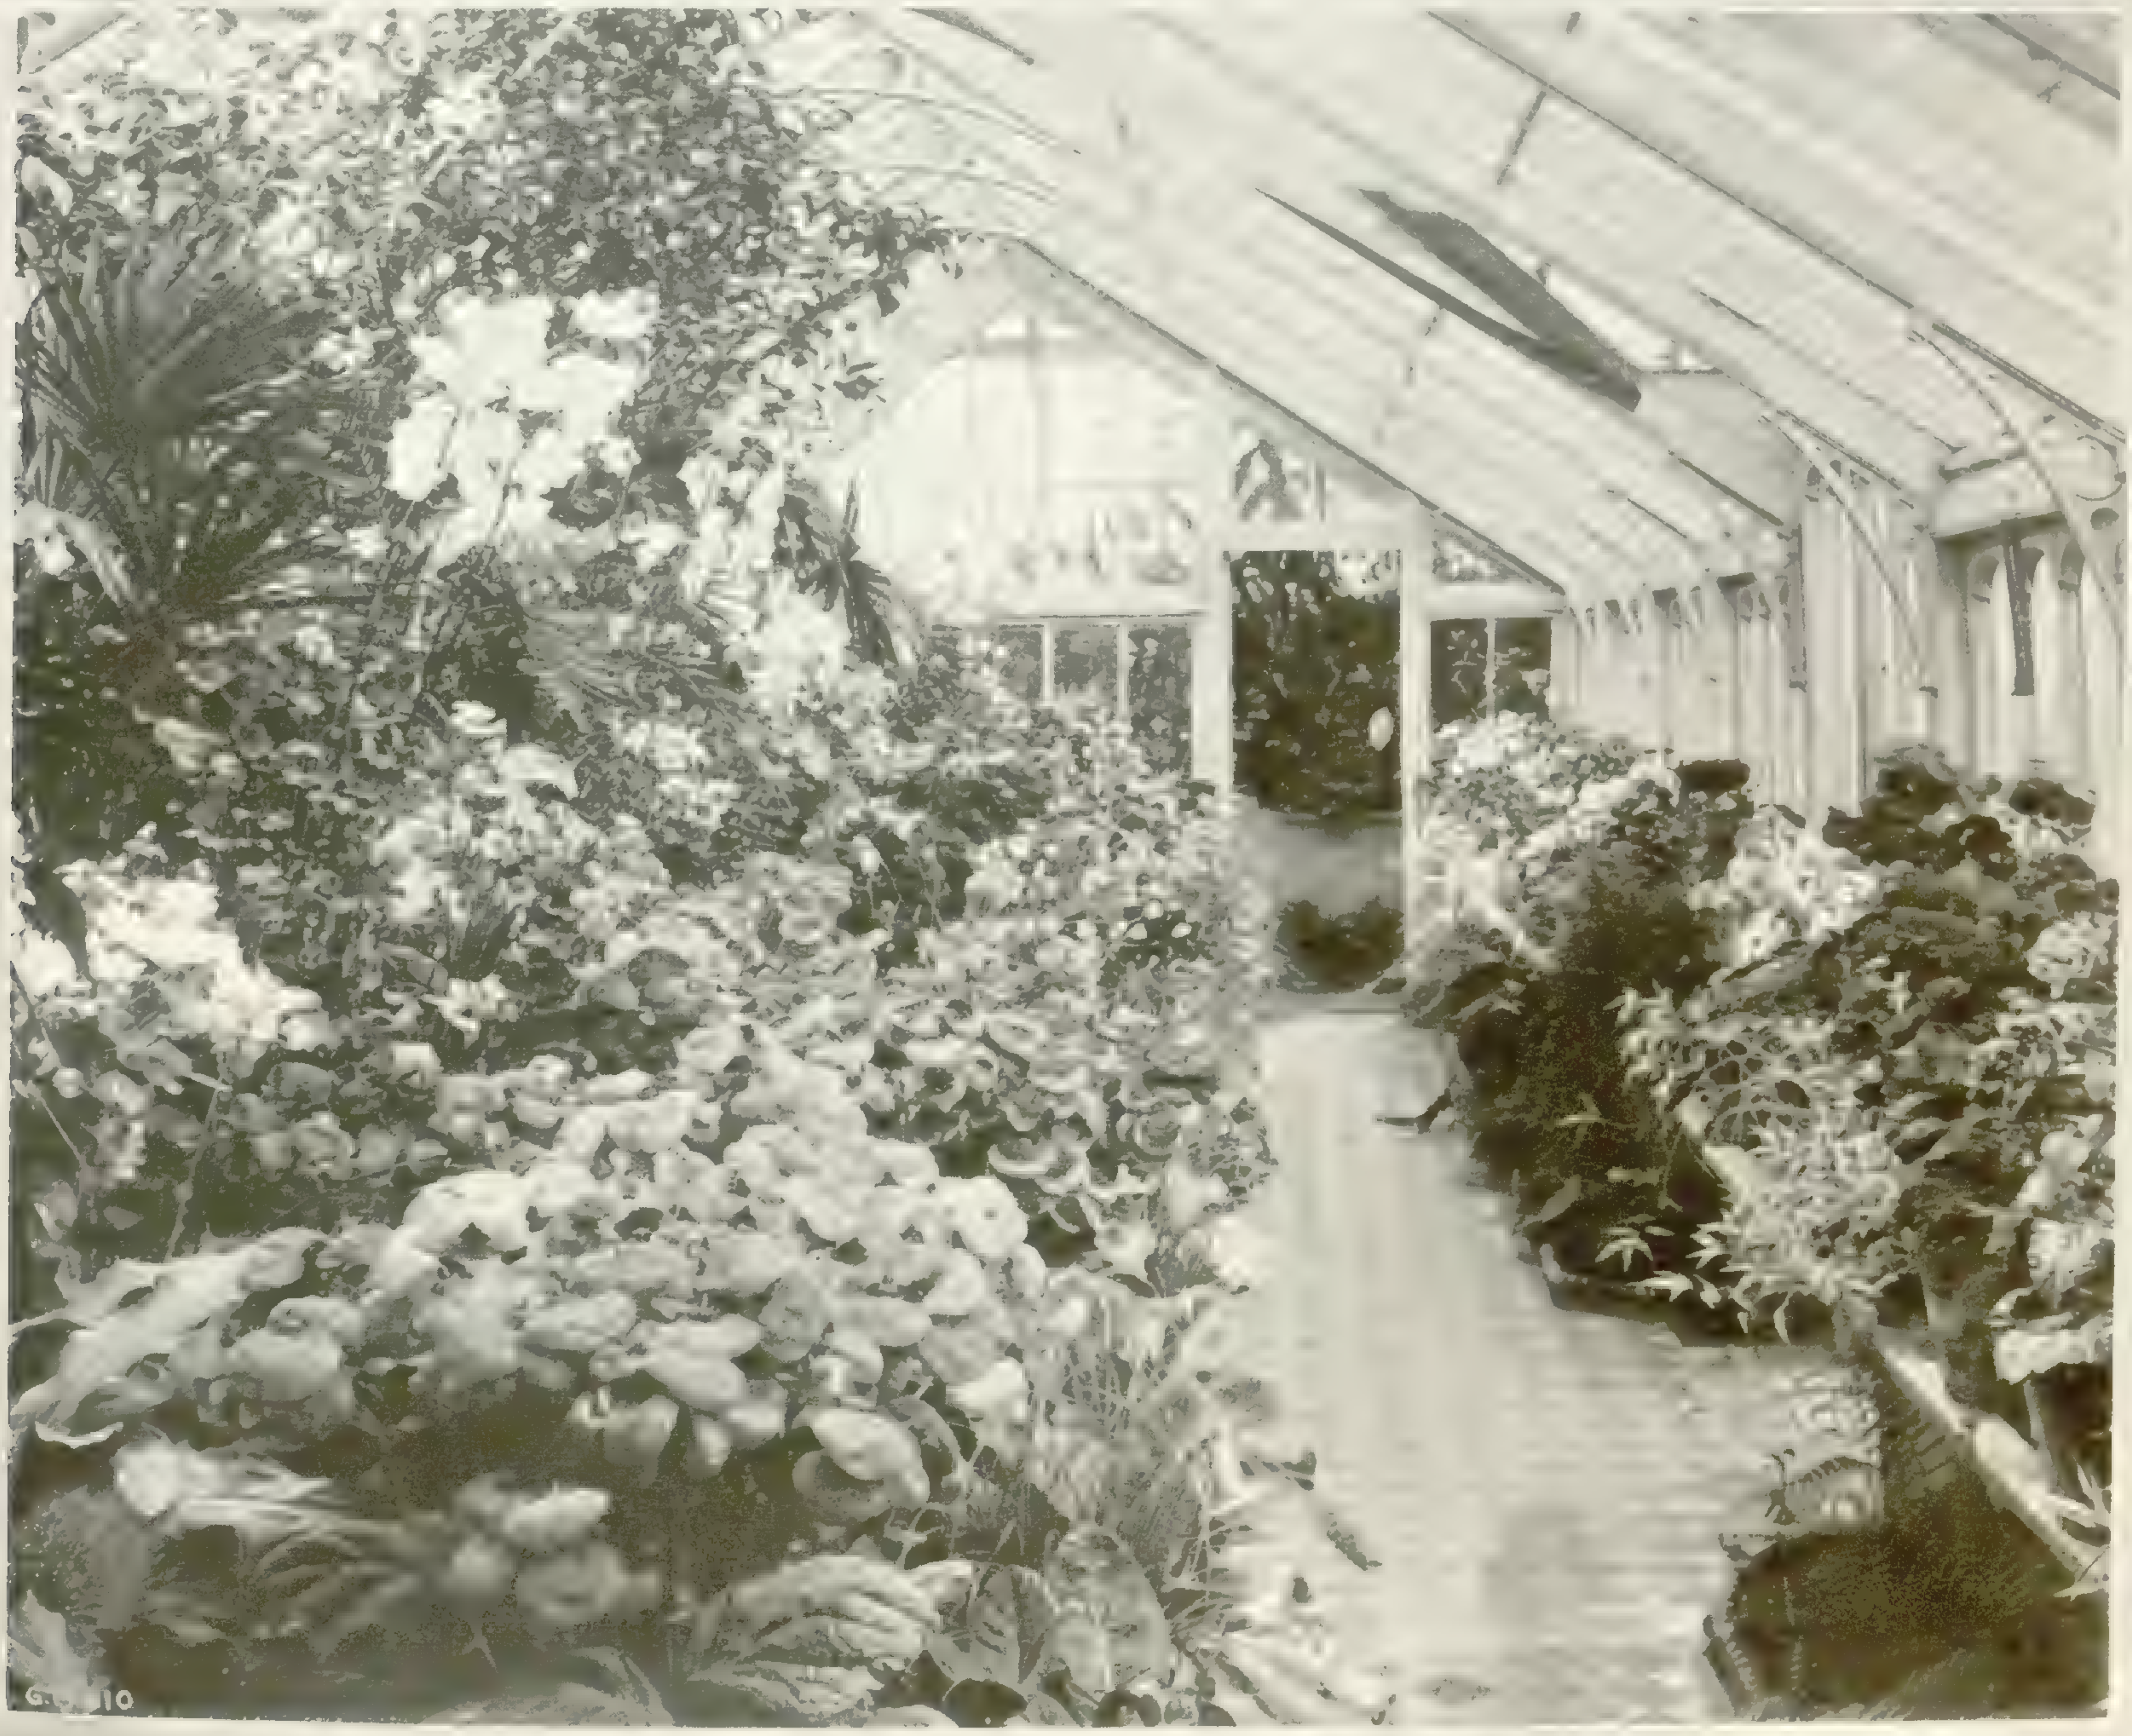
A beautiful and quite modern group of daffodils that are of incomparabilis size and form, and have the purity of the Leedsi varieties, has come to be designated Giant Leedsi, and the name is a good one so far as daffodil lovers and specialists are concerned, though the person with a passing acquaintance with daffodils might well be pardoned for wondering why the varieties in this group are not known or classed under White Incomparabilis. From the remark a good idea of the character of these beautiful daffodils will be obtained and a glance at the accompanying illustration will show the group is worthy of considerable attention. The variety figured is Lowdham Beauty, a large, bold, and yet very beautiful and graceful daffodil raised by Messrs. J. R. Pearson and Sons, Lowdham, Notts, and one for which they received an Award of Merit on the occasion of the visit of the Royal Horticultural Society's deputation to the Midland Daffodil Society's exhibition at Birmingham in April last. The flower is of large size and fine substance, white, cream-tinted, and with a pale shade of citron in the crown

BULBS.—A practical treatise on the cultivation of hardy, hothouse and greenhouse bulbous and tuberous-rooted plants is "BULBS AND THEIR CULTIVATION," by T. W. Sanders, price 2s. 6d. net, or by post 2s. from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

A WELL-FILLED COOL CONSERVATORY.

Although the gardens at Barnsley, Teignmouth, are not by any means the largest in this southern watering-place, they are well known locally for their good upkeep and for the admirable manner in which Mr. Prince, who is Captain Paul's gardener, keeps the cool conservatory gay from January to December. The illustration herewith shows this conservatory as it appeared recently when the fine herbaceous calceolarias were at their best. The conservatory is 40ft. long by 18ft. wide, and is a light, elegant structure. At the back are tall camellias, while a big orange tree occupies a central position, and a few palms are introduced. At the time the photograph was taken pelargoniums were grouped directly in front of the evergreen plants, with tall white Campanula pyramidalis rising among and above them. The foreground consisted of fine herbaceous calceolarias, while gloxinias, carex, and grasses provided an edging to the whole. The front benches were filled with calceolarias, pelargoniums, marguerites, and Rex begonias.

Mr. Prince sows his campanulas at the end of March in a cold house, and plants the seedlings out of doors as soon as they are large enough, lifting and potting them up in October for flowering the following spring. The calceolarias he sows about June 16, in a moist atmosphere, and a temperature of 55 deg. to 60deg. The seedlings are transferred to boxes and from thence are potted off in several batches, the largest plants eventually flowering in 8in. pots.



A WELL-FILLED CONSERVATORY AT BARNSLEY, EAST TEIGNMOUTH, THE RESIDENCE OF CAPT. PAUL.

FRENCH PLANT "CREATIONS."

The French gardening paper, "Le Petit Jardin," envious apparently of the reputation of Luther Burbank, and unwilling to believe that America could so far excel La Belle France in invention as the American Press notices imply, has set to work to find, and apparently has succeeded in finding, a worthy rival in a Monsieur Clotaire Durebanque, an amateur horticulturist in Marseilles, who, having been, despite his modesty, persuaded to grant an interview, has described and exhibited a large number of new "creations" of his own. As these "creations" are depicted, ostensibly from photographs, their wonderful nature is easily grasped, and it is abundantly obvious that the American "creator's" laurels are seriously threatened.

The first example, Echinocereus dahliæflorus, a cross between a cactus and a dahlia, shows a thick, spiny excrescence, crowded with typical cactus dahlia blooms. A new podless pea is shown, with the peas suspended like bead necklaces, stripping off only being necessary for the pot. Cyclamen papilio is improved by the addition of the bodies and antennæ of the butterflies with fine effect, while the objectionably stringy nature of the French bean is amediorated by the strong "string" appended as a slender tail, so as only to require severing, the bean proper being devoid of one. A turnip surmounted by a fine cauliflower borne on a well-developed mass of Brussels sprouts is another "creation" worthy of a great raiser. The climbing strawberry is another triumph; as depicted, strawberries a pound or two in weight, hang suspended from a sturdy vine trained along a high wall, a transformation effected by M. Durebanque in order, as he says, to avoid the slug and the weed from straw litter as well as a preventive of "lumbago" and other varieties of back-ache involved in picking berries from the ground.

An amusing picture shows an explosion of a large frame, due to sudden growth of enormous carrots, owing to an overdose of patent manure. It is, however, perhaps in the direction of the chrysanthemum that the greatest ingenuity of the French "creator" is evinced, since in "les chrysanthèmes à perruques," or Wig Chrysanthemums, we see depicted close imitations of such marked types of "chevelure" as Paderewski's, Sarah Bernhardt's, Ibsen's, Gorki's, and others. The letterpress describing these marvels descants particularly upon the modest and retiring nature of the man to whom the world owes these marvellous inventions, and the ideas which inspired them; but, despite the graphic character of the descriptions of both the "creator" and his "creations," there is throughout such a suspicion of satire, that we are persuaded the date of the record, April 1, is appended with a purpose.

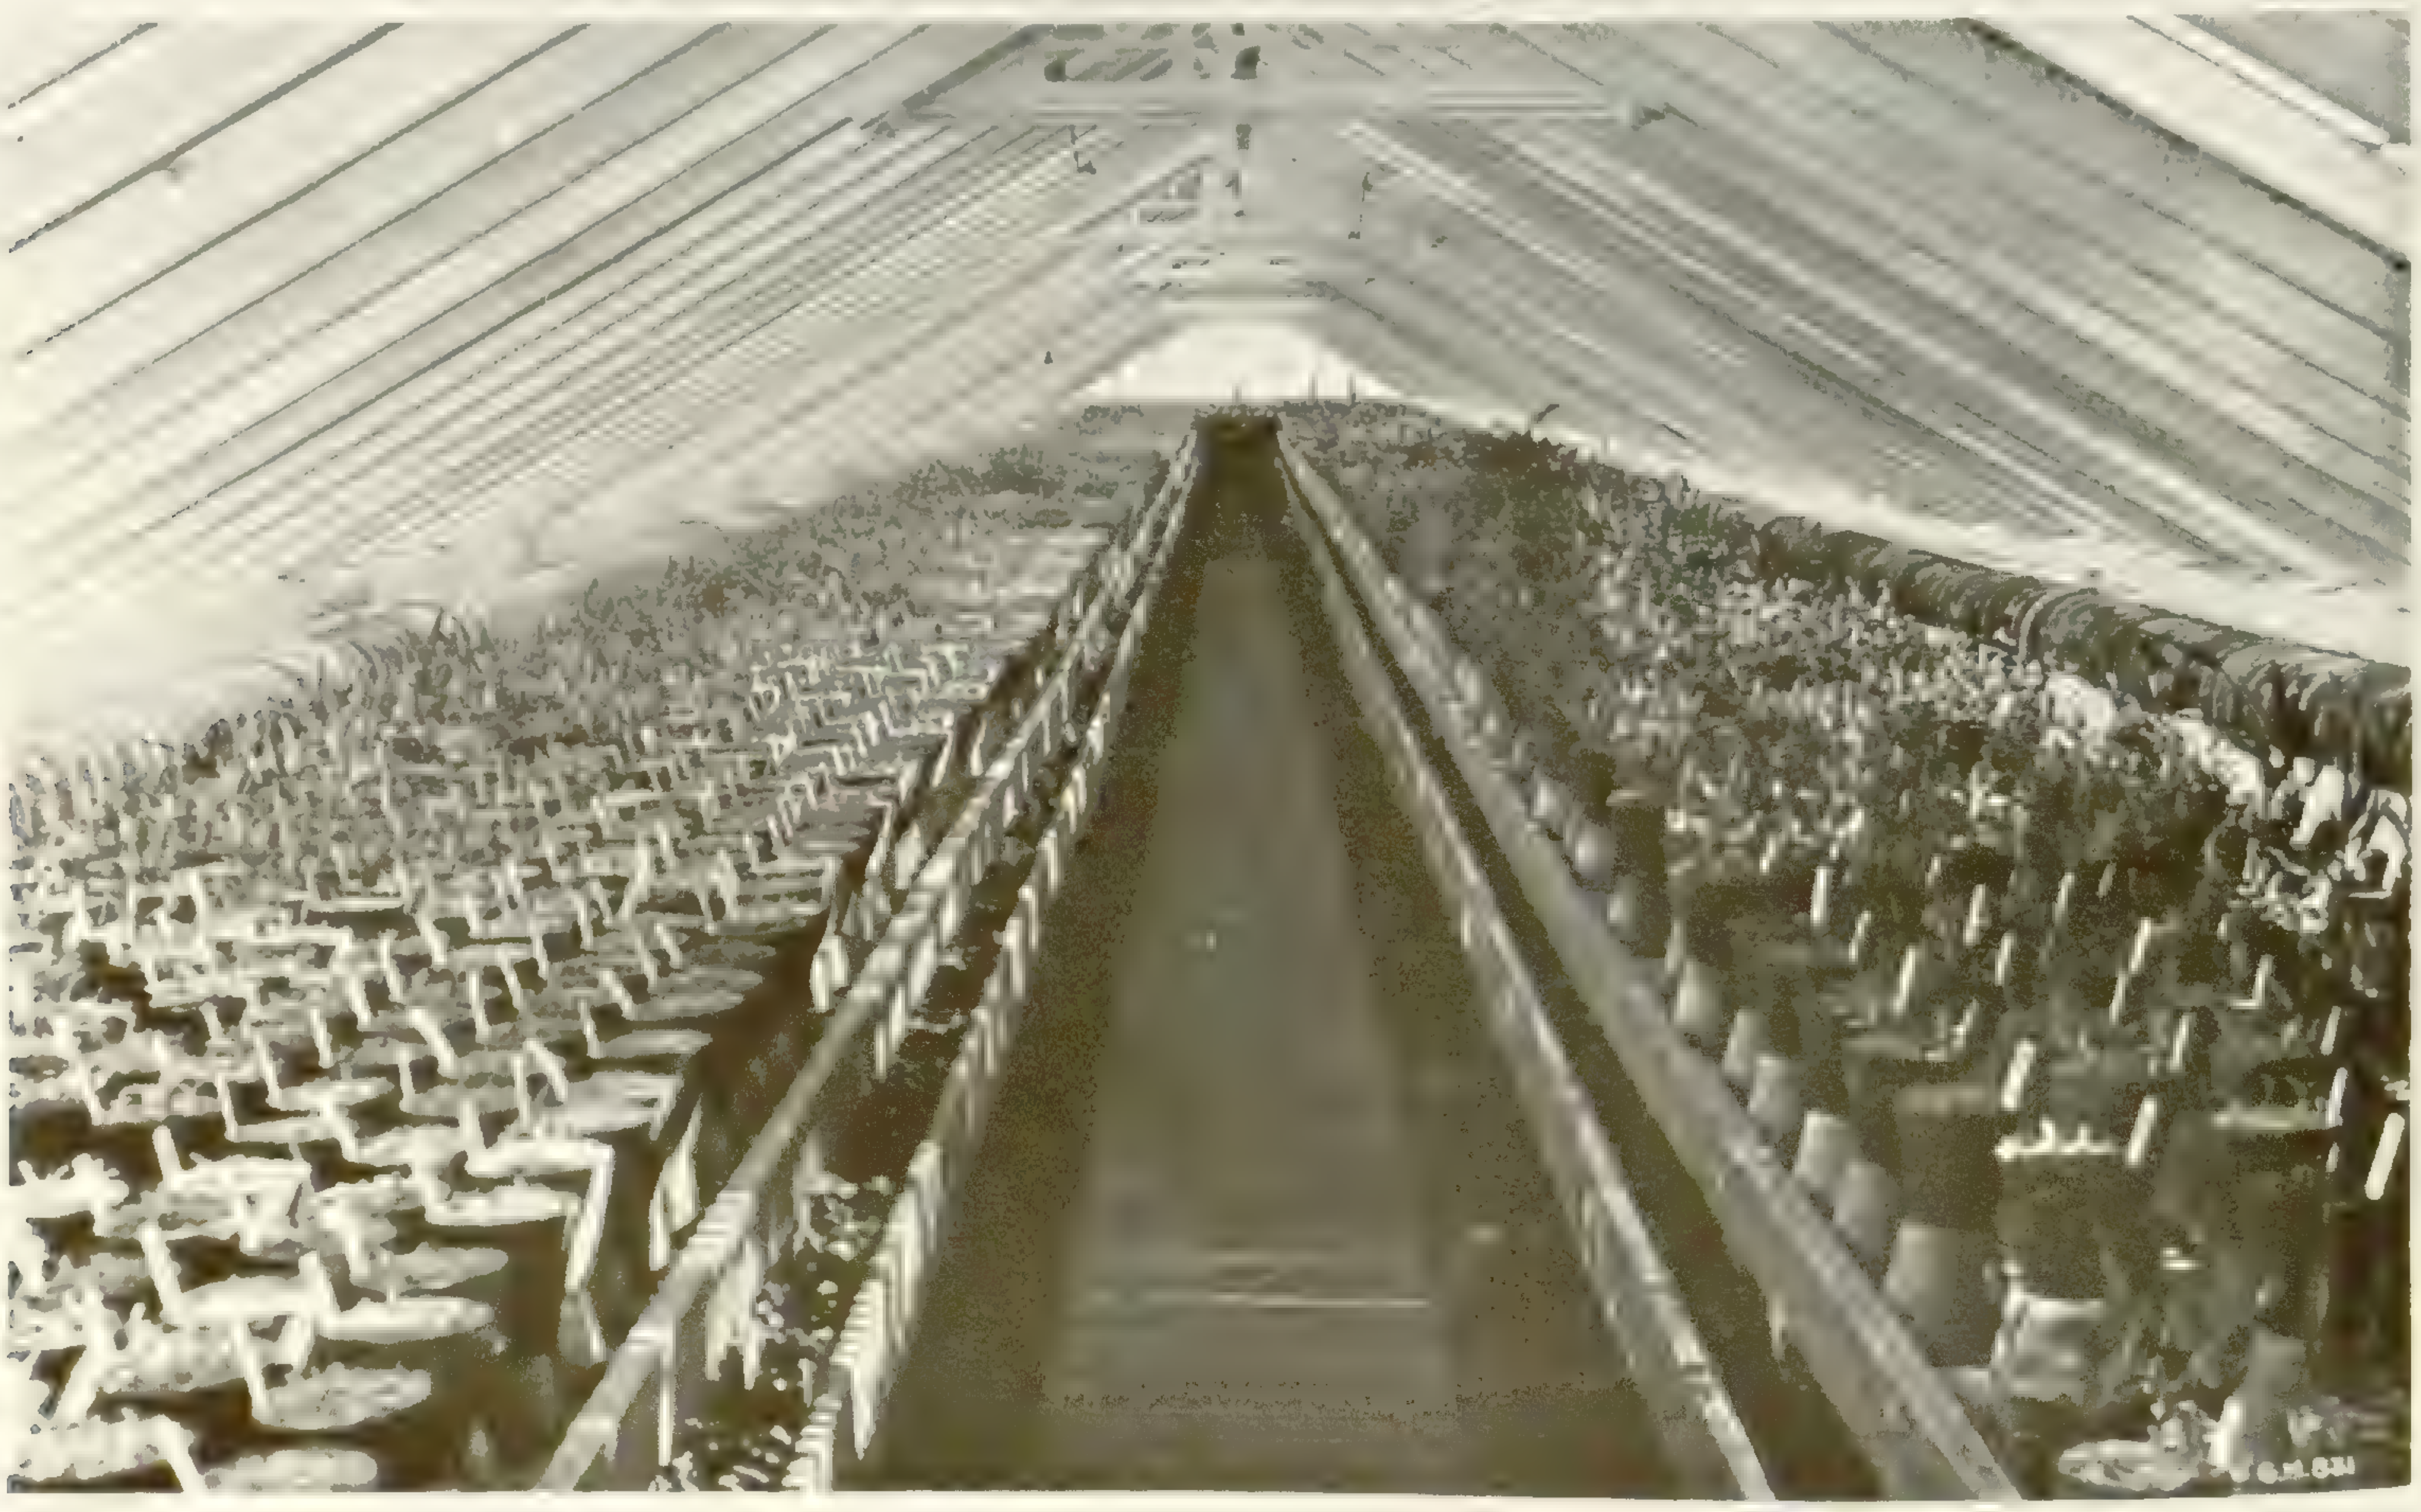
C. T. Druery.

MESSRS. CHARLESWORTH AND CO.'S NEW NURSERIES.

The progress of orchid cultivation in private gardens has been marvellous during recent years, and, though the number of those who make a very special feature of orchids is necessarily limited, the number of those who cultivate a modest collection of these floral aristocrats is very large indeed, and steadily increases. Evidence of the increasing popularity of orchids is to be found in the many exhibits staged fortnight after fortnight at the Royal Horticultural Hall, the splendid displays at the Temple Show, the regular displays at Manchester, and also at Ghent, the great Belgian centre. Further evidence is found in the great interest visitors find in these exhibits, their anxiety to understand the best methods of housing and culture, and their desire to select those kinds that are beautiful and useful, as distinct from those that may be equally attractive, but not so serviceable, or may be more quaint and interesting than beautiful.

A WELL-EQUIPPED PACKING SHED IN MESSRS. CHARLESWORTH AND CO.'S NURSERIES.

The development of commercial establishments where orchids alone are grown is a comparatively modern one, whereas formerly the orchid department was one of many in a well-appointed nursery. Among those who have specialised in orchid importation, orchid culture, and orchid hybridisation, and left other subjects severely alone, Messrs. Charlesworth and Co. stand in an especially prominent position. N so very long ago they had a nursery at Heaton, Bradford, but this soon became t small for the proper housing of the rapidl increasing stock of seedlings of hybrid origin, and the splendid batches of new a rare species, and so a new establishme was acquired especially for the hybrids a varieties. In process of time these tw nurseries became inadequate to meet th demand created by the regular exhibitio of new, beautiful, and useful hybrids, a home-raised varieties of odontoglossums etc., and, feeling that the southe with their additional light and might prove more beneficial than the spheric conditions prevailing at Brad Mr. Charlesworth secured a small nurs



A HOUSE OF SEEDLING ORCHIDS IN MESSRS. CHARLESWORTH AND CO.'S NURSERIES.

at Haywards Heath in Sussex, and there for a few years experimented with seedlings and importations. So great was the success obtained that he resolved to launch out on a large scale, and build an establishment that would provide these conditions long practice and experiment had proved most suitable for the delicate seedlings or the robust species.

A farm was taken at Haywards Heath, about three miles from the station, and here, under Mr. Charlesworth's direction, Mr. Harris, of Ealing, has constructed what must be regarded as the most up-to-date orchid nursery in the world, and one that probably is also the largest devoted entirely to orchids. A broad grass-bordered road leads from the entrance up to the handsome suite of offices and reception rooms, and one may step from carriage or motor car on to the low, glass-covered verandah, and then pass through every house on the place, all filled with orchids, and return to the verandah again, without once going out of doors. At the end of the verandah a glass-covered way leads to the broad, handsome, tiled corridor that links up the big commercial block, consisting of a dozen houses, six on either side. The corridor is 250ft. long, and the houses are 100ft. long each, varying from 12ft. to 21ft. wide.

By passing through the potting and packing sheds, all splendidly appointed and capable of dealing with very large quantities of orchids, the other large block of nine houses, each 100ft. long, two houses 35ft. long, and a sort of sanctum sanctorum, containing very special plants used as parents in the work of hybridising, measuring 50ft. by 18ft. is reached. This block has also its corridor, and the whole is so arranged that without any rearrangement the establishment could easily be doubled in extent.

At the rear of the houses and the potting and packing sheds are the two stoke-holds, where Foster and Pearson's Senior Robin Hood boilers are installed, and there is ample room for two more big boilers in each. Beyond these, across the broad yard, are the pot and compost sheds, stables, electric plant, etc., etc., There is telephonic connection between each department and the offices, an ample water supply, and enormous tanks for rain-water storage, and workshops for the making of lath blinds and repairs; indeed, nothing seems to have been left undone in the way of thorough equipment from the business, cultural, or visitors' points of view.

These pages have testified so often to the great advances in orchid hybrids that Messrs. Charlesworth and Co. have produced, that it is not necessary to enter into detail concerning this most important branch of their work. One may safely say, however, that even those familiar with orchid establishments would be greatly astonished at the hundreds of thousands of seedling orchids, hybrids, and cross-breds to be seen here in all stages of development, from the germinating seed up to the flowering specimens. Odontoglossums figure the most extensively in the seedling houses, and there are thrifty batches of hybrids between widely differing species, and many healthy groups of plants that represent some daring bigeneric cross. Odontiodas are quite common, and lælio-cattleyas and cattleyas fill several houses. Compared with other seedlings cypripediums are not so largely represented as might have been expected. There are many oncidium hybrids, and some crosses between odontoglossums and oncidiums that promise well. In the matter of odontoglossums it is almost impossible to suggest a combination that Mr. Charlesworth has not made, while varietal forms of O. crispum and of popular odontoglossum hybrids are being raised in quantity, and in every case none but the finest forms have been used as parents. The secondary odontioda hybrids and the sophro-lælias and sophro-cattleyas form other interesting batches. One thing is forcibly borne in upon one after an inspection of the seedlings, and it is that Messrs. Charlesworth and Co. have not the slightest fear of any falling off in the interest and culture of orchids for many years to come.

In the commercial block of houses home-raised varieties of Odontoglossum crispum, finely blotched, O. Phœbe, O. amabile, O. Lambeauianum, O. Armainvilliersense, O. ardentissimum, O. Rolfæ, O. Wilckeanum, O. Ossulstoni, and many another beautiful kind is represented by fine plants, many flowering freely. The cypripediums are largely grown, and especially good is the collection of the cool-growing varieties and hybrids, although the warmer-growing kinds are by no means overlooked. The lælio-cattleyas are a fine sight, even when not in bloom, and there are grand plants and big batches of the beautiful L.-c. Charlesworthi, L.-c. Iris, L.-c. Aphrodite, L.-c. Canhamiana, and L.-c. Martineti, to mention no others, all in the rudest health. Brasso-cattleyas form another large group, and cattleya hybrids include all the finest kinds. Cattleya species and dendrobiums are abundant, and among the former C. Mendeli, C. Dowiana, and C. gigas attracted special attention. Although phalænopsis did well at Heaton, they grow and flower still better at Haywards Heath, and it does not seem possible to find finer batches or plants of P. Rimestadiana, P. Schilleriana, P. Stuartiana, and P. amabilis than are here, and with them are several rare hybrids and varieties.

One must pass over the epidendrums, the brassias, the house of Trichopilia suavis, and the re-introduced T. Backhousiana, the vandas, and the oncidiums, and even the specially fine collection of masdevallias, bulbophyllums, and a host of small flowering but very pretty or quaint, and entirely interesting species that appeal so strongly to the horticulturist who has a weakness for the botanical as distinct from the floricultural side of orchid study, and conclude by stating that no one interested in any way in the cultivation of orchids should fail to see this new and splendid establishment. It is a noteworthy addition to a special department of our great and growing national horticultural industry, and as such it deserves and merits more than a passing thought—it needs a visit to properly understand it.

A SPACIOUS POTTING SHED IN MESSRS. CHARLESWORTH AND CO.'S NURSERIES.

HARDY FLOWERING TREES AND SHRUBS.

I do not remember seeing hardy trees and shrubs flower more profusely than they have done this season, for from early spring until the present time the different species and varieties have been in flower, making the garden most interesting. Though some of the more tender kinds suffered somewhat during the winter owing to the long spell of cold east winds and severe frosts, many were left uninjured, and these seem to have flowered more freely than usual. From the common holly, crab, wild cherry, and hawthorn, to the latest introductions, all alike have produced a wealth of bloom seldom before seen.

Where a good collection of flowering shrubs is grown there is usually something interesting at all seasons of the year. In spring and summer it may be the young growth or flowers which arrest the attention, while in autumn and winter the foliage or fruit renders them attractive. There are many species that are far more hardy than they are generally supposed to be, and though sometimes in very severe winters they suffer, it is usually owing to their being planted in unsuitable positions rather than to the severity of the frosts. Last spring the frost was very severe with us, for as late as March 5 we registered 36deg., which was most unusual for so late in the season, and the east winds were likewise bitterly cold for some days, but such shrubs as Enkianthus campanulatus, Eucryphia cordifolia, Carpenteria californica, Grevillea rosmarinifolia, Choisya ternata, and the like, suffered but very little, and these have been a mass of bloom.

Raphiolepis japonica at the present time is flowering most profusely. This is an evergreen shrub, having dark shining foliage, the short flower spikes standing erect on the terminals of the shoots just above the leaves. The individual flowers are white, somewhat resembling those of the kalmia in shape, and for a hard-wooded plant last a long time in perfection. Enkianthus campanulata is also another of those shrubs not generally found in our gardens. It was introduced some years ago by the Messrs. Veitch and Sons, and is one of the most beautiful free-flowering shrubs we have. It is a compact-growing plant, having small leaves, which are produced in clusters at the terminals of the shoots. The flowers are small, of a red shade, and borne in drooping racemes from the axils of the leaves, which render them objects of interest. This, no doubt, is one of the most interesting shrubs we have, and when planted in peat in a sheltered situation, soon makes a neat plant.

Escallonias are disappointing with us; some seasons they flower most profusely, and then, should the winter be severe, they die off. I have tried most of them, but without success, even when grown against a wall. There are, however, some charming things amongst the hybrid azaleas that are well worth attention, the varied colouring of the flowers in early summer, and the rich tints of the foliage in autumn commending them to all lovers of the beautiful. H. C. Prinsep.

Buxted Park Gardens.

THE ROUND-HEADED PHYTEUMA.

Phyteumas are not by any means common plants, and the efforts of cultivators to succeed with them have been largely directed to persuading P. comosum to flourish in their gardens, because of its singular beauty. As these attempts so frequently fail, they are apt to conclude that all the members of this genus are of the same character, and to think that it is well to leave them severely alone. This is unfortunate, as several of the phyteumas, including the subject under notice, P. orbiculare, are very easily cultivated, and will, indeed, thrive where P. comosum would perish in a short time.

It is hopeless to expect to grow P. comosum in the ordinary border of hardy flowers, but P. orbiculare is quite at home there, and it even appears to demand no special soil or attention to persuade it both to flourish and to flower freely. Of course, it is not by any means so quaint or so neat as P. comosum, but it is, withal, an excellent garden plant of an interesting kind. Its flowers, taken individually, are small, it is true, but they are plentiful, and as they are arranged in round heads the collective effect is by no means of little account. It is called the round-headed phyteuma, but this term is only appropriate during a portion of the life of the bloom, as the heads eventually become more oval than round by lengthening out into a kind of egg shape.

This phyteuma grows variously from six inches to a foot in height, and its presence near the base of the rock garden or in the front of the border is distinctly pleasing from the deep blue tone of the heads of flower. It can be grown in ordinary soil, and is free from the attacks of slugs most potent of enemies to its ally, P. comosum.

S. Arnott.

GREENING OF POTATOES.

Mr. George Massee, V.M.H., Assistant Keeper, Royal Botanic Gardens, Kew, contributes an illustrated article to the June issue of the "Journal" of the Board of Agriculture on this important subject, from which we take the following:

The "greening" of potatoes intended for "seed," which is brought about by exposing the tubers to light for some weeks before planting until the skin assumes a dark-green colour, is a practice that has been followed for many years, and is generally admitted to be productive of good results, although it is still too frequently neglected. The opinion of growers who consistently follow this practice is that the haulm or "top" is much more sturdy and robust than when the seed is not "greened," and this, as would naturally be expected, results in a better crop. Certain experiments have been conducted at Kew for the purpose of ascertaining in what particular manner "greening" proves beneficial.

Experiment No. 1.

Two batches, each consisting of twelve tubers of the variety called "Up-to-Date," and each batch having exactly the same weight, viz., 1lb. 8oz., were placed singly on a shelf in a room where they were exposed to a good light. The experiment commenced on August 25, six days after the tubers were lifted. One batch was covered with opaque black paper, the other batch was left exposed to light. The sprouts were constantly removed on their earliest appearance, and all the potatoes were turned over once a week. The experiment terminated on March 25. On weighing, it was found that the batch that had been covered with black paper had lost exactly 3½oz. in weight, whereas the batch that had been exposed to light, and had become thoroughly "greened," had lost barely threequarters of an ounce. Water probably accounted for most of the loss of weight; respiration would also be responsible for some loss; and the presence of sugar (Trommer's test) indicated a certain amount of activity in connection with growth.

In the following experiments, the kind of potato, the weight, and the duration of time were identical with those mentioned in the first experiment.

Experiment No. 2.

Both batches of potatoes were covered with black paper during the first five months of the experiment. During this period a certain amount of sprouting took place, the sprouts of the two batches weighing 2¾oz. At this stage the two batches, after the removal of the sprouts, were practically of equal weight. One batch was now covered with black paper, and the other batch left exposed to light, and in this condition they remained until the end of the experiment. The sprouts produced by the batch exposed to light averaged a quarter of an inch in length, and weighed a quarter of an ounce. The sprouts of the batch covered with paper averaged three inches in length, and weighed 1¼oz. The batch of potatoes that had been covered with paper throughout the experiment weighed 1¾oz. less than the batch that had been exposed to light during the last two months of the experiment.

Experiment No. 3.

At the commencement of the experiment, one batch was covered with black paper and the other batch left exposed to light. This condition of things lasted for two months, when it was found that the covered batch had lost 1oz. in weight, and the batch exposed to light had lost about 18 grains. From this stage both batches were covered with black paper, and remained so until the end of the experiment, when it was found that the batch that had been protected from light throughout the experiment had lost 3¼oz. in weight, including the sprouts, whereas the batch that had been exposed to the light for the first two months of the experiment lost just over ¾oz., including the sprouts.

The batch that had been protected from light throughout contained a considerable amount of sugar at the end of the experiment, and when cooked had the sweet taste and close texture characteristic of many potatoes in the spring; whereas the batch that had been thoroughly "greened" immediately after lifting was quite "floury" and normal.

Advantages of "Greening."

The time is now past when small potatoes, good for nothing else, were considered good enough for "seed." The general opinion held at the present day is that it is essential to have a good, firm tuber that has not been partly exhausted by loss of moisture and continued formation of sprouts that are broken off when the tuber is planted. As the above experiments indicate clearly, this result is better attained with "greened" seed than with seed not so treated. A potato not "greened" loses just over six times as much in weight during the season as a potato of equal weight that has been "greened." A potato that is "greened" in the spring loses twice as much in weight as a potato "greened" immediately after lifting in the autumn, other things being equal.

Effect of Action of Light on Growth.

Under similar conditions of temperature, light much retards the growth or sprouting of a potato, whereas growth is greatly favoured by darkness. The explanation of this difference of behaviour in light and darkness respectively is as follows: Before a potato can commence to sprout a certain amount of its starch must be converted into soluble sugar by means of a ferment or enzyme. Such enzyme can only be formed in a potato when there is a free interchange between gases formed in the interior of the potato and the atmospheric air.

An experiment proved that when the surface of a potato is coated with an impermeable varnish, except the "eyes," no sprouting takes place, even under the most favourable conditions for so doing.

The act of "greening" causes the skin or periderm of the tuber to become comparatively impervious to water and gases, hence the relative cessation of growth and loss of substance, whereas the periderm of a tuber kept constantly in darkness is not so impervious. The difference in amount of suberin present in the two cases is readily apparent on the application of tests for the presence of this substance.

The greatest amount of benefit derived from the "greening" of potatoes will be obtained when it is practised in the autumn immediately after lifting.

In addition to the advantages indicated above, autumn "greening" will, to a great extent, check the ravages of winter-rot, which often spreads in a wholesale manner after potatoes are stored, the fungus readily gaining admission through the soft skin of ungreened potatoes.

The short, sturdy, firmly-attached sprouts of "greened" potatoes do not break off during planting. The long, weak sprouts of potatoes kept in the dark have to be broken off before planting, as they are useless.

Hardy Climbing Plants.—There is now a great wealth of these, and when judiciously used on proper supports in the shrubberies, they form a pleasing feature, and do much to break up the formality of the planting. Such plants as loniceras of sorts, clematis, especially some of the hybrid varieties like Duchess of Albany, akebias, polygonums, ornamental-leaved vines, Rhus toxicodendron, and climbing roses are each suitable for this purpose. The growths will require frequent attention, regulating and tying them out, and during dry weather good waterings should be given occasionally. Unfortunately, insect pests of nearly all kinds have been most troublesome this season, and constant attention by way of syringing with insecticides, etc., has been necessary; not only does this relate to this kind of plants, but also to the great majority of trees and shrubs. Such subjects on pergolas, and trellises will also need attention.—E. Beckett.

PERPETUAL CARNATIONS.

The American carnation growers until quite recently did not believe in carrying their flowering plants over to the second year, it being generally conceded that the quality of bloom produced during the second season was not so high as that of the first. With stock grown and planted out on benches there is much truth in this statement, but many growers of carnations in the States now carry over part of their stock annually.

In the case of the British method of cultivation, in pots, the matter is different, the plants being so much easier to handle for the second year in the way of potting, and standing them out of doors for a short time during the summer. Consequently, many of our best growers do not throw away any of their flowering stock until after the second year, and the majority of varieties produce a higher grade of bloom and a larger crop during their second season.

The plant of Britannia illustrated is one of several plants exhibited from the Bush Hill Park Nurseries, Enfield, at the recent Temple Show; it was exactly twenty-six months old at the time the photograph was taken, was in a twelve-inch pot, and carried twelve flowers, 58 buds, and 192 flowering growths, while it measured four feet across the head, and had spent twenty months of its life in producing flowers which were quite up to the exhibition standard. It does not require much figuring to prove that more flowers are produced by two-year-old stock.

The main points to be borne in mind in carrying plants over is to grow them cool from the start, cut the flowers with long stems, so as to keep the plants dwarf, and not feed them with any kind of artificial manure you may have in stock, but use a good cool carnation fertiliser.

Montagu C. Allwood.
Royal Nurseries, Bush Hill Park.

SPARROWS AND GREEN-FLY.

I was very pleased indeed to notice Mr. G. Garner's short article upon this subject on page 497.

For a number of years I have observed birds closely, and often seen the much and wrongfully maligned sparrow eating many kinds of insects. The fact is he is a voracious and changeable feeder. From a butterfly to grubs and maggots of all kinds, he is by no means particular. I have watched these birds, and have seen them scoop the fly off with their open beak. "Scoop" is the only word I can find to describe the action. Our sweet and garden peas have been much visited by sparrows this season, and no damage done; while one need not watch long to see the birds with caterpillars in their beak. He cannot always have corn or fruit, and it is only natural he should take what is most plentiful and easiest obtained. Sparrows are condemned thoughtlessly by persons who have never studied their use in creation, and if they pick off the green-fly and maggots from my roses and sweet peas, they are friends of mine; at all events, while at that work.

Uckfield.

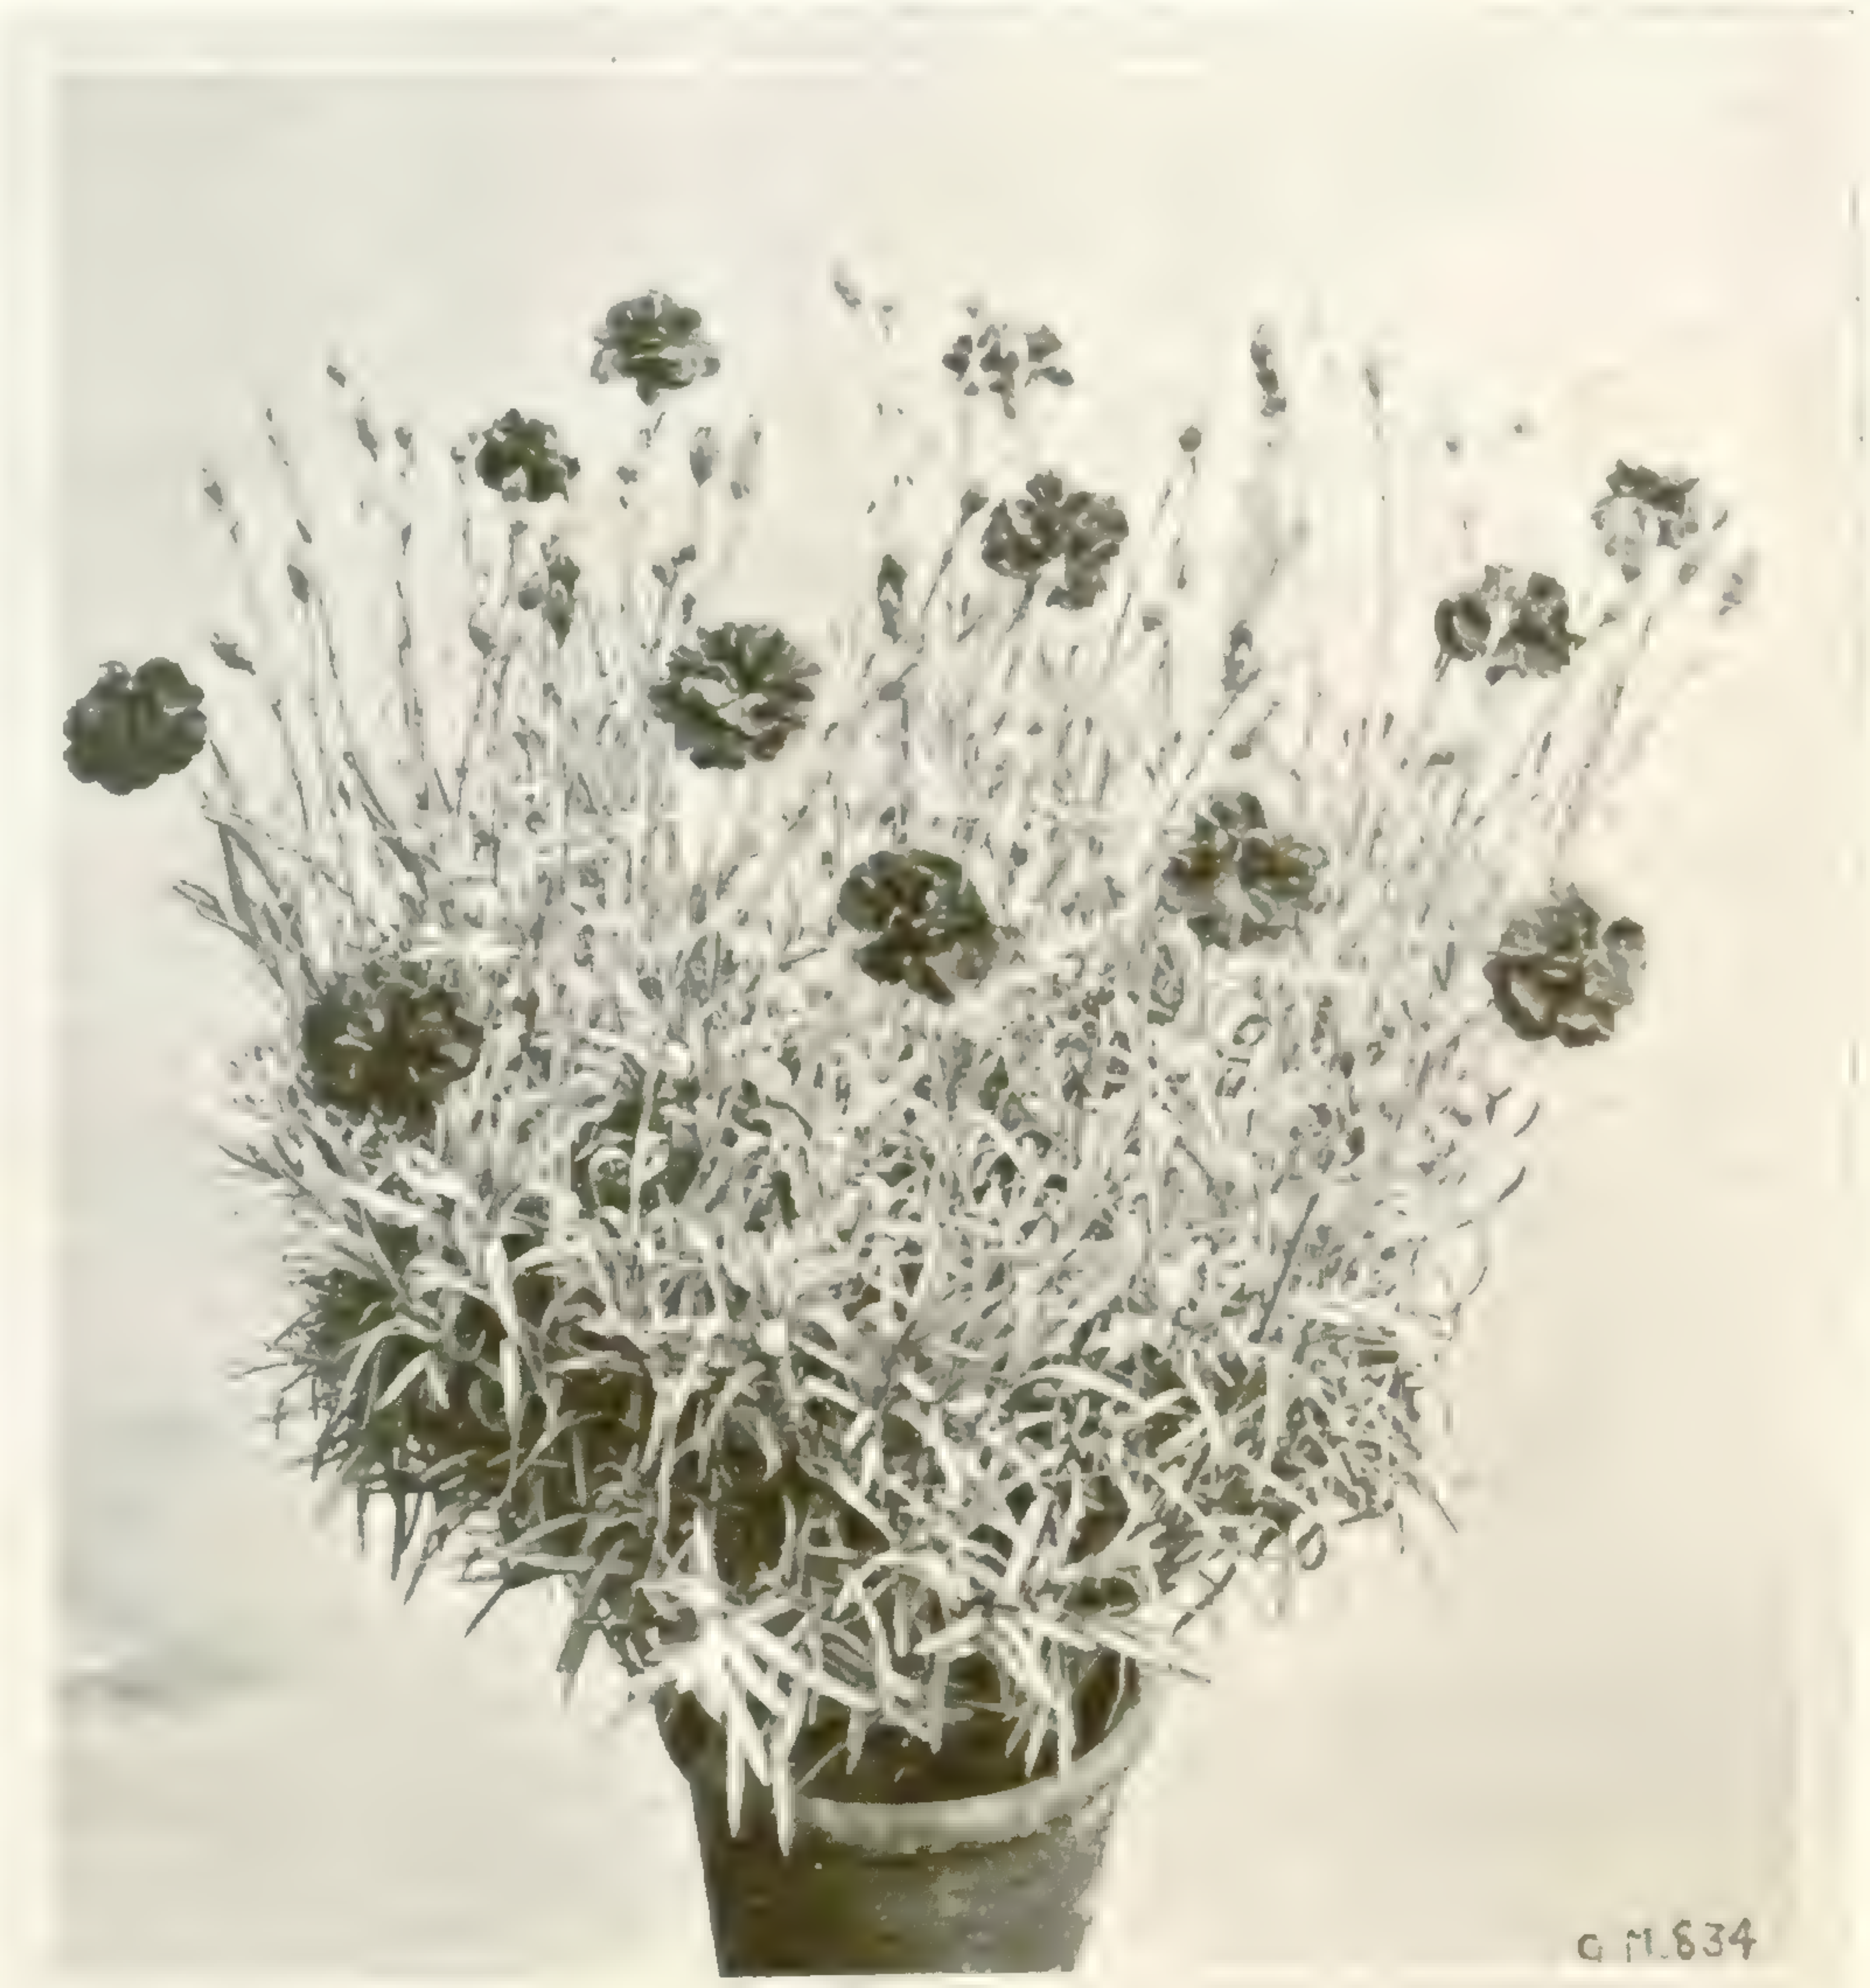
A. Piper.

Nitrogen in Rain. — Mr. Miller states that the total nitrogen in the rain collected at Rothamsted amounts to about [illegible] per acre per annum. The nitrogen in the form of ammonia amounts to 2.71lb., and the nitrogen as nitrates to 1.13lb., making together 3.84lb. of inorganic nitrogen. Determinations of organic nitrogen made by the late Sir Edward Frankland, showed that the rain supplies rather more than 1lb. per acre of nitrogen in this form. So that the total nitrogen, inorganic and organic, comes to about 5lb. per acre per annum.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

MILTONIA VEXILLARIA.—As the plants pass out of flower they should be placed under cooler and drier conditions, as it is upon proper resting, perhaps more than any other part of their cultivation, that success or failure to grow depends. If the conditions suitable to the requirements of the plants are found, there are few orchids that give a finer display or more rapidly develop into large specimens than M. vexillaria. I would advise that little or no root moisture should be given until the new growths are being produced. The longer resting period the plants obtain the stronger will be the new growths, so that no encouragement should be given. It is surprising to what an extent the resting conditions may be carried without any ill effects to the plants.



A TWO-YEAR-OLD SPECIMEN OF CARNATION BRITANNIA.
Grown at the Bush Hill Park Nurseries, Enfield.

THE POTTING SEASON of M. vexillaria is a subject that very few orchid growers are practically agreed upon. Some advocate annual repotting during the month of September, when the new growth commences, while others are in favour of deferring the matter until the spring of the year, at the time when the new pseudo-bulb is about to be formed, and the roots are being emitted from its base. As advocates of both methods can in most instances produce the same desirable results, they have every reason to abide by their opinions, but I should like again to point out that a great deal depends on the situation and conditions under which the plants have to be cultivated. I certainly should advocate spring potting in all cases where plants are grown in the immediate neighbourhood of London and other fog-laden areas and smoky districts. There are few plants that suffer more from the evil effects of fogs, and for that reason it is undesirable that the plants should be disturbed a few weeks previously to the winter season. If potting is done in the spring I have found the plants are much more satisfactorily dealt with. At this season of the year, where we have plants with several back pseudo-bulbs, the rhizome should be severed behind the second bulb. In most cases it will be found that the old bulbs possess dormant eyes, which, after the rhizome has been severed, will start into growth, and where the plants are repotted in the spring, these may then be removed if desired, and so the stock may be increased or the size of the specimen.

INSECT PESTS.—Yellow thrips are the most troublesome pests to be dealt with, and where the plants have been attacked during the past season it is well now to take every care to clear the plants before the new growths commence. Dipping at regular intervals is the safest method. The plants should be dipped twice a week where they have been badly attacked, and for three or four weeks after this spraying overhead at regular intervals of a fortnight should effectually keep the thrips in check. — H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

BEGONIA GLOIRE DE LORRAINE, and its various forms, should now be ready for their flowering pots, and 32-size is a very useful one for general purposes; if extra large plants are required, then 24's may be used, while all the smaller plants may be kept in 48's, and they will be found very useful where boxes and jardinieres have to be made up or filled for the house. Useful plants may be had even in 60's for the table. These plants are not over particular as to soil, so long as it is fairly porous, and a compost consisting of one part each of loam, leaf-soil, and part sand, with some wood ashes or charcoal added, will be found to suit them well. After potting they should, if possible, have a house to themselves, where a high temperature and a humid atmosphere, with plenty of shade may be maintained, giving but very little air until the plants are well into growth again; in fact, many people keep them growing without air until they commence blooming;

but such treatment is hardly necessary. Failing a house to themselves, they may be placed in a heated pit or on shelves in the melon or cucumber houses, or any other place where they get sufficient heat and shade.

WINTER-BLOOMING CARNATIONS.—These also will require to be put into their flowering pots, large 32's or 24's being large enough. A fairly light rich compost should be prepared for them, with plenty of wood ashes and lime rubble in it; pot firmly, and afterwards stake each plant and stand out a fair distance apart either in cold frames or under some temporary structure, where lights may be put over them in case of violent storms or prolonged wet weather, as there is nothing so detrimental to the well-being of carnations as excess of moisture soon after potting. If possible, the pots should be plunged to the rim in ashes, and if this is done, and watering very carefully attended to, it will be found that they will root and grow much more freely than when the pots are open to sun and air. Syringing must be regularly attended to, and unless the plants are wanted to bloom very early, the points of all strong shoots should be pinched out until the end of July.

MALMAISON VARIETIES that are intended to be grown on for another year should be potted as early as possible after flowering, using 9in. pots, and it will be wise to keep these steadily growing in a cool house, tying out the shoots so as to allow a maximum of air between them. Layering should be commenced at once, continuing this as the various batches of plants go out of flower, and the frames which have been used for early potatoes, beans, lettuce, etc., will be found very useful for them, the addition of a little fresh soil being all that is necessary. After layering, keep close and partially shaded for a time, syringing freely on all fine days, giving air as soon as rooting commences, and increasing it until the lights may be entirely removed.

SALVIA SPLENDENS should now be moved into 9-inch pots, or if extra large plants are required 12-inch may be used; after potting, stand the plants out in a good open position, and, except that they are not staked, I like to treat them just as I do the chrysanthemums. When well rooted into their flowering pots, pinch out the points of the shoots once or twice, but this must be regulated by the time they are wanted to flower.

AZALEA INDICA AND A. MOLLIS that have been kept indoors to finish their growth should now be in a fit condition to put outside, and I prefer to stand them where they will be partially shaded during the hottest part of the day, at least until the end of August, when they may have the full benefit of the sun. By treating them in this way the foliage will keep healthy. Place bricks or slates under the pots to keep out worms, and never allow the plants to become thoroughly dry. Plants of A. indica that have been repotted may need to stay inside a little time longer, when the same treatment may be accorded them.

LILIUM SPECIOSUM, L. AURATUM, and all other liliums, if not actually pushing their flower buds now, will be in active growth, and will require frequent applications of liquid manure to keep them strong. Fumigating must also be done frequently to keep them clean, and when a house is entirely devoted to them it should be fumigated at least once a fortnight, and tobacco paper will be found less harmful to the foliage than the more modern fumigants.—**Thomas Stevenson**, Woburn Place Gardens, Addlestone.

THE FLOWER GARDEN.

RHODODENDRONS AND HARDY AZALEAS.—The flowering season of these is now practically over, and to ensure a good growth and a free set of flower buds for next year the whole of the seed vessels must be removed by careful handpicking, and in case the beds were not surface dressed in early spring, it will be necessary to dress them now. Peat, leaf-soil, road sand, and half-decayed manure will form an excellent dressing at this season, and copious supplies of water should be given during spells of drought.

IVY.—This will in many cases need severe cutting, and by the autumn it should again be clothed with fresh green foliage. What a pity Hedera maderensis variegata is not planted much more largely. It is undoubtedly one of the finest silver variegated plants we have, and is extremely effective on red brick buildings. With us it has proved to be perfectly hardy even in the most exposed places.

SUBTROPICAL PLANTS.—These are now growing apace, and will need to be made thoroughly secure against wind by firm staking. Use broad, strong ties, and allow plenty of room for swelling. Keep the roots well supplied with water, and damp thoroughly overhead during the afternoon of hot days.

THE FLOWER BEDS AND BORDERS.—Attend to the staking and tying of the taller subjects, and low-growing plants which form a groundwork should be kept pegged down, with a view of covering the surface as speedily as possible. Remove decaying leaves and flowers, and stir the soil about geraniums, calceolarias, etc., just sufficient to break up the crust, present a fresh appearance, and allow the water to percolate evenly.

SEEDLING PLANTS FOR SPRING BEDDING.—Many of these will now be sufficiently advanced for pricking off into well-prepared soil, choosing as far as possible an open, sunny position; wallflowers require to be especially well grown and ripened, when they will be found to stand the winter satisfactorily. These should be put out at a distance of from twelve to fourteen inches all ways when quite small, and planted very firmly. Myosotis may be planted in more shade, and in a moister part of the garden. E. **Beckett**, Aldenham House Gardens.

HARDY FRUITS.

FRUIT PROTECTION.—Birds undoubtedly do an enormous amount of good, but still it cannot be denied that at certain seasons they are capable of doing a lot of damage by consuming or spoiling a large quantity of fruit, hence the necessity of planting such fruits as red, white, and black currants, gooseberries for dessert, raspberries, and strawberries in compact quarters, that means of protection may be easily, and at as little expenditure as possible, applied as it is required. Where much fruit has to be protected the cost of netting becomes a serious item of garden expense, so every endeavour should be made when placing the nets over the fruit quarters to keep them quite free from the trees, and not to allow a quantity to lay on the ground, or the netting will soon become useless. Light framework erected over the trees or beds on which to support the netting, with a piece of ordinary galvanised wire netting for the sides, makes a capital protection, and will add several years to the life of the netting.

SUMMER PRUNING.—Wall trees having been attended to, let those growing in the open be taken in hand. On bushes and pyramids the main shoots may be left from twelve to eighteen inches in length, according to the variety, with the laterals pinched back to within five or six leaves of their base; or, in other words, leaving them about six inches long. Unless growing strongly the leading growths on espaliers and cordons will not require shortening at this season, but all laterals should be treated as advised above.

RASPBERRIES.—Reduce the number of young canes to the proper quantity, and be careful not to damage these when picking the fruit, as the young suckers are very tender, and easily broken. A good plan is to run a piece of string up each side of the row, and loop it so as to act as a good support to the young canes.

BLACKBERRIES AND LOGANBERRIES.—These should have all weak suckers removed, and from two to four of the strongest of the young canes be tied loosely to the supports. Good soakings of diluted liquid manure will be found very beneficial to these plants, in assisting them to swell up the large quantity of fruit which they annually produce.

INJURIOUS INSECTS.—Woodlice and earwigs are often troublesome, and if not kept in check are very destructive to the ripening fruits of apricots, peaches, and nectarines, and if means are not taken for their destruction before they have tasted the fruit, it will be found a difficult task to trap them. A little dry hay placed in a small flower pot, and several of these pots laid down close to the foot of the wall, and examined every morning, will be found an easy and simple means of capturing a great number. Or take a few old potatoes and cut them through the middle, scoop out a portion of the interior, and place these, cut side downwards, on the border close to the wall; this will also be found an effective way of reducing the number of woodlice. The most successful means we have found of capturing earwigs is by cutting up bean stalks in one-foot lengths and placing these among the lower branches of the trees; a boy can blow these out each morning into an ordinary glass bottle containing a little paraffin oil, the latter assisting in their swift destruction.—**Geo. Woodgate**, Rolleston Hall Gardens.

NEW PLANTS, ETC.

ASTER MESA GRANDIFLORA.

A showy and useful hardy herbaceous subject, growing about 2ft. high, and making a neat bushy specimen. The flowers are from one to two inches across, shapely, a pretty shade of bluish-purple, with a silky sheen and with a central yellow disk. The flowering period is given as from June to September. A.M., R.H.S., June 22. Messrs. W. Cutbush and Son, Highgate.

DELPHINIUM MOERHEIMI.

This is an almost pure white delphinium, obtained by crossing D. Belladonna with D. sinensis. The tall spikes are not too closely set with flowers, and these latter are white save for a pale tint of green on the spur. A.M., R.H.S., June 22. Messrs. Cutbush and Son, Highgate.

PÆONIES.

Queen of Singles.—A very beautiful single white pæony with a big central boss of yellow stamens. A.M., R.H.S., June 22. Mr. Chas. Turner, Slough.

Leonora.—Another handsome single variety, having large crimson petals surrounding dull yellow stamens. A.M., R.H.S., June 22. Mr. Chas. Turner, Slough.

SWEET PEAS.

Stirling Stent.—A very fine new variety with bold, waved flowers of a rich salmon-orange shade. A.M., R.H.S., June 22. Mr. Jas. Agate, Havant, Hants.

Blanche Stevens.—The flowers of this smooth white variety are very large, the colour is very solid; for market purposes this should prove useful, but the flowers are rather too far apart on the stem, as shown, for exhibition purposes. A.M., R.H.S., June 22. Mr. H. J. Jones, Ryecroft Nursery, Lewisham.

CARNATION HER MAJESTY.

This carnation belongs to the heavy-edged picotee section, and is a particularly attractive variety. The ground colour is yellow and the margin is deep purple. A.M., R.H.S., June 22. Mr. Chas. Blick, Warren Nursery, Hayes.

CAMPANULA PHYCTIDOCALYX.

The broad flowers of this campanula are violet purple, and the inflorescence is [illegible] branched, and from one to two feet [illegible]. A.M., R.H.S., June 22. Mr. Bain, gardener to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking.

A. HARRIS,

Horticultural Builder, EALING, W.

Address..

CARDIFF AND COUNTY HORTICULTURAL SOCIETY COMING OF AGE SHOW.
SOPHIA GARDENS, CARDIFF.
WEDNESDAY and THURSDAY, July 21st and 22nd, 1909.
Most liberal prizes for this show.
MONEY, PLATE, etc., Amounting to about £400.
Many special features this year.
Schedules free to any address.
Mr. A. MAURICE BAILEY, Secretary.
24, Duke Street, Cardiff.

HANLEY PARK, STAFFORDSHIRE.
July 7th and 8th, 1909.

THIRTEENTH GREAT
ANNUAL FLORAL FETE.
£650 in Prizes. Silver Cups, Gold and Silver Medals.
SILVER CHALLENGE CUP, VALUE £10 10s.
offered for TRADE EXHIBIT (for particulars, see page 10 in Schedule).
Valuable Special Prizes offered by the principal firms in England.
The Railway Companies will convey Exhibits at one fare for the double journey, provided they remain the property of the Exhibitors.

Schedules post free on application to—
WM. POULSON, Secretary.
Town Hall, Hanley.

THE EDGWARE AND LITTLE STANMORE HORTICULTURAL SOCIETY.

THE ELEVENTH
ANNUAL SHOW OF ROSES AND SWEET PEAS,
On SATURDAY, July 10th, 1909.

The Society is affiliated with the Royal Horticultural Society, the National Rose Society, and the National Sweet Pea Society.
CUPS AND PRIZES TO THE VALUE OF £120.
The Military Band of the Metropolitan Electric Tramways will perform during the afternoon and evening.

ATHLETIC SPORTS AND OTHER AMUSEMENTS.

Schedules from
H. K. JUDD, Hon. Sec. Edgware, Middlesex.

WOLVERHAMPTON FLORAL FETE.
COMING-OF-AGE SHOW.
13, 14, and 15 July, 1909.
£900 in Prizes. Entries close July 5.
Schedules on application to the Secretary.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Brighton Rose and Sweet Pea Show.

JUNE 29 and 30.

The Brighton and Sussex Society altered the date of their show this season, and held a very successful gathering on the above dates in the Dome and Corn Exchange, with a small tent on the lawn outside. The opening day was wet, and consequently the light in the fine building—naturally rather heavy and dark—was by no means good. Roses and sweet peas were good for thus early in the season; carnations were excellent, and the table decoration class brought out a fine competition.

GROUPS.

Alderman Howlett's silver cup, a silver medal, and first prize for a circular group of plants, arranged for effect on a space 10ft. in diameter, were won by Mr. Edward Jones, gardener to H. Young, Esq., Withdean Grange, Brighton, who used caladiums, liliums, ferns, and odontoglossums freely, and had one central and four smaller cones of plants rising from a neatly furnished groundwork. Mr. G. Chandler, gardener to S. C. Witting, Esq., Hollingbury Copse, Brighton, was second, with a group consisting chiefly of beautiful maidenhair ferns, with carnations and begonias rising from them.

Premier award for a large group of roses, arranged for effect on a space 15ft. by 8ft., was won by Messrs. G. Mount and Sons, Canterbury (who also therewith won the champion cup for the best competitive exhibit in the show) with a grand display. In the back were pot plants and sprays of rambling roses, but the fine effect of the exhibit was secured by big stands of scores of noble blooms of Frau Karl Druschki, Richmond (fine colour), and Joseph Lowe: Mr. G. W. Piper, Uckfield, Sussex, was a good second with a very prettily arranged exhibit, but he lacked the weight of bloom carried by Messrs. Mount; Mr. E. Jones, Withdean Grange, third. The latter led for a group of ferns with a bold, undulating mound of nephrolepises and maidenhair ferns, all admirably grown.

There was only one table of roses in the open class, and here Mr. G. W. Piper, Uckfield, won first prize with a pretty arrangement of small tea and single roses.

The tables of sweet peas were all overcrowded; that is to say, there was too great a height and weight of flowers for the small 4ft. square tables. Mr. James Box, Lindfield, led, and his superstructure represented an airship; he had lovely blooms of Constance Oliver, Clara Curtis, Evelyn Hemus, Helen Pierce, and Etta Dyke; Mr. C. F. Waters, Deanland Nursery, Balcombe, second, with tall stands and small vases of mixed sweet peas; Mr. Paskett, gardener to E. J. Johnstone, Esq., Burrswood, Groombridge, third, with the finest blooms, but his stands were too conspicuous.

Mr. Paskett led for a table of carnations with splendid blooms, well arranged with Asparagus Sprengeri, and he therefore holds the Welsford-Smithers cup for this year; Mr. C. F. Waters, Balcombe, second with fine blooms rather stiffly set up.

In the amateurs' section, for a table of roses, Mr. George Chandler was first, Mr. Norman second, and Mr. G. H. Bennett, gardener to P. H. Bayer, Esq., Hatch Beauchamp, Withdean, third, but neither showed really well.

Messrs. G. Mount and Sons were also first for a group of roses arranged on a space 12ft. by 6ft., and here their stands of Mrs. John Laing and Liberty were very effective.

PLANTS.

Messrs. G. Mount and Sons were first for a dozen roses in pots, and Mr. Frank Woollard was second. Mr. Edward Jones won first place for six pot roses, and his were by far the prettiest set, his varieties being Hiawatha and Dorothy Perkins. Mr. Chandler scored for half a dozen fuchsias, and Mr. E. Jones led for a similar number of caladiums.

Messrs. Sutton and Sons' prizes for gloxinias were won in order by Mr. A. Bish, gardener to Miss E. Fitz-Hugh, North Acres, Streat; Mr. G. Chandler, and Mr. E. Jones. Mr. Chandler led for tuberous begonias, and Mr. Martin, 1, Mount Pleasant, Lewes, was a good second.

CUT BLOOMS.

In the open class for forty-eight cut roses, distinct, the premier award and gold medal was won by Messrs. G. Mount and Sons, Canterbury, who had a fairly good set, in which the best blooms were Antoine Rivoire, Rev. Allan Cheales, Liberty, John Cuff, Mildred Grant, Mdme. Ravary, Mrs. J. Laing, Richmond, Mdme. Jules Gravereaux, and Commandant Felix Faure. The second prize fell to Mr. Frank Woollard, Lewes Road, Brighton.

For thirty-six roses, distinct, Mr. E. M. Eversfield, Denne Park, Horsham, won the leading award and silver medal with some good flowers of Mildred Grant, Maman Cochet, Mdme. Jules Gravereaux, Mrs. Edward Mawley, Mons. Joseph Hill, Mrs. David Kee, Antoine Rivoire, Duke of Edinburgh, etc.; Messrs. G. Mount and Sons were second here, and Mr. Frank Woollard third.

The Messrs. Mount led for six bunches of long-stemmed roses in as many varieties, winning with Mrs. J. Laing, Richmond, Mrs. W. J. Grant, Joseph Lowe, Caroline Testout, and Mdme. Abel Chatenay; Mr. G. Norman, gardener to A. Morris, Esq., The Garden House, Upper Drive, Hove, second, and Mr. E. M. Eversfield third. Mr. Eversfield led for a dozen H.P. roses, and Mr. E. O. Hanbury, Amatold, Worthing, was first for six H.P.'s; while for a dozen tea roses Mr. Eversfield led, his Medea, Maman Cochet, and White Maman Cochet being very good. Mr. A. Boakes, gardener to Miss Lowe, The Lock, Hurstpierpoint, gained first prize for six tea roses with a good box, in which Corallina was conspicuously good.

There were but two entries of five blooms of a yellow rose, and here Mr. E. W. Morris, Uckfield, was first, and Mr. Eversfield second. For five white roses, long-stemmed, Mr. Eversfield was to the fore with Souv. de S. A. Prince, with Mr. Norman second. The best vase of five pink roses came from Mr. H. Macfadyen, gardener to L. Brenmeyer, Esq., Cuckfield Park, Sussex; and the best vase of red roses was of Hugh Dickson, staged by Mr. Eversfield.

Mr. James Box, Lindfield, Haywards Heath, was awarded first prize for two dozen vases of sweet peas, his best being of Mrs. Henry Bell, The Marquis, Gordon Aukentell, Clara Curtis, Princess Victoria, Henry Eckford, Lord Nelson, and Audrey Crier; Mr. A. J. Paskett, Burrswood, second. Mr. Paskett led for six vases of carnations with splendid flowers of Enchantress, White Perfection, Aristocrat, Mrs. Burnett, etc.; Mr. G. H. Simmons, gardener to H. G. White, Esq., Polegate, second; and Mr. Riley Scott third.

In the amateurs' section there were some excellent sweet peas, Mr. Paskett winning for twelve and for eighteen bunches, but here and elsewhere he omitted to name his fine blooms; Mr. Moppett, gardener to A. Carey, Esq., Downside, Roedean; Mr. J. Jeffs, Bates Road, Brighton; and Mr. C. W. Morris, Uckfield, were other prize winners.

Miss Mabel Howell, Tower Lodge, Queen's Park, Brighton, was awarded first prize for a table decoration in sweet peas; Mrs. Rapley, Havant, Hants, second, with blush carnations and pink verbenas; Miss Carberry, Highdown Road, Hove, third, with yellow marguerites.

FRUITS AND VEGETABLES.

Mr. J. Moore, gardener to Howard S. Johnson, Esq., Onslow, Worthing, had the only stand of Muscat grapes, and was awarded first prize. Mr. E. G. Pam[illegible], Brougham Road, Worthing, led for [illegible] grapes with Black Hamburgh well coloured; Mr. J. Moore second, and Mr. Macfadyen third. Mr. Macfadyen led for two dishes of strawberries with grand fruits of The Laxton and Royal Sovereign; Mr. Martin, Newick, second, and Mr. J. Reeves, gardener to Captain Acton-Blake, Pucks Croft, Rusper, third.

In the classes for a collection of vegetables Mr. Tourle, gardener to F. Barchard, Esq., Horsted Place, Uckfield, scored for six kinds; Mr. E. Jones led for salads, and Mr. G. Porter, gardener to Colonel Dudley [illegible]son, Buxshalls, Lindfield, led for nine kinds of vegetables, with Mr. M. Tourle [illegible] and Mr. J. C. Reeves third. Mons. P[illegible] Lecoq, French Garden Syndicate, W[illegible], was disqualified for showing more than [illegible] kinds, and he had a good collection.

NON-COMPETITIVE.

The non-competitive exhibits were numerous and good. Messrs. Barr and Sons, Covent Garden, contributed a goodly selection of pæonies, Spanish and English irises, [illegible] heucheras, anchusas, ixias, and other [illegible]ful things. Mr. G. Reuthe, Keston, [illegible] eremuri, pæonies, irises, gaillardias, campanulas, etc. Mr. Maurice Prichard, [illegible]church, had a very fine selection of [illegible] some beautiful delphiniums, including [illegible] exquisite Persimmon, Campanulas [illegible] irises, and a few alpines. Mr. J[illegible] Vale Bridge, Burgess Hill, Sussex, [illegible]buted a group of nicely grown [illegible] vexillaria, with a few examples of [illegible] Mendeli, C. Mossiæ, a few cyp[illegible] several Odontoglossums crispum of [illegible]

Pacho type. Mr. H. Ellison, West Bromwich, brought a group of the newer nephrolepis, gymnogrammas, and adiantums. Messrs. R. Wallace and Co., Colchester, showed Eremurus Bungei, some good liliums, campanulas, and kniphofias, irises, and a small collection of water lilies.

Messrs. Balchin and Sons, Brighton, filled a greater part of one end of the Corn Exchange with a beautiful group of Lilium Harrisi, arranged under a grand kentia and tall dracænas. The foreground consisted of hydrangeas, and the newer nephrolepises very prettily arranged. Messrs. J. Cheal and Sons, Crawley, put up a rock garden exhibit, vases of their pink lupins, and a small collection of sweet peas. Mr. James Box, Lindfield, Sussex, put up a very effective display of irises, poppies, delphiniums, liliums, gaillardias, and campanulas. Messrs. W. Miles and Co., Hove, showed a well-grown lot of ferns, foliage plants, and liliums.

Messrs. J. and A. McBean, Cooksbridge, showed a table of orchids, that included Cochlioda Noezliana and Odontoglossum Harryanum. Messrs. W. Wood and Son, Maresfield, showed roses, violas, and hardy herbaceous flowers. Mr. Riley Scott, Station Nurseries, Horsham, set up a delightful lot of violas, carnations, roses, and herbaceous flowers. The Barnham Nurseries, Barnham, showed a collection of roses.

Oxfordshire Horticultural Society.

JUNE 22.

Showery weather attended the 79th midsummer exhibition of this society, held on the above date in the delightful gardens of New College, Oxford - gardens with spacious lawns enclosed on two sides by the ancient city walls. Entries were fewer than usual, the cold northerly winds during nearly the whole of June having militated against the development of garden produce; but any lack in the competitive classes was fully made up in the non-competitive productions. As is generally understood, this society's June shows form one of the events of the festive "Commemoration" week at the close of the academic year in the university city; and despite the intermittent showers, was fairly well attended.

PLANTS.

The groups for effect, arranged on 220 square feet, were from Messrs. Cypher and Sons, Cheltenham, and Mr. W. Vause, Leamington, who had very artistic displays of palms, ferns, crotons, Japanese maples, dracænas, aralias, alocasias, marantha, coleus, intersected by Bermuda lilies, ericas, Clerodendron fallax, Miss Willmott verbenas, lælias, cattleyas, odontoglossums, miltonias, and other rich flowering subjects; Messrs. Cypher secured the £12 and Mr. Vause the £9 prize. Mr. John Walker, Thame, was strong with single and double zonal pelargoniums; and a collection of hardy ferns from Mr. H. Mount, superintendent of the University Parks, was regarded as being equal to anything seen in the district. Mr. R. Wadham, gardener to Mrs. Bradshaw, The Grange, Steeple Aston, presented some very fine gloxinias.

CUT FLOWERS.

Cut flowers proved an excellent section, there being very attractive displays of roses from Messrs. J. Mattock and G. Prince, each filling 72ft., and also several twenty-fours and eighteen tea roses; Mr. Mattock was first for a display, and Mr. Prince for twenty-four varieties. For eighteen roses the awards went to Messrs. F. Taylor and Sons, Kingham Nursery, Chipping Norton, and Mr. W. T. Mattock, Barton End Nursery, Headington, for very excellent blooms, in which the teas predominated. Messrs. F. Taylor and Son led for two dozen pansies, and Mr. J. Walker for a dozen triple trusses of cut zonal pelargoniums, pyrethrums, and irises.

In the open to all England division, Mr. John Johnson, The Nurseries, Garsington, arranged a noble display of perennials in about 100 varieties, filling one hundred feet run with sheaves of richly-coloured subjects; he securing the £3 prize, and also the premier award for a smaller collection. Sweet peas were very nicely posed in vases, Mr. T. Sirman, Stanton Harcourt, heading the list for a dozen bunches; and Mrs. Foster-Baird, St. Aidans, Rawlinson Road, Oxford, for nine varieties (Mr. R. Sydenham's prizes). Decorated dinner tables formed a feature, and in the open class Mr. T. Mattock led, his design being large spikes of Odontoglossum crispum. In the amateur division Mr. S. Mold (foreman cooper), Buckingham Street, Oxford, occupied the post of honour with a pretty and light arrangement of Aquilegia chrysantha.

FRUIT.

Fruit was somewhat limited, Mr. James Broadfoot, gardener to Mrs. Miller, Shotover House, presented very well-ripened Black Hamburgh and Foster's Seedling grapes; Mr. E. C. Munday, gardener to Rt. Hon. L. Harcourt, M.P., Nuneham Park, had the best nectarines and cherries; the Wick Nursery Company, Headington, sent remarkable large Kentish Fillbasket strawberries; and Mr. R. Wadham led in the classes for cucumbers, tomatoes, and a collection of vegetables.

In the amateurs' and cottagers' section a good average quality was manifest in plants, blooms, and vegetables.

For non-competitive exhibits a silver-gilt medal was awarded to Mr. J. S. Chidlow, gardener to Mrs. G. Herbert Morrell, Headington Hill Hall, for a collection of foliage plants, etc., covering 500ft. Silver medal to Mr. W. T. Mattock, for display of roses on 72ft; to Mr. J. Johnson, for a display of perennials and carnations; to Messrs. S. West and Sons, The Market, Oxford, for artistic floral designs; and to Messrs. Field and Jacob, The Market, Oxford, for a large number of artistic floral devices. Bronze medal to Mrs. Bradshaw, for extensive display of border flowers; to the Wick Nursery Company, for a large collection of decorative flowering plants; to Mr. Chas. Hayman, Old Botley, for boxes of very fine tea roses; and to Mr. H. Smart, The Market, Oxford, for forty dishes of fruit. Votes of thanks were extended to Mr. W. F. Cross (chairman of committee), Chilswell, Iffley Road, Oxford, for sixteen grand examples of British ferns in variety; to Messrs. Tucker and Sons, Brookside Nursery, Headington, for large collection of cut pæonies; and to F. Taylor and Sons, Kingham, for collection of Japanese maples.

Southampton.

JUNE 29 and 30.

On Tuesday and Wednesday last the annual summer show was held on the County Cricket Ground, and, considering the recent untoward weather experienced, was quite a success. The roses, it is true, showed some ill-effects of the untoward weather experienced of late, but they were of large size and fairly well coloured. Trade exhibits were very fine, adding much to the attractiveness of the show.

ROSES.

Eighteen classes were provided for these in the schedule, and, considering that the date did not clash with any other leading fixture, the competition was hardly so good as it should have been. For forty-eight distinct blooms there were but three entries. Messrs. B. R. Cant and Sons, Colchester, were distinctly ahead with large, well-developed blooms. The leading varieties staged were C. J. Grahame, Bessie Brown, Mrs. Theodore Roosevelt, Mildred Grant, Marquise Litta, Hugh Dickson, Mdme. Jules Gravereaux, Dean Hole, Captain Hayward, Frau Karl Druschki, Comte. de Raimbaud, Liberty, Hugh Watson, Joseph Lowe, Marechal Niel, Rev. Alan Cheales, Exquisite, and G. Laing Paul. Mr. Henry Drew, Longworth, Berks, was second, with Messrs. Jarman and Co., Chard, third. Messrs. B. R. Cant and Sons also occupied the place for twelve triplets, Bessie Brown, J. B. Clark, Captain Hayward, Mildred Grant, Mdme. Jules Gravereaux, and A. K. Williams were the most noteworthy. Mr. Drew and Messrs. Jarman and Co. were second and third respectively. Tea or noisettes, in twelve varieties, were well shown. Mr. Drew secured the leading award with medium blooms of The Bride, Mme. Jules Gravereaux, White M. Cochet, Mrs. Miles Kennedy, Medea, and Mrs. E. Mawley; Messrs. B. R. Cant and Sons second; and Messrs. W. H. Rogers and Son, Red Lodge Nursery, Southampton, third. Classes were provided for six blooms of one dark variety, and one light variety, but the exhibits were inferior, and the premier award was withheld, second and third only being given.

Garden or decorative roses formed a moderate feature, there being but little competition. For six bunches, distinct, Messrs. Jarman and Co. were first with Lady Gay, Laurette Messimy, etc., in good condition. In a class limited to local growers for six garden varieties, Mr. W. Valentine, gardener to H. E. Sugden, Esq., Ingersly, Chilworth, was first; Mr. H. Sivjour, gardener to Mr. R. S. Fairman, Rousham House, was second among five entrants. The premier H.P. or H.T. in the above classes was Dean Hole in Messrs. B. R. Cant's first prize stand of forty-eight. The best tea or noisette was White Maman Cochet, shown by Dr. Seaton, Woodside Cottage, Lymington. Amateurs and gardeners had several classes set apart for them. The Munt Challenge Cup was offered with a cash prize for eighteen distinct blooms. Mr. E. Percy Sugden, Uplands, Wimborne, was successful in obtaining this valuable award with a really good exhibit, White Maman Cochet, Mrs. Mawley, J. B. Clark, Dean Hole, Avoca, Lyon Rose, Captain Hayward, Mrs. Myles Kennedy, and Bridesmaid being the most noteworthy. The second award went to Dr. Charles Lamplough, Kirkstall, Alverstoke, and the third to D. Seaton, Esq.

For six triplets, Dr. C. Lamplough was first prize winner with desirable specimens of Hugh Dickson, Mme. Jules Gravereaux, and A. K. Williams; Mr. F. Slaughter, Steyning, Sussex, second. Teas or noisettes, in twelve varieties, single blooms, were best shown by Mr. Slaughter, Mme. Constant Soupert, Marie Van Houtte, and Mrs. E. Mawley were the best varieties. There were four competitors in this class.

In the smaller classes there was keen competition, Mr. G. Micklem, gardener to Alan Searle, Esq., Ashton Lodge, Bassett, won for twelve distinct. Mr. G. Hawkins, Alverstoke, second; seven competed. For two vases of roses, one dark and one light, arranged for effect, Mr. J. A. Fort, Winchester, won first prize.

PLANTS.

Miscellaneous plants added materially to the interest of the show. For a group arranged for effect in a space of 10ft. by 8ft., Mr. T. Hall, gardener to Lord Swaythling, South Stoneham House, Southampton, obtained the premier award with a fair arrangement of suitable plants, in which schizanthus figured freely. Mr. F. G. Bealing, Burgess Street Nurseries, Southampton, had the best four ferns. Mr. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, was first for table plants.

CUT FLOWERS.

For twelve bunches of hardy border flowers, distinct varieties, Messrs. B. Ladhams and Sons, Shirley, Southampton, were distinctly ahead with a capital set, in which were Potentilla W. Robinson, Coreopsis Eldorado, Gaillardia superba, and Betonica superba; Mr. W. Palmer, The Nurseries, Andover, second.

Sweet peas formed an important feature, as is invariably the case at Southampton. No fewer than five seed firms offered prizes, and these were keenly contested. In competition for Messrs. Webb and Son's prizes for eight varieties, distinct, in bunches, Mr. Usher, gardener to Sir R. Baker, Ranston, Blandford, led the way with a grand exhibit. There were three other competitors, and Mr. Lees was second. For Messrs. Toogood and Sons' prizes for six bunches, Mr. Usher was first with a magnificent display, comprising blooms of such varieties as Clara Curtis, Helen Lewis, Prince of Asturias, Mrs. A. Ireland, Etta Dyke, and John Ingman. Mr. H. H. Lees, Warblington, Havant, was a good second, and Dr. C. Lamplough third.

In competition for Messrs. J. Carter and Co.'s prizes for six varieties, twelve stems in each bunch, Mr. Usher was again first with an equally fine exhibit. Mr. D. Grant, gardener to G. H. Kitchin, Esq., Compton End, Winchester, second. Mr. C. W. Breadmore provided the prizes for twelve bunches, distinct, and again Mr. Usher led the way with marvellous blooms. Mr. Lees was a good second, and Mr. Grant third. For one bunch of Sutton's Queen Mr. Usher was first, as also for one bunch each of Gordon Auckentell, Mr. C. W. Breadmore, Elsie Herbert, and Audrey Crier.

FRUIT.

Fruit was not plentiful, but that staged was of good quality. Mr. Ellwood won for two bunches of black grapes with good Black Hamburgh. Mr. L. Weston, gardener to L. Walker, Esq., Brockenhurst, won for two bunches of white grapes with Foster's Seedling. Mr. Palmer had the best peaches; Mr. Gregory, gardener to H. D. Broughton, Esq., the first prize nectarines. Strawberries were best shown by Mr. Hall.

VEGETABLES.

These were liberally provided for, and as a result they were well represented. Messrs. Toogood and Sons offered prizes for six distinct varieties. There were ten competitors, and Mr. Ellwood was an easy first with high-class dishes of tomatoes, Royal Kidney potato, Leviathan White onions, Duke of Albany peas, and good cauliflowers; Mr. B. Hollis, gardener to Major Chichester, Embley Park, Romsey, second.

Messrs. Sutton and Sons, Reading, provided a class for six distinct kinds, open, and also a local class for six varieties. In the former Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, obtained the premier place with a collection of high-class produce, comprising Perfection tomatoes, Gladiator potatoes, Magnum Bonum cauliflowers, Centenary Marrowfat peas, and Leviathan onions; Mr. Ellwood was a close second; Mr. Hollis third. The premier award in the local class was made in favour of the last-named. In competition for Messrs. J. Carter's prizes for six kinds, Mr. Ellwood was an easy first with really fine examples. Mr. Pearce, gardener to Mrs. Tragett, Awbury Danes, Romsey, second.

MISCELLANEOUS.

Trade exhibits were numerous and good. Gold medals were awarded to Messrs. Toogood and Sons for sweet peas, most tastefully arranged; Messrs. Sutton and Sons for vegetables, fruit, and flowers; Messrs. Ladhams for herbaceous plants and roses; Mr. Waters, Deanland Nurseries, Balcombe, Sussex, for carnations; and to Messrs. Oakley and Watling, Southampton, for floral arrangements, in which the baskets of roses were especially fine. Silver-gilt medals were awarded to Mr. C. W. Breadmore for sweet peas and carnations, and to Mr. Burnett, Guernsey, for carnations.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, June 22.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair); Sir J. T. D. Llewelyn, Prof. A. H. Church, Messrs. S. Pickering, W. Fawcett, W. Cuthbertson, J. Fraser, J. W. Odell, W. Hales, R. Hooper Pearson, J. T. Bennett-Poë, V.M.H., J. Douglas, V.M.H., A. W. Sutton, V.M.H., C. T. Druery, V.M.H., G. S. Saunders, H. J. Veitch, E. M. Holmes, F. J. Chittenden (hon. sec.), and Prof. Hugo de Vries (visitor).

JESSAMINE SHOOT WITH ADVENTITIOUS ROOTS.—Mr. G. S. Saunders showed shoots of white jessamine from a wall having large numbers of adventitious roots springing from all sides of nodes on the stem and occasionally from internodes. It was suggested that possibly the roots had become dry, and this had induced the plant to attempt to make roots at other parts of the stem. Mr. Pickering mentioned that the peculiarity of producing abundant adventitious roots appeared to be innate in certain varieties of apples, especially in Northern Spy, the variety so largely used for stocks in New Zealand, etc. Mr. Chittenden remarked that the same character was to be seen in the variety "Oslin," a variety long ago known as the "Burrknot," on account of the frequent formation of burrs upon the branches.

EXOTIC SOLANUM.—Mr. A. W. Sutton exhibited a flowering plant of a solanum, the seed of which had been sent him by a correspondent at Monte Video, collected in Uruguay, and called by him "a wild tomato." The plant was referred to the secretary for further examination.

MALFORMATIONS IN TRIFOLIUMS.—Mr. J. Fraser showed examples of Trifolium hybridum var. elegans (Lavi) with typical forms for comparison, collected at Coulsdon, Surrey, in which the pedicels were elongated, and the pistil elongated and stipitate. He also showed T. fragiferum, collected at Mitcham, with axial proliferation of the inflorescence, and T. dubium, in which the pedicels of the original inflorescence were many times branched and bore many capitula, the sepals showed partial phyllody, the stamens pistilody, the pistils, which were stipitate, showed phyllody, in many flowers axial proliferation was to be seen, and in some cases the capitulum became an elongated raceme.

FLOWERS OF STREPTOCARPUS MALFORMED.—Mr. J. W. Odell showed flowers of streptocarpus malformed in a manner similar to those exhibited by him last year (see "Journal R.H.S.," vol. xxxiv., p. cxii.). This is now the third year in which the plants have borne similarly modified flowers.

LARGE FLOWER IN APPLE. — Mr. S. Pickering, F.R.S., enquired whether anyone had noticed flowers of apples with very numerous petals. He had seen this season in the case of Bramley's Seedling a single flower (the only one on the shoot) which exhibited no sign of synanthy, which bore twenty-five petals, the stamens, etc., being well developed.

WATER LILIES DYING.—These, exhibited by Mr. Veitch, were referred to Mr. Saunders for further examination.

HELIANTHEMUM SPORTING.—Messrs. Barr sent an interesting sport of Helianthemum Golden Ball, a yellow variety, bearing branches producing double scarlet flowers in the upper part of the plant.

NOMENCLATURE OF MULTIGENERIC HYBRIDS.—Mr. Chittenden, the secretary, read the report of the sub-committee upon the nomenclature of multigeneric hybrids, the committee approving the recommendations contained therein. After being read to the Orchid Committee, it will be presented to the council for its approval.

CERTIFICATE OF APPRECIATION.—A Certificate of Appreciation was recommended to be awarded to Mrs. Scott-Elliott, of Teviot Lodge, Hawick, N.B., for work in connection with the hybridising of aquilegias.

The Horticultural Club.

VEGETABLE CULTURE AND COOKING.

On Tuesday, the 22nd ult., at the Hotel Windsor, under the chairmanship of Sir John D. Llewelyn, Bart., the usual monthly dinner of this club was followed by a most interesting address on the above subject by the veteran horticulturist, Mr. Alexander Dean, V.M.H., who preluded his practical remarks by a regret that vegetables were in these days so greatly subordinated to flowers at all our great shows, despite their immensely greater practical importance as food for mankind. In this fact, he found some sort of parallel between it and the predominance which sport and games have assumed of late years, as compared with more practical employment of spare time by the rising generation, the prosaic, but essential, being largely ignored in favour of the æsthetic and ornamental, or that which contributed to excitement and in some degree to ostentation. The cooking portion of his subject was quite a secondary one, but was not to be ignored in the practical aspect of life, since the proper preparation of vegetables for consumption was a material factor, and was far too much ignored.

In this connection, he mentioned several examples where the ordinary treatment of vegetables, such as parsnips and potatoes, tended far more to spoil them than to bring out their full virtue and flavour as attractive forms of nutrition. Despite, however, the trend of popular taste in the ornamental rather than the practical direction, the rural cultivator of vegetables persisted in recognising the greater value of vegetables as contributers to the staff of life, and the lecturer considered it to be an important step in the right direction that the National Vegetable Society was now being formed to encourage and promulgate this recognition on wider lines by placing the culture of vegetables, as it were, on an official level with that of flowers.

Mr. Dean mentioned in this connection the valuable results which had been here and there obtained by intelligent working men from their small allotments, results which proved that, worked on right lines, the available land for such culture was sufficient to render Great Britain entirely independent of imports of culinary vegetables from outside sources. The profit obtained from small fractions of an acre proved in numerous cases to be practically such that vegetables to the value of many millions per annum could be produced by the working population, conducing not only to their personal support and that of their families, but, at the same time tending to reduce that constantly-increasing tendency to drift towards the cities and towns which so largely devitalises and pauperizes the nation.

Much is being done in this direction by means of corporate education in gardening, and Mr. Dean, as a judge of allotments to the Surrey County Council, was naturally well qualified to dilate upon this point; he felt, nevertheless, that it was a matter of great congratulation that the Duke of Portland had accepted the presidency of the new society, the National Vegetable Society aforesaid, while, as a result of his present address, Sir John Llewelyn had consented to be one of the vice-presidents. He also expressed his acknowledgment of the great debt which the cultivators of vegetables owe to the seed trade, which, with true commercial foresight, had done so much by careful selection and improvement to raise the standard of culinary vegetables, and to secure that the seed supplied should give, with proper culture, the best results.

In the subsequent discussion, participated in by Sir John Llewelyn and Messrs. [illegible], Langston, and Pinches, the lecturer's remarks anent the healthy spread of gardening education were fully endorsed, its tendency to reduce the drift of rural life townwards being evidenced by the fact that in one rural school local employment had been found in every case for the boys when they left school owing to their acquired knowledge of gardening, which employment they had [illegible]. Obviously, therefore, a solution of the much-discussed "back to the land" question was herein involved, though rather in the sense of preventing the exodus than subsequently inducing a return, a solution which [illegible] the more satisfactory, since, as human nature is constituted, the return to rural [illegible] and pursuits of a man who has become accustomed to city life, and thereby lost touch with Nature, is little to be hoped for. A hearty vote of thanks to Mr. Dean [illegible] the meeting.

Reading Rose Show.

The Reading Rose Show was held on Wednesday, June 30, in the charming grounds of Foxhill, kindly lent for the occasion by Rufus D. Isaacs, Esq., K.C., M.P., whose rose garden and grounds were open to inspection during the afternoon. Mrs. Rufus Isaacs is the president of the society, and the Rev. Page Roberts is chairman of committee, and both assisted in the judging. The show was a good one, and some remarkably fine flowers were staged. In the local classes the flowers showed signs of bad weather, as a heavy hailstorm visited the biscuit town the day before the show.

Some excellent non-competitive displays were made by Mrs. Phippen, floral designs; Mr. S. J. Vinden, floral designs; and Mr. F. Eames, Frome, hardy flowers.

NURSERYMEN.

Premier place for forty-eight blooms, distinct, in the nurserymen's section, was won by Messrs. A. Dickson and Sons, Newtownards, Co. Down, who had a really fine lot of flowers, their finest being Mdme. Jules Gravereaux, Killarney, Chas. J. Grahame, Mdme. P. Rivoire, Mrs. David McKee, George Dickson, The Bride, Mrs. Arthur Munt, and Bessie Brown; second prize fell to Mr. John Mattock, Headington, Oxford, who had smaller flowers.

The best twenty-four blooms were those contributed by Mr. Chas. Turner, Slough, and he had Maman Cochet, Lyon Rose, Hugh Dickson, Mrs. J. Grant, and Mrs. J. Laing in good form; Mr. Henry Drew, Longworth, came second; and Messrs. E. Bide and Son, Farnham, third. Mr. John Mattock led for a dozen teas or noisettes, with a bright set of Marechal Niel, Souv. de Pierre Notting, Medea, Cleopatra, etc.; Mr. H. Drew second, and Messrs. Bide and Son third.

The best dozen blooms of any H.P. rose came from Mr. John Mattock, who showed bright but rather small specimens of Captain Hayward; Mr. Chas. Turner second with Mrs. J. Laing; and Messrs. E. Bide and Son third with the latter variety. Messrs. A. Dickson and Sons scored for twelve blooms of a H.T. rose with Lady Ashtown, and Mr. J. Mattock followed, with Mr C. Turner third, each showing the same variety. For a dozen tea roses Mr. J. Mattock led with Souv. d'Un Ami in fairly good form. For twelve trebles, Messrs. A. Dickson and Sons scored, and they had Ulrich Brunner, Mrs. J. Laing, Tom Wood, J. Cuff, and Dean Hole in good form; Mr. Chas. Turner was second.

A very fine bank of eighteen bunches of decorative roses secured the premier award to Mr. J. Mattock, who had a grand lot of Mdme. Ravary, Clara Watson, Richmond, Mdme. A. Chatenay, Lady Battersea, Mdme. Pernet Ducher, Aglaia, etc.; Mr. Chas. Turner a good second.

AMATEURS.

In the open amateurs' class for two dozen roses, Mr. Conway Jones, Hucclecote, Gloucester, worthily won first prize with grand blooms of Captain Hayward, Marechal Niel, C. J. Grahame, Hugh Dickson, Ulrich Brunner, Gustave Piganeau, etc.; Rev. T. G. Henslow, Stanton Rectory, Chippenham, second, and Mr. Beckshall, gardener to L. McKenna, Esq., The Honeys, Twyford, third.

The Rev. R. Powley, Upton Scudamore, Warminster, led for eighteen flowers, and he had a huge bloom of White Maman Cochet. Mr. C. Page, gardener to J. B. Fortescue, Esq., Dropmore, Maidenhead, second; and Rev. F. Page Roberts, Strathfieldsaye, third. First prize for a dozen blooms was won by Mr. E. F. Brown, Slough; Mr. Bircher, gardener to G. R. Bonnor, Esq., Tillingbourne, [illegible], Gloucester, second; and Mr. Tugwood, gardener to Mrs. D. H. Evans, [illegible]'s Hill, Pangbourne, third.

The class for a dozen tea roses was a good one, the awards going in order to Rev. R. Powley, Mr. Conway Jones, and Rev. T. G. Henslow. For twelve blooms of one variety Mr. Conway Jones was easily first with a fine lot of Marechal Niel, Rev. R. Powley second with Maman Cochet, and Mr. Tugwood third with Caroline Testout. Mr. Conway Jones led for six trebles with a good box of Marechal Niel, Hugh Dickson, Lady Ashtown, Captain Hayward, Mrs. J. Laing, and C. J. Grahame.

Mr. Conway Jones had the best dozen bunches of decorative roses, and won in a good competition; Lady Sutton, Benham Valence, Newbury, second. The Rev. R. Powley, Mr. H. W. Dunlop, Maisonette, Earley, and Lady Sutton were also prize-winners in other classes for garden roses. The Rev. J. B. Shackle, Dropmore Vicarage, Maidenhead, had the best twelve blooms in another division, and Mr. W. Reed, Huxley, near Newnham, was second. In another section Miss Fisher, Court Hill, Potterne, Dorset, was first for twelve flowers..

In the section open to growers of fewer than 500 plants, the Rev. J. B. Shackle won the Challenge Cup and first prize for a dozen tea roses with good blooms of Mrs. E. Mawley, Bridesmaid, Mdme. Cusin, Souv. d'Un Ami, Maman Cochet, Innocente Pirola, etc.; Mr. J. T. Strange, Aldermaston, second, and Mr. C. Page third.

Premier award for a dozen tea roses, in a class open to growers within twenty miles of Reading, was won by the Rev. R. Powley, his Muriel Grahame, Bridesmaid, and White Maman Cochet being very good; Mr. F. Bircher second. Mr. W. Reed, and Mr. E. F. Brown, Lynton, Slough, were other successful competitors in this section, while in smaller classes we noted that Miss Mildred, Strathfieldsaye, won prizes.

LADIES' CLASSES.

In the decorative classes the awards for a table decoration of roses were made, in order of merit, to Mrs. Ashley, Ashdene, Reading; Mrs. Dunlop, Maisonette, Earley; and Miss Rose Strange, Aldermaston. Miss Page Roberts had the best basket of roses, and Mrs. Ashley was awarded second place. Miss Page Roberts secured a second prize for ladies' sprays, and Miss Rose Strange won the silver medal for three buttonholes, Miss Page Roberts coming a close second.

Richmond.

The thirty-fifth annual exhibition of the Richmond Horticultural Society was held on Wednesday, June 30, in the beautiful Old Deer Park, Richmond, and though the early morning was cool and threatening, the sun shone during the afternoon. There was a good show, but not nearly so fine as those held ten years or so ago. The competition was not keen, and the roses, as a display, fell far short of other years.

CUT FLOWERS.

Roses were not nearly so good as at Reading. Messrs. Frank Cant and Co., Colchester, were the only exhibitors of forty-eight trebles, and won the Gunnersbury Cup; their best varieties were Mdme. Melanie Soupert, Richmond, Mrs. J. Laing, Caroline Testout, Liberty, J. B. Clark, C. J. Grahame, Yvonne Vacherot, Bessie Brown, and Mildred Grant. Messrs. W. and J. Brown, Peterborough, had the best six bunches of garden roses, their Edna Meyer and Betty being specially good; Mr. W. Colin Romaine, Old Windsor, second. Messrs. W. and J. Brown were also first for twelve blooms in a special class, and here their C. J. Grahame and Richmond were charming; Mr. R. Browning, Sunbury, second. Mr. J. Palmer, Netherton Road, St. Margaret's; Mr. G. J. Favel, High Street, Hampton Hill; Mr. F. Thornton, gardener to A. Chancellor, Esq., Norfolk House, Richmond; Mr. W. J. Turner, King Edward's Grove, Teddington; Mr. E. Elliott, Tintern, Teddington Park; and Mr. W. Colin Romaine were prize-winners in other rose classes. Messrs. W. and J. Brown, Stamford, had the best box of twelve tea or noisette roses, one variety, showing Marechal Niel, and they led for twelve H.T.'s with Mildred Grant in fine form.

In the two leading classes for sweet peas Mr. T. H. Bolton, gardener to the Earl of Devon, Powderham Castle, Devon, was first, and he had James Grieve, Clara Curtis, Evelyn Hemus, Mrs. C. Foster, and Helen Lewis in good form. Mr. T. Conway, gardener to Earl Dysart, Ham House, Petersham, was second in each case.

Mr. Allum, gardener to L. Warde, Esq., Petersham House, Petersham, secured the chief award for twenty-four bunches of herbaceous flowers with a particularly fine collection, his Campanula Coronata, Lilium croceum, delphiniums, and Spanish iris being very fine; Mr. T. Conway, gardener to the Earl of Dysart, Ham House, Petersham, second with a good collection.

In the decorative classes Mrs. A. Robinson, Carshalton, led for a table decoration, with carnations, and Miss Cole was second. In another class Miss E. C. Hall, Bailey's Hotel, Gloucester Road, S.W., scored. Mr. Hayward, Kingston, had the best basket of roses, and Miss C. B. Cole, Feltham, the best basket of lilies and carnations.

GROUPS.

In the large group class Mr. H. Burfoot, Esq., Uplands, East Sheen, had the best group arranged for effect, his crotons, Clerodendron fallax, and schizanthuses being well arranged with ferns, palms, etc.; Mr. W. Vause, Leamington, second; and Mr. Redwood, gardener to Mrs. Fitzwygram, Larkfield, Hampton Hill, third.

In the large group class Mr. H. Burfoot, gardener to Lady Waechter, The Terrace House, Richmond, won first prize with a very pleasing arrangement of liliums, Humea elegans, crotons, amaryllis, etc., over a groundwork of maidenhair ferns and gypsophila; Mr. W. Vause, Leamington, second.

The best arranged basket of plants was the one staged by Mr. Allum, who had a phœnix surrounded by caladiums, clerodendrons, gloxinias, etc.; Mr. G. Watts second with a design containing numerous orchids; Mr. Burfoot third.

PLANTS.

Mr. T. Rabbitt, gardener to L. Edwardson, Esq., Bellari, Sidcup, had the best half-dozen tuberous begonias, his double salmon and yellow varieties being excellent. Mr. W. J. Hill, gardener to G. Aitkins, Esq., Marston, East Sheen, a good second. Mr. Edwardson's plants were of Mr. Gwillim's strain. Lady Waechter, Richmond, had the best nine gloxinias, while Mr. Hicks, gardener to C. M. Bartlett, Esq., Uplands, East Sheen, led for six plants for Messrs. Sutton and Sons' prizes, Mr. W. Chant, gardener to E. R. W. Bennett, Esq., Darby Lodge, Sunbury, coming second, and also showing well. Mr. Hill was first in Messrs. Sutton's class for begonias.

Mr. A. Howard, gardener to H. Little, Esq., Baronshalt, Twickenham, secured first place for six orchids with two varieties of Lælia purpurata, L.-c. G. S. Ball, L.-c. Canhamiana, L.-c. Martineti, and Cattleya Gaskelliana; Mr. Norman L. Smith, St. Margaret's Road, Twickenham, second. In another class Mr. Wm. Vause, Leamington, was first for six orchids; Mr. J. Hill led for streptocarpuses; and Mr. J. Quarterman, gardener to A. Burton, Esq., Moorestoot, East Sheen, second. Mr. J. R. Brierley, Erleigh, Richmond, showed the best hardy ferns.

The best six caladiums, well-grown specimens, were from Mr. H. Hicks, who was followed by Mr. H. Lawrence, gardener to Mrs. Vaughan Arbuckle, Stawell House, Richmond, with Mr. Allum third. Mr. Vause was an exhibitor of six palms, and he was awarded first prize for his big kentias and seaforthias; Lady Waechter second. Mr. Vause gained a second prize for six fine foliage plants with big but not very bright crotons, etc. Fuchsias were good, Mr. W. Redwood leading for six plants with graceful pyramids. Mr. Allum was successful for coleuses, leading with nicely coloured, flat-trained specimens; Mr. H. Hicks was an excellent second, and Mr. Quarterman third.

FRUIT AND VEGETABLES.

Mr. H. H. Brown, gardener to W. G. Raphael, Esq., Englefield Green, led for white grapes with Buckland Sweetwater; Mr. W. Lintott, gardener to Sir W. Greenwell, Bart., Marden Park, Caterham, second, with Foster's Seedling. Mr. Lintott led for black grapes with good Black Hamburgh, and Mr. H. H. Brown was second. Mr. G.

Thompson had the best peaches, Crimson Galande, and Mr. H. H. Brown the best nectarines, Early Rivers.

Mr. E. Conway led for a collection of six kinds of fruits with Black Hamburgh and Foster's Seedling grapes, Early Rivers nectarines, Peregrine peaches, Leader strawberries, and Emerald Gem melon. Mr. G. Thompson, gardener to the Messrs. W. and G. Wells, Hounslow, had the best two varieties of strawberries—Royal Sovereign and Leader.

Mr. Conway was a prominent prize winner in the vegetable classes, winning the majority of the first prizes. Mr. Bolton was also successful.

NON-COMPETITIVE.

A very large amount of space was given up to trade displays, consequently these were unusually large and excellent. Messrs. T. S. Ware, Feltham, sent hardy flowers and begonias; Messrs. J. Peed and Son, Norwood, hardy flowers; Messrs. J. Veitch and Sons, Chelsea, roses and liliums; Mr. L. Russell, shrubs and lilies; Mr. W. H. Page, Hampton, roses, lilies, and carnations; Messrs. W. and J. Brown, Stamford, roses; Mr. W. Thompson, Sheen, palms and lilies; Mr. H. Fordham, Twickenham, gloxinias; and Mr. Bruckhaus, Twickenham, Phœnix Roebelini, etc.

MARKETS.

COVENT GARDEN.

Flowers.

Splendid supplies of flowers are offered, and trade is steady.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

STRAWBERRIES. — A. B. H., Belcherton: We duly received the package, and shall have much pleasure in acceding to your wishes.

SPOTS ON ODONTOGLOSSUM LEAVES. —D. S., Sipson: The spots on the leaves are due to the action of strong sunlight. Odontoglossums love shade, and even in such a season as the present it is most desirable to shade them with lath blinds that run on a raised frame of light wood six inches or so above the glass. The occasional gleams of sunshine are very bright and quickly do harm to leaves that are not accustomed to them, and have not yet become hardened by a steady increase of bright light. The spots are in no sense due to fungus attack.

PELORIA IN SWEET PEAS. — J. W., Exeter: The only instance of peloria in sweet peas that has come under our notice is the one illustrated in the "Sweet Pea Annual" for 1909. It was a flower of the new Mrs. Andrew Ireland, with the waved petals spread around the central ovary and stamens, instead of forming keel, standard, and wings. The flower appeared in Messrs. Dobbie and Co.'s seed grounds at Marks Tey, and the flower was worn by Mr. Cuthbertson, the President of the National Sweet Pea Society, at the London Sweet Pea Show of last summer.

FUNGUS ON BIRCH TREE.—W. H. T., Tiverton: The fungus on the birch tree is Polyporus betulinus, and if you have other birch trees near by that you do not wish to be attacked, then remove the large fungus growth at once, and keep watch for and remove others as they appear, so that spores may not be distributed. A better plan would be to cut away and burn the fungus, and then cut down and burn the tree itself, for, though the horseshoe-shaped growth is an annual production, the mycelium of the fungus is perennial, remaining in the wood and producing the fruiting stage or pileus each season. The various polyporus are wound fungi, the spores entering a tree by means of an undressed cut, a broken branch, etc.

PRIMULA CAPITATA.—E. R. H., Maidenhead: The species is undoubtedly Primula capitata, and it usually flowers in autumn. The reason why your plants are flowering thus early is that they are strong examples from seed sown early last year, and wintered in pots in a frame. You do not say so, but we expect your plants are still in pots, and if this is so, earliness of flowering is the more easily explained.

CUTTING AWAY TOMATO LEAVES.—A. G. A., Sandwich: We do not advocate the removal of tomato leaves from fruiting plants, but there are times and occasions when the removal of a part, even half of each leaf may materially assist in the full development of the crop of fruits. Planting may have been rather close, and the soil rather rich, and, as a consequence, the leafage may greatly reduce the quantity of light among the plants. In such cases we should not hesitate to gradually reduce the leaf area by removing about half of each leaf—not all the leaves at once—and even a whole leaf here and there, where it prevents the light from reaching the fruits. Some tomatoes have much coarser growth than others, and you should therefore choose those with comparatively small leaves for your limited space.

PROPAGATION OF THE MAIDENHAIR TREE.—C. M. H., Wellington: This fine tree (Ginkgo biloba) may be readily propagated by sowing imported seeds in spring, placing them in a cold frame. Cuttings of half-ripe growths inserted in sandy soil in a cold frame towards the end of the summer will root readily, while, if there are branches near the ground, these may be layered in the usual way. There are several varieties of the ginkgo, and these must be propagated by grafting on to the type, under glass during the winter. The chief varieties are laciniata, with large, deeply-lobed leaves; fastigiata, with upright, poplar-like habit; pendula, with weeping branches; variegata, with variegated leaves; and aurea, with leaves that are of yellowish hue.

MAGGOTS IN CHRYSANTHEMUM LEAVES.—W. W. L., Farnborough: Spraying with soot water, or a quassia solution will render the leaves distasteful to the fly, and she will not deposit her eggs therein. At present you had better remove and burn all very badly-infested leaves, and kill the maggots in the remainder, by squeezing them between thumb and finger or picking them out with the point of a sharp knife. It is a troublesome job, but well worth while. No spraying is strong enough to reach and kill the maggot without killing the leaf as well.

SIBERIAN IRISES.—F. G. W., Fakenham: Your plant is the white variety of Iris sibirica, a beautiful and graceful plant that is not likely to do itself justice in the dry border close to the house. Iris sibirica and its varieties always succeed best and look best when grown in a moist situation, such as a lake margin or stream bank provides. It increases readily, and is in no sense difficult to propagate by division.

NAMES OF PLANTS.

W. W. L., Farnborough. — Streptosolen Jamesoni.

F. A., Chard.—A varietal form of Pernettya mucronata.

B. N., Temperley.—1, Begonia manicata; 2, a variety of B. Rex; 3, Pteris cretica albo-lineata.

S. E. G., Ripon.—1, Leycesteria formosa; 2, Cornus Mas; 3, Streptosolen Jamesoni; 4, Saintpaulia ionantha; 5, Pyrus Aria; 6, Adiantum fissum.

D. B. W., Wellingborough.—1, Oncidium crispum; 2, Lælia purpurata; 3, badly damaged, probably Thunia Marshalliana; 4, Cattleya Trianæ Warneri.

R. A., Bideford.—1, Ginkgo biloba; 2, Oncidium flexuosum; 3, Dictamnus Fraxinella; 4, Croton interruptum; 5, Cryptomeria elegans; 6, Libocedrus decurrens.

GARDENING APPOINTMENTS.

Mr. William Williams, for the past six years gardener to the late E. C. Burton, Esq., The Lodge, Daventry, has been appointed head gardener to D. C. Haldeman, Esq., The Rookery, Downe, Kent.

Mr. Alfred J. Hartless, for some time at Waterlow Park, Highgate, and who has been hon. secretary to the London Branch of the British Gardeners' Association, has been appointed assistant to Mr. F. G. Drew in the horticultural department at University College, Reading. Mr. Hartless will have special charge of the new fruit-growing station.

Stour Valley Horticultural Society.
Newmarket Horticultural Society.
SATURDAY, July 10.—Edgware Rose and Sweet Pea Society.
National Amateur Gardeners' Association Exhibition, Royal Botanic Gardens, Regent's Park.
Purley Horticultural Society.

CATALOGUE RECEIVED.

HEATH AND SON, ALPINE BOTANIC GARDENS, CHELTENHAM.—Hardy Plants for Rock Gardens and Herbaceous Borders. A full and exceptionally well-prepared catalogue of hardy perennials that may well be described as a valuable text book on the nomenclature and the cultivation of these subjects. Upwards of 3,000 species and their varieties are enumerated and described, and the descriptions are accompanied by concise notes that will be of considerable assistance in the making of selections for particular purposes. The nomenclature followed is that of the "Index Kewensis," and synonyms are given of those plants which have become more or less generally known under wrong names, or which for scientific reasons have had their names altered by the Kew authorities. Altogether a noteworthy publication, which is rendered additionally attractive by several excellent illustrations.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WEED KILLER used once a year "No weeds can live." RICHARDS' ARSENATE OF LEAD for all leaf-eating insects. CUCASA (fungicide), the finest preparation of copper ever offered to gardeners. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

JOURNEYMAN (Inside); good experience in Plant and Fruit Houses; age 25; abstainer. A. P. DAVIS, Bella Vista, Belmont Road, Maidenhead.

LANDSCAPE GARDENING. Mr. C. F. JACKSON, now disengaged, begs to offer his services for landscape improvement works; long experience; references. Address, 110, Cannon Street, London, E.C.

YOUNG MAN as GARDENER (Under, Outside or Inside and Out); 5½ years' experience; age 21; disengaged when suited; North preferred. F. STRUDWICK, Newgate Street, near Hertford, Herts.

YOUNG MAN, age 21, seeks SITUATION Inside or Inside and Out; in Gentleman's Garden; good character. Apply HENTALL, 1, Gordon Road, Highcliffe, Hants.

YOUNG MAN, Inside and Out, strong, honest, and good worker; 3½ years in present situation; age 19. WATTS, Gardener, The Knoll, Ascot, Berks.

YOUTH (16) seeks SITUATION on a large Mixed Farm; services for board and lodgings; good home. ARMSTRONG, East Barnet, Herts.

STRONG, active YOUNG MAN, age 21, seeks SITUATION as Kitchen and Pleasure Ground Man; 4½ years' good, practical experience, and good references; leaving through death, single. Address, G. BUNCE, c/o Mrs. Corder, 26, Southwood Lane, Highgate, N.

A YOUNG MAN, 20 years of age, seeks SITUATION in gardens, outdoor, on lawns or pleasure gardens; experience in private gardens for 2 years. Address, REDDING, Tysoe, Kineton, Warwick.

YOUNG MAN, age 21, good knowledge Inside and Out; five years' experience; good character and well recommended. A. HILL, Bardney Road, Wragley, Lincs.

YOUNG MAN seeks SITUATION; seven years' experience in Nursery work; three experience in Private Garden; good references. Apply C. H., 3, Elm Cottages, Horsemore Green, Langley, Bucks.

YOUNG MAN, age 20, in Garden or Nursery; has good knowledge of Seeds and Bulbs; can be well recommended. Write to S. N., 6, Kassala Road, Battersea, S.W.

CARPENTER and JOINER, single, seeks SITUATION on Estate, or as House Carpenter, abstainer; excellent references, own tools. FEARN, Moseley Terrace, Rolleston, Burton-on-Trent.

HANDYMAN seeks SITUATION on Gentleman's Estate; good carpenter and joiner; own tools; can also do painting, paper-hanging, etc.; 11 years' good character. WILLIAM BARRIER, 17, Lennard Road, Penge.

MR. E. ANDREWS, "Bell House Gardens," Dulwich, S.E., wishes to recommend C. CURD, age 22, to any Lady or Gentleman requiring a YOUNG MAN (Inside and Out), well up Outside, eight years' experience; good references, abstainer. No circulars.

IMPROVER (Inside and Out), age 19; two years' experience at Compton Place Gardens, Eastbourne; Bothy preferred. C. MARSH, Grenden, Upperton Road, Eastbourne.

WANTED, SITUATION as an IMPROVER, age 17½; strong and willing; has been in present situation 4 years; total abstainer. Bothy preferred. A. HYLAND, Woodlands, Ticehurst, Sussex.

WANTED SITUATION as GARDEN LABOURER, age 29, married, no family; good knowledge of outside work (kitchen garden and pleasure ground); good scythe and spade hand; good reference. W. LING, Epperstone Road, Lowdham, Notts.

YOUNG MAN, age 23, seeks SITUATION on Lawns or Pleasure Ground; willing to make himself generally useful; well recommended. Apply J. JORDAN, 13, Burlington Road, Enfield.

LADY wishes to recommend GARDEN BOY, age 14; tall; Gardener's Son. Apply the Hon. A. EDEN, Wangford, Suffolk.

SITUATION COUPON

To the Advertisement Manager of "THE GARDENERS' MAGAZINE,"
148 & 149, Aldersgate Street, London, E.C.

For JULY 17, 1909.

Please Repeat my Advertisement.

NOTES OF THE WEEK.

An Interesting Jubilee.

The celebration of the jubilee of two of the standing committees of the Royal Horticultural Society during the past week has been an interesting episode in the history of the society, and may well be regarded as an event of considerable importance in its relation to horticulture generally. The dinner given on Wednesday evening to the members of these committees was a pleasant function and of interest as a proof of the appreciation by the Council of the great value of the work that has been accomplished, and is being done, by these and other of the standing committees of the society. The comparatively large number of guests was interesting also as evidence of the public spirit that obtains among horticulturists and the readiness with which they give their services at considerable cost in time and money when they have an opportunity for assisting in the progress of the art with which they are intimately associated. The Fruit Committee, the eldest of the several standing committees, was formed in the spring of 1858, and consequently attained its jubilee last year; and the Floral Committee was founded in June, 1859, and therefore completed its fiftieth year of activity last month. To some of those who are not fully conversant with the history of horticulture during the past hundred years, it may appear surprising the Royal Horticultural Society should have been established more than half a century before taking advantage of the help a judiciously-formed standing committee can so well give in dealing with new introductions. But it should be remembered that in the first half of the nineteenth century governing bodies of great horticultural societies held views with regard to their responsibilities, and to methods of procedure, that differed materially from those that obtain at the present time. Although the need of a standing committee was not recognised at an earlier period by the Council of the Royal Horticultural Society, there were not wanting some time previous those who recognised the necessity of a central body to whom novelties could be submitted. We have evidence of this in the existence at that time of the Pomological Society, which had been founded for the purpose of assisting fruit growers, more particularly, in determining the merits of new and little known fruits. Another proof was afforded by the London Floricultural Society, which had for one of its objects the granting of awards to meritorious florists' and other flowers. Both of these societies were under the management of active workers, fully conversant with the requirements of those engaged in the cultivation of the classes of subjects with which they were associated, and excellent work was done. But neither of them became sufficiently strong to occupy a commanding position. Whether in making the new departure, the Royal Horticultural Society was stimulated by the activity of the two small bodies, or influenced by suggestions that emanated from them, is not quite clear, but it is evident the members of the societies were ready to serve on the new committees. The first chairman of the Fruit Committee was Mr. Charles Edmonds, gardener at Devonshire House, Chiswick, then one of the leading gardening establishments in the western suburbs of London, and his fine presence and practical knowledge admirably fitted him for so important a position. Since the late Mr. Edmonds' time many eminent pomologists have presided over the meetings of the Fruit Committee. Of the present chairman there is no occasion to speak, for Mr. George Bunyard, V.M.H., is well known as one of the leading pomologists of the day, and held in the highest respect. He is highly esteemed by the members, who testified to their appreciation of his kindness and courtesy by presenting him on Wednesday evening with his portrait. The first chairman of the Floral Committee was the Rev. Joshua Dix, a fine old florist, who had no halting opinion as to the soundness of his views on all that related to florists' flowers. He occupied the position for some years, and rendered good service both to the society and the cause of floriculture. We remember with a sense of gratitude the excellent work accomplished by other chairmen of this committee; and, while anxious to avoid instituting comparisons, it must be said that no one achieved a greater degree of success than has Mr. William Marshall, V.M.H., who happily still occupies

MR. WILLIAM MARSHALL, V.M.H.
Chairman of the R.H.S. Floral Committee.

that position. In briefly referring to the splendid services these committees have rendered during the past fifty years, we must not be understood as suggesting that they have not made mistakes. But they have been so few as to be really not deserving of notice. Each in its turn has been subjected to some amount of criticism, but this has so decreased of late years that now the decisions are seldom questioned. If there is any grumbling, it is usually from residents in distant parts of the kingdom who have but few opportunities for seeing the newer introductions until they have been generally distributed. They are successful in obtaining, as the result of cross-fertilisation, selection, or, it may be, by accident, forms that are superior to the older kinds, but they may be not equal to the best of the recent introductions. Knowing but little of the latter they submit their novelties to one of the committees, and when these fail to obtain recognition they are keenly disappointed. The standing committee is, in the conduct of its work, kept fully acquainted with all the more important of the newer introductions, and is therefore in a much better position to form an estimate of the merits of anything that may be submitted to it than those whose area of observation is somewhat limited. Herein lies the strength of standing committees such as those which have just celebrated their jubilee. In making awards it is not sufficient to know whether the novelties are in themselves good, bad, or indifferent, but it is essential it should be known whether they are superior or otherwise to the best of the introductions in the same way. This fact is now generally recognised, and the two committees may enter on their second half century without any apprehension as to the estimation in which their work will be held by all who are interested in horticultural pursuits.

Mr. William Marshall, V.M.H., has for a long number of years been so actively engaged in promoting the various movements that have for their object the advancement of horticulture or the support of those associated with gardening who are in need of help, that we have had occasion to give one or two portraits of him in the Gardeners' Magazine. But until now we have not had the pleasure of including his portrait among those of the distinguished horticulturists which are given week by week on the front page. The celebration of the jubilee of the Royal Horticultural Society's Floral Committee affords us a fitting opportunity for having this pleasure, which will be heartily participated in by his many horticultural friends. In our reference to Mr. Marshall when he had the distinction of the Victoria Medal of Honour conferred upon him, which appeared in the Gardeners' Magazine for March 17, 1906, we gave a short account of his many-sided activities, and we need not now refer to them. For upwards of forty years, Mr. Marshall has devoted a large part of his leisure to horticultural matters, and obtained high distinction for orchids and other subjects. He was one of the founders, more than forty years ago, of the United Horticultural Provident and Benefit Society, and for a considerable period he was chairman of the committee of the Royal Gardeners' Orphan Fund. He has long occupied a seat on the Council of the Royal Horticultural Society, and for upwards of twenty years he has been chairman of the society's Floral Committee. In 1906 the members of this committee and other friends had Mr. Marshall's portrait painted in oils, and presented it to the Royal Horticultural Society, and entertained him at a public dinner.

Jubilee of the R.H.S. Floral Committee.—On the opposite page we have the pleasure of giving the portraits of the members of the Floral Committee from a photograph taken by Mr. A. J. Campbell at Holland Park on Tuesday last. The members included in the group are as follows: Front row, from left to right, Messrs. W. Cuthbertson, George Gordon, V.M.H., Rev. F. Page-Roberts, George Paul, V.M.H., H. B. May, William Marshall, V.M.H., C. E. Shea, J. T. Bennett-Poë, V.M.H., J. Douglas, V.M.H., C. T. Druery, V.M.H., and Walter T. Ware; second row, Messrs. E. T. Cook, E. H. Jenkins, W. Baker, C. Blick, W. James, G. Reuthe, J. Bain, E. Mawley, V.M.H., R. Wallace, C. Fielder, C. E. Pearson, R. C. Notcutt, J. Green, J. Walker, W. Bean, R. C. Nevill, A. Kingsmill, E. A. Bowles, and J. Dixon. Back row, Messrs. A. Turner, H. J. Cutbush, J. F. McLeod, W. Jennings, N. F. Barnes, H. J. Jones, W. Howe, T. W. Turner, W. P. Thomson, and R. Hooper Pearson.

Honours to Botanists.—The delegates to the Darwin Centenary Celebration, recently held at Cambridge, upon whom the degree of Doctor of Science, honoris causa, was conferred, included Robert Chodat, professor of botany at Geneva; Frank Darwin, F.R.S., honorary fellow of Christ's College, and formerly reader in botany; Karl F. Goebel, professor of botany at Munich; Hermann Graf zu Solms-Laubach, professor of botany at Strassburg; Clement Timiriazeff, professor of botany in Moscow; Hermann Vöchting, professor of botany at Tübingen; Hugo de Vries, professor of botany at Amsterdam; and Charles René Zeiller, professor of palæobotany in the Ecole des Mines, Paris.

Dr. Shackleton, who is a vice-president of the National Rose Society, and takes an active part in its management, had the honour of being presented to the Queen on the occasion of the society's exhibition held on the 2nd inst. The President, the Rev. F. Page-Roberts, having presented Dr. Shackleton, Her Majesty very heartily congratulated him on the splendid achievements of his son, Lieutenant Shackleton, in his expedition to the South Pole.

Horticultural Exhibition at Le Touquet-Paris-Plage. — The programme of the International horticultural exhibition that is being held at Le Touquet-Paris-Plage during the current summer includes a special flower show, extending from August 21 to 29. To this exhibition all classes of ornamental plants, cut flowers, fruits, and vegetables are invited, and we are assured that exhibitors from England will be heartily welcomed. Le Touquet-Paris-Plage is one of the most popular of the French watering places and is much frequented by English visitors. M. H. Martinet, editor of "Le Jardin" is the commissioner of the exhibition, and schedules may be obtained on application to the Commissaire de L'Exposition Internationale d'Horticulture à Paris-Plage, France.

Flowers at Wisley.—The Royal Horticultural Society's gardens at Wisley provide many beautiful pictures at the present time, and one of the finest is the little lake in the wild garden, where, surrounded by spiræas, bold gunneras, and graceful bamboos, the water lilies are very charming, while the display of Iris Kæmpferi is very fine. These latter irises are also fine in the water in another part of the garden. Pæonies have done well, and the large collection is very gay. The roses form another attraction, especially those on pillars, the big single Una being particularly pretty. Under glass cannas and pelargoniums provide a floral feast. Hardy herbaceous and alpine plants and flowering shrubs are other interesting features. Apart from flowers, there are good crops of peaches, nectarines, melons, and grapes under glass, and the extensive lettuce trials afford an unique opportunity for comparing the merits of both cos and cabbage varieties.

Midland Carnation and Picotee Society.—We are informed by Mr. T. Humphreys, the hon. secretary, that owing to the exceptionally late season the annual exhibition of carnations, arranged to take place on July 28 and 29, has been postponed until Thursday and Friday, August 5 and 6.

Horticultural College, Swanley.—The presentation of prizes to the students will take place at the college on Thursday, the 15th inst., at 4 p.m. Viscountess Falmouth will present the prizes and Sir John Cockburn will occupy the chair. In addition to the College, South Bank, the Colonial Branch (North Bank), and gardens will be open for inspection.

Inaugural Supper at Bush Hill Park.—There was a large attendance at the inaugural supper given by Mr. Stuart Low to his staff (Messrs. Stuart Low and Co.) and friends, on Wednesday evening of last week. Mr. Low presided, and among the old Claptonians present were Mr. W. Watson, of Kew, who served under the Lows at Clapton thirty years ago; Mr. Harry Barnard, who was 48 years with Messrs. Hugh Low and Co.; and Mr. George Mayes, who has served three generations of the Low family, and been with them fifty years. Mr. Stuart Low presented Mr. Mayes with a handsome walking stick, and his many friends contributed a purse of gold. Mr. Stuart Low received a handsome loving-cup from his employees in memory of the inauguration of the firm of Stuart Low and Co. A very pleasant evening was spent, and an excellent programme of music, under the direction of Mr. Montague Ailwood, contributed greatly to the pleasure of those present.

Rhododendrons at Harewood Lodge. — The gardens of Harewood Lodge, Broadbottom, Manchester, the residence of Colonel Sidebottom, are especially rich in choice rhododendrons, and the groups of these have for some time been immensely attractive. Not only is the selection of varieties at Harewood Lodge an exceptionally good one, but the plants are skilfully cultivated by Mr. W. Mas[illegible], who has long had charge of the gardens at Harewood Lodge.

Apple and Plum Crops round Evesham will, a correspondent reports, be light this season. Owing to the heavy crop borne last year plums did not bloom so freely as usual last spring, and the fruit set indifferently. Apples gave promise of a good crop, but, owing to unfavourable climatic conditions this promise will not be fulfilled.

Horticulture in Holland.—A comprehensive exhibition of horticultural products will be held by the Dutch Horticultural Society at Zeist, near Utrecht, from August 25 to September 1[illegible]. The special exhibitions in connection therewith will be stove and greenhouse plants and orchids, August 25 to 28, cut roses, September 1 to 3, "Flowered work," September 10 to [illegible] 7 to 9, cut flowers, September 14 to [illegible] Vegetables and fruit, September

GREAT FLOWER SHOW AT HOLLAND PARK.

On July 6 and 7, in the Holland House Park, Kensington, the Royal Horticultural Society's summer show was held, and it was the finest of the series, being in some respects better than the great Temple Show of May last. Orchids, roses, and hardy flowers were the great features of this grand display, and there were six tents devoted to plants, flowers, and sundries. It was very unfortunate that the weather set in so wet just about half-past one o'clock on the opening day, as the crowds of visitors could not well wander outside the tents or in the famous Holland House gardens, and they remained under canvas until there was a solid mass of humanity, seeing little of the show themselves and rendering note taking almost an impossibility.

THE ROYAL HORTICULTURAL SOCIETY'S FLORAL COMMITTEE.
(See page 526 for names of members.)

FLORAL COMMITTEE.

Mr. A. F. Dutton, Iver, Bucks, contributed a good set of carnation blooms, his Mikado, President, Hesperia, Robert Craig, and Windsor being especially fine. Messrs. J. K. King and Sons, displayed sweet peas in large numbers, and set up all the newer kinds. An exhibit of cut roses, chiefly teas, and a fine lot of carnations were arranged by Messrs. R. H. Bath, Lim., Wisbech, the same firm exhibiting pæonies and delphiniums in great style. An attractive group of hardy flowers, artistically disposed, came from Messrs. Artindale and Son, Nether Green, Sheffield. It was a combination of rock garden, herbaceous border, and water garden, and the little bridge over the lily pool was a pretty feature. Verbascum pannosum, Calceolaria Golden Gem, Cypripedium spectabile, pink spiræas, and campanulas were notably good.

English irises were largely and well shown by Messrs. William Bull and Sons, King's Road, Chelsea, who had an excellent collection of varieties. Gladioli of the Colvillei section were well shown by Mr. Frank Lilley, Guernsey, the varieties King Edward, scarlet; Lord Byron, pink; Princess Victoria, salmon; Queen Alexandra, deep pink and cream; and King of Spain, light scarlet, being especially fine. Messrs. Reamsbottom and Co., Geashill, King's Co., Ireland, put up a collection of hardy flowers, lilies and delphiniums predominating. Messrs. J. Cheal and Son's rock garden was attractive, the sedums, campanulas, dwarf roses, and heucheras making a pleasing display. Mr. H. C. Pulham, Elsenham, set up a small rock garden whereon the dwarf companulas, dianthuses, and phloxes seemed quite at home. Messrs. E. Webb and Sons, Wordsley, Stourbridge, had an exquisite exhibit of sweet peas put up lightly in vases arranged on a light brasswork temple. The flowers were fine, and all the good varieties were represented. Under the temple were bunches of fine flowers, and around the base of the temple were excellent specimens of melons, tomatoes, peas, cauliflowers, carrots, etc.

A big bank of hardy flowers from Mr. R. C. Notcutt, Woodbridge, included good tritomas, pæonies, delphiniums, Spiræa arguta, and Kalmia latifolia; Mr. Notcutt also sent a display of roses. Messrs. G. Mallett and Co., Cheddar, set up a good lot of liliums, gladioli, campanulas, potentillas, Gerbera Jamesoni, and pæonies. Mr. G. Reuthe, Keston, Kent, showed hardy plants freely, but his arrangement was rather too solid; he had fine heucheras and pæonies, beautiful ixias, and a large number of dwarf campanulas, hardy orchids, heaths, and irises. Messrs. James Carter and Co., Holborn, were represented by a bold exhibit that was really made up of three groups. The central one of well-grown gloxinias, the left-hand one of sweet peas, and the right-hand one of splendid begonias, all doubles, and bright streptocarpuses. Mr. Howard H. Crane, Highgate, N., sent a pretty display of dainty violas, arranging the flowers in low bowls with a few sprays of foliage.

A very bright exhibit of hardy flowers was the one set up by Messrs. G. and A. Clark, The Nurseries, Dover; the delphiniums were very fine, and so were the gaillardias, irises, campanulas, heucheras, etc. Campanula Moerheimi, Gilia coronopifolia, Ostrowskia magnifica, and Geum coccineum Mrs. J. Bradshaw, were notably good. The same firm made a display of sweet peas.

The beautiful lavender-blue Solanum Wendlandi was again finely shown by Mr. W. J. Godfrey, Exmouth, who flowers it well in 48-sized pots; he also showed a bright red-leaved amaranthus, and a splendid strain of cup-and-saucer Canterbury bells, the flowers of large size and very regular in form. Messrs. H. and W. Evans, Llanishen, put up a small group of hardy flowers, and Mr. T. Cross, Bury St. Edmunds, showed sweet peas well. Messrs. Carter Page and Co., London Wall, were large exhibitors of sweet peas, and Mr. H. N. Ellison, West Bromwich, contributed a pleasing bank of ferns, including the newer nephrolepises.

A very fine lot of sweet peas, staged by Miss Hemus, Holdfast Hall, Upton-on-Severn, contained grand bunches of Paradise Carmine, Olive Ruffell, Paradise Beauty, Constance Oliver, Mrs. Chas. Foster, Evelyn Hemus, Zarina, and Chas. Hemus. Messrs. G. Gibson and Co., Leeming Bar, Bedale, displayed a grand lot of Oriental poppies and pæonies. Messrs. B. Ladhams and Sons, Shirley, Southampton, made a brilliant display with their gorgeous gaillardias, and their very useful varieties of pinks, such as Ethel, The King, Elsie, Miss Vince, Ernest Ladhams, Monarch, and Rosy Gem. Beautiful roses were shown largely by Messrs. Frank Cant and Co., Colchester, who, in a lovely set, included the Lyon Rose, Irish

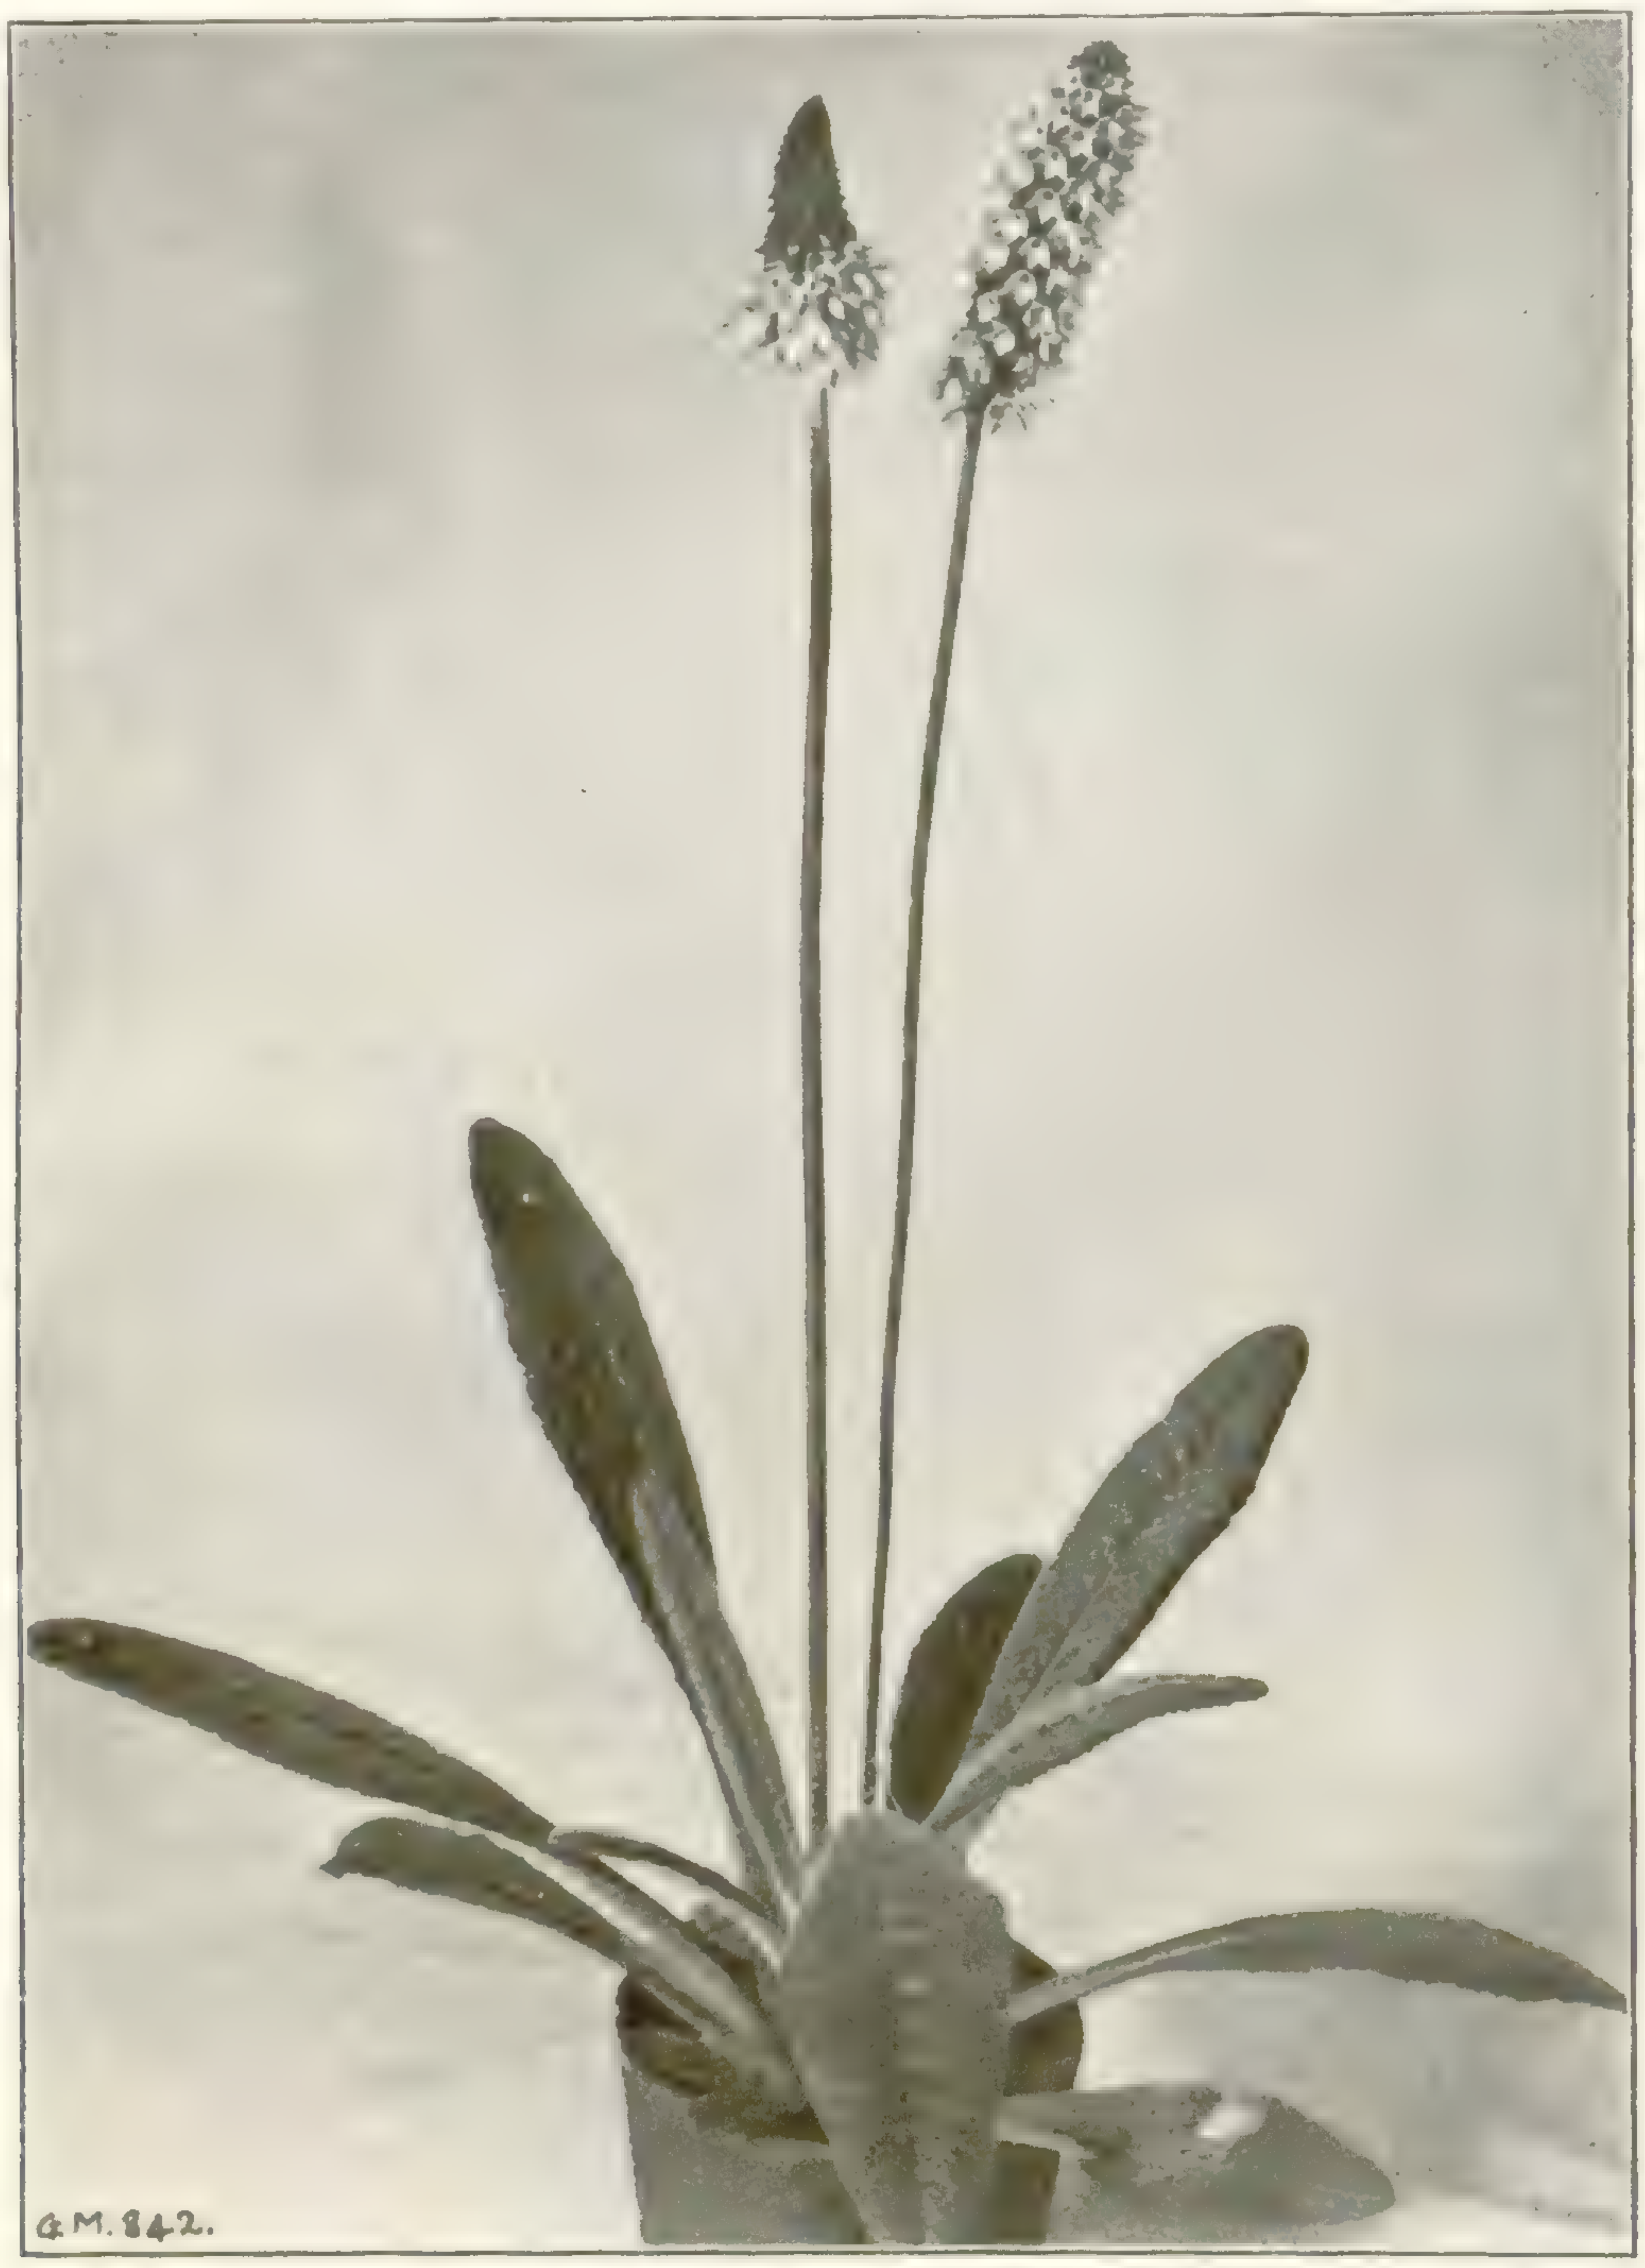
Glory, Richmond, Lady Ashtown, Liberty, and Mdme. Melanie Soupert. Mr. H. Hemsley, Crawley, contributed a rock garden display, and set up a small collection of hardy ferns. Messrs. B. Cant and Sons, Colchester, brought up a grand lot of rose blooms, their specimens of Mdme. Ravary, Mrs. W. J. Grant, Joseph Hill, Mdme. G. Luizet, The Lyon Rose, Captain Hayward, Countess of Gosford, Liberty, and Killarney being especially fine. Mr. A. J. Harwood, Colchester, exhibited hardy flowers, as also did the Guildford Hardy Plant Company.

Messrs. R. Harkness and Co., Hitchin, showed cut roses and a set of Canterbury bells. The delphiniums from Messrs. Kelway and Son, Langport, made a brave show, as set up in a big group; Zinfaudel is a fine deep purple blue. Pæonies, single and double were similarly arranged, and among the former Queen Alexandra, Meteor Flight, Her Grace, and White Lady were notably good. Sweet peas formed another group from Langport, but these were too stiffly arranged. Perpetual carnations were grandly shown by Mr. G. Lange, Hampton, who set up large bunches of fine blooms of Aristocrat, Lady Bountiful, White Perfection, Enchantress, Mrs. T. W. Lawson, Red Chief, Mrs. H. Burnett, and Britannia.

A fine bold arrangement of hardy flowers was displayed by Messrs. W. Cutbush and Son, Highgate, N., who set up big masses of pæonies, eremuri, English irises, liliums, Saracennia purpurea, delphiniums, spiræas, Crinum capense, campanulas, etc., and little pools of water lilies. Violas were very largely shown by Messrs. W. Artindale and Sons, Sheffield; their bowls of blooms were good, but the flowers on high arches were distinctly out of place.

Magnificent bold groups of noble delphiniums were put up by Mr. Amos Perry, Enfield, and between these were arranged pinks, gaillardias, and campanulas. Beyond this were irises and liliums, and then a little stream running amid reeds and phormiums, and under hardy fern fronds was itself the home of beautiful water lilies. A fine selection of choice hardy ferns were accommodated on a bold rock garden, and in the centre was a little dell and pool surrounded by Adiantum pedatum. Then came a broader pool furnished with water lilies and Japanese irises, and bordered with grass, and then one found the little stream again with more water lilies, irises, funkias, etc., and finally two more glorious banks of delphiniums, pæonies, eremuri, irises, and campanulas, and so one side of the central part of a whole tent was filled with beauty by Mr. Perry.

The American Carnation Company, Sawbridgeworth, had good perpetual and Malmaison carnations. Messrs. Barr and Sons, Covent Garden, brought up a collection of dwarfed Japanese trees, and these, as ever, attracted a great deal of attention; this firm also showed a very large collection of hardy flowers, in which pæonies, Spiræa aruncus, ixias, English, Spanish, and Japanese irises, antirrhinums, and gladioli were outstanding features. Fuchsias and cannas were the feature of Messrs. H. Cannell and Son's exhibit, and the graceful Fuchsia triphylla hybrids were especially graceful, while the gorgeousness of cannas attracted everyone, as also did the excellent cultivation of these fine plants.



PRIMULA LITTONIANA.

A new and distinct Chinese species, exhibited by Messrs. Bees, Lim., at the Holland Park Show, July 6 and 7, when it received a First-class Certificate. The flowers are rose-lilac, and the calyces deep red.

Sweet peas from Messrs. G. Stark and Son, Great Ryburgh, were excellent, and notable new things were Mrs. R. W. Pitt, Rhoda Smith, Olive Ruffell, George Stark, and The Premier.

Messrs. Paul and Son, Cheshunt, brought up a fine lot of herbaceous pæonies and delphiniums. Mr. W. R. Chaplin, Waltham Cross, was a large exhibitor of excellent rose blooms, and sweet peas, and Messrs. Pa and Son, Cheshunt, put up a large group of roses on the ground level, again showing their charming single variety Ariel. Mr. Robert Sydenham, Tenby Street, Birmingham, had Syeira Lee, America Spencer, Zephyr, Evelyn Hemus, Helen Spencer, and Sea Shell among his good set of sweet peas. Messrs. Gunn and Sons, Olton, once again showed phloxes in grand style, and also a fine lot of violas. The display from Messrs. Storrie and Storrie, Glencarse, Perth, included fine hydrangeas and good strains of streptocarpus and Primula obconica. Messrs. J. Peed and Son's circular group of caladiums was greatly admired, and Mr. W. L ton's lily of the valley were excellent. M. Maurice Prichard, Christchurch put up a very bright exhibit of hardy flowers, the delphiniums being very effective. Mr. Prichard had also a rock and water garden, with Japanese irises, spiræas, bamboos, water lilies, and other beautiful plants.

The most distinct and striking display in the show was the very fine one arranged by Messrs. R. Wallace and Co., Colchester. This firm had a long cupressus hedge against the tent, and against this put a long border of hardy flowers, filled with pæonies, groups of eremuri, Ostrowskia magnifica, campanulas, irises, kniphofias, liliums in variety, delphiniums, and many other beautiful subjects. A raised stone pathway ran along in front of the border, and on its lower side the retaining wall was filled with dianthuses, thyme, tiny campanulas, and other small plants suitable for walls and rockery. In front of the wall a collection of choice hardy ferns was planted, with little colonies of hardy primulas. The stone path ended in a low flight of steps leading down to a formal water garden, consisting of three pools, each filled with water lilies and with phormiums and eulalias set in artistic pots at the corners. The whole design was pleasingly distinct, and well carried out. Roses were largely shown by Messrs. Stuart Low and Co., Enfield, who also contributed a big bold display of perpetual and Malmaison carnations, very finely arranged in stands, vases, and baskets. The firm also showed large black fruits of the Lowberry. Messrs. Hobbies, Lim., Dereham, set up an extensive exhibit of roses, and they used weeping standards of Dorothy Perkins to great advantage over dwarfs and over a great array of cut blooms. Messrs. Wm. Bull and Sons, Chelsea, brought forward a bold collection of dracænas, palms, caladiums, crotons, ferns, and other choice foliage plants. L. R. Russell, Richmond, had a very pre arranged group of caladiums, choice dracænas, aralias, crotons, anthuriums, nepenthes, the quaint N. bicacarata being shown. The brilliant berried Nertera depressa was displayed in this group.

The sweet peas from Mr. W. J. Unwin were very finely grown, and included lovely bunches of The Queen, Prince Olaf, King of Spain, Mrs. W. J. Unwin, Constance Oliver, the brilliant Edna Unwin, Evelyn Hemus, etc. Mr. Paskett, gardener to E. J. J stone, Esq., Burrswood, Groombridge, brought up a beautiful lot of perpetual carnations and grand bunches of Evelyn Hemus, Princess Victoria, George Herbert, Elsie H Dyke, Helen Lewis, Helen Pierce, Mr. C bert, and Audrey Crier sweet peas. Blick, Warren Nursery, Hayes, showed a fine lot of border and show carnations, thoroughly maintaining his reputation for these flowers. Violas and pansies were largely and well shown by Messrs. Seagrave and Co., Gleadless. Roses and sweet peas—an excellent combination—were arranged by Messrs. E. Bide and Son, Farnham.

GYPSOPHILAS FOR CUT FLOWERS.

Few plants are more generally useful to the floral decorator than the various species of gypsophila, variously known as "chalk plants," from their partiality for a soil active in limestone; they are also known as "gauze" flowers, from the airy disposition which characterises the blossoms and branches. The latter attribute lends them distinction in all decorative work, as it scarcely matters whether the floral scheme is in miniature or on gigantic proportions; in either case the flowers of gypsophila can be used to advantage.

Gypsophila paniculata is one of the oldest, and still the best known species, and it forms cloud-like bushes a yard high and often double that in width, planted upon strong chalky soil it grows to enormous proportions, sending the thong-like roots deep into the rock. Gypsophila acutifolia grows to an equal height as the former, but produces rosy-lilac flowers a good deal larger; it generally flowers before paniculata, and always sees that species out.

Gypsophila paniculata fl-pl. is by far the best perennial form at present, similar in habit to the type; the miniature flowers are perfectly double, consequently they are lasting in character; the flowering season exceeds that of the type, and lasts until cut down with frost.

Gypsophila Steveni attains a height of 18 inches, and produces white flowers, which are at their best when G. paniculata is quite over; the habit is less erect than in that species, and generally requires the assistance of some support.

Gypsophila repens monstrosa is valuable in the rock garden; the flower sprays resemble paniculata in miniature, and are of suitable size for small vases.

Gypsophila elegans is an annual species, and valuable on account of its early flowering; to secure this seed is sown in autumn, and wintered in frames, planting out in borders in spring. The plant grows to a height of 2 feet, and in effect is similar to paniculata. The best form is that named grandiflora, having white flowers.

Walmsgate Gardens. **Thomas Smith.**

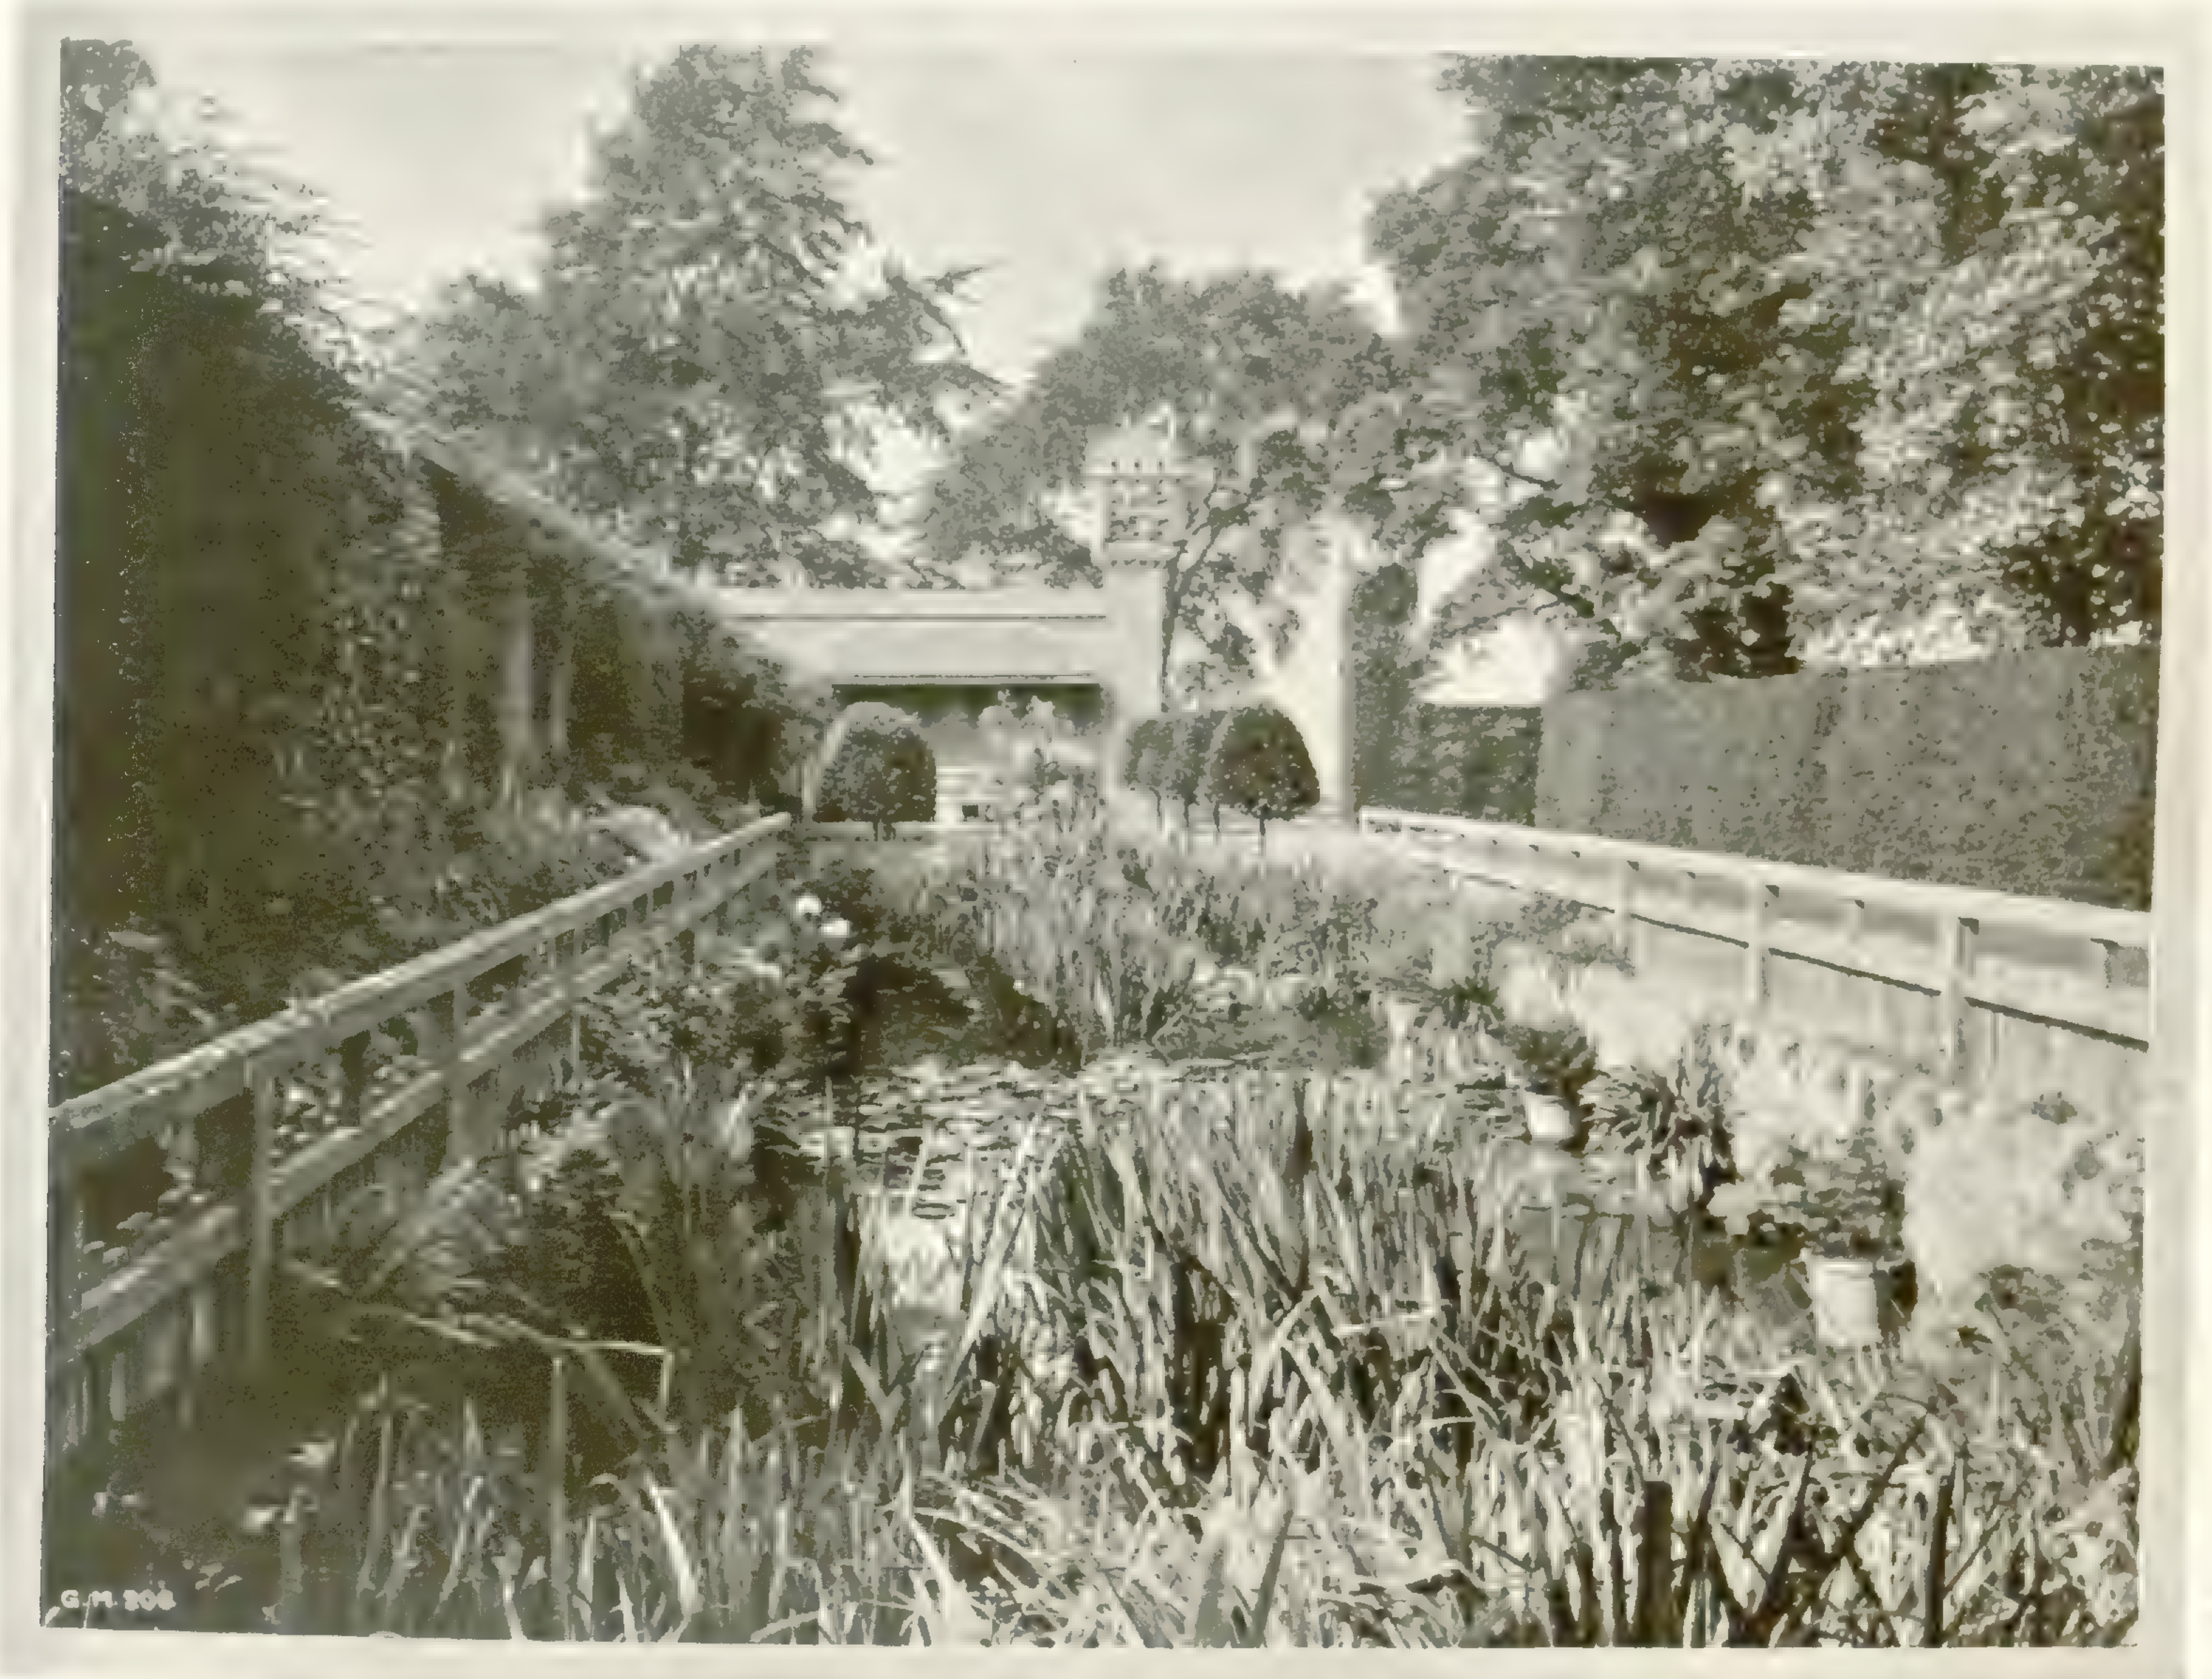
WATER GARDEN AT BARROW COURT.

Many of the very interesting features of Barrow Court, near Bristol, the residence of H. M. Gibbs, Esq., were illustrated in the **Gardeners' Magazine** of May 16, 1908, and we now present our readers with another view, representing a water garden made on the site of a manure yard. This is one of the many improvements made in these fine gardens. There is a long, buttressed, creeper-clad wall along one side, and a broad path and yew hedge on the other, with a garden shelter and a dovecote at the end, where the extension of the terrace finishes. Hardy ferns crown the retaining walls, and creep down to the water's edge, while irises of many kinds luxuriate in the water, and moisture-loving spiræas form big groups at the sloping ends of this quaint water garden. Osmundas grow finely here, and Agapanthus umbellatus is one of the features of the garden. Water lilies disport themselves in the central area, which is kept clear of other subjects for their special benefit. As an example of how to turn an unsavoury place such as a manure pit into a thing of beauty, and at small expense, this water garden at Barrow Court would be difficult to surpass.

THE APPLE SUCKER.

The article by Mr. A. Petts on "Garden Pests" has afforded me much interest, for I have for some years had occasion to devote a considerable share of attention to them, and especially to those which prey upon fruit trees. It is not possible, as the writer remarks, to deal with all the insects that prey upon garden crops, and I shall therefore not apologise for referring to some that were not mentioned.

There are one or two pests that are doing enormous harm, unknown to a good many, and one of these is the apple sucker (Psylla mali). Damage equal in extent, if not greater than that caused by aphides is often done to the apple crop by this pest. Until recent times, and, indeed, even occasionally at the present time, the injury sustained by the blossom was attributed to the action of frost, whereas it was in reality due to this destructive insect. The apple sucker is a small winged fly, green or greenish-yellow, and about 1-10th to 1-8th inch long. In the adult stage it does not seem to do much, if any damage, all being done in the larval and pupal stages. The eggs are laid in September and October on the young shoots and spurs and sometimes on the buds. With the advent of spring and the rise of sap in the tree, these eggs hatch into little larvæ, about the size of a pin's point, just discernible with the naked eye, and varying in colour from yellow to dark green; some that I saw last year on some standard trees of Worcester Pearmain were quite yellow, and some seen this year on the same variety on bush form are dark green. These larvæ at once make their way into the opening buds, and there commence to suck the life out of them. Particularly is this the case when, as often happens, it is a blossom bud which the larvæ enter, in some cases so



[Photo: Lindon Hatt and Son.

ONE OF THE WATER GARDENS AT BARROW COURT, NEAR BRISTOL.

crippling it that the flowers do not open. In other cases, where the flowers open, the larvæ so puncture and suck the stalks that the whole flower withers away just as if it had failed to set owing to the action of frost.

When we examine such a cluster of blooms, however, we shall find the cast nymph skins, and probably some imagoes as well, proving the source from which destruction came.

The apple sucker, like the aphides, undergoes an incomplete metamorphosis, various moults therefore take place between the larval and the imago, hence the cast-off skins one finds. During these moults are produced the characteristic globules and threads which we find at the axils of the flower stalks, and make it so difficult to reach the pest with a spray fluid, as the globules help largely to throw it off. Four to six weeks after hatching—that is, generally at the end of May—the last moult takes place, when the wings are liberated, and the insect ceases to be harmful so far as is known, until, of course, egg-laying recommences.

I have tried many washes in winter time for the purpose of corroding the eggs, but have not found any really successful, the most promising being the lime or lime and salt, which, though not corroding, serves to retard, if not prevent, hatching by smothering the eggs right up. It can only be a partial success, I fear, for the vitality of these small larvæ is very great. On one occasion last year I observed one walking along with a comparatively large piece of lime on its back. I have found the best results to follow the use of the nicotine spray in the spring, which, with careful handling, will thoroughly clear out the sucker where it is used.

It is as well, however, to spray as soon as the suckers are seen, as soon after hatching as possible, as at that period they are far easier killed than when they have been allowed to establish themselves in the axils of the blossoms and leaves. Mr. Theobald is of the opinion that they may then be killed with quassia and soft soap; if this be the case, it is only in the young and tender stage that the remedy has any effect upon them.

Last year I sprayed with this wash at such a strength that I severely burnt the foliage of the trees, and even then did not succeed in killing the suckers, only temporarily disabling them, from which they soon recovered. Even if Mr. Theobald's opinions are justified, and soft soap and quassia wash is proved to succeed, I question whether we can even then dispense with the nicotine wash, costly though it be, for the reason that the latter does, so far as I can see, absolutely no damage to the blossom when trees quite in full bloom are sprayed. Personally, I should not care to do this with soft soap and quassia, unless I knew something of the constituents of the soft soap.

There is another wash on the market which does most excellent work in killing apple sucker, but it is also open to the same objection, that, at the time when it is most necessary to be using it on the trees, one is debarred from doing so for fear of doing injury to the blossom.

There is no doubt that unless prompt and vigorous action is taken throughout the country in combating this pest, successful apple growing will become a thing of the past. **Fred W. Hammond.**

Brentwood.

PROFITABLE FRUIT GROWING for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, written for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

THE JAPANESE IDEAL.

It would seem that the reign of the Japanese garden in this country is to be a very real and lasting one. From the impressions one has gained of late, there is evidently a decided trend toward the Japanese style of garden adornment, and the idea is prevalent that the present-day desire for the Japanese garden is as yet in its infancy.

Already there are signs in the air, and one hears vague rumours of trips to Japan to study Japanese architecture in tea-houses, bridges, arbours, etc., of special engagements of Japanese artists to make certain of getting the true Japanese effects, of special importations of Japanese plants, stoneware, and curios, that one is inclined to wonder to what extent the new phase of garden adornment is going in this England of ours. There is so much to be said in favour of Japanese art as applied to garden decoration that one would not prejudice the least thought against its success in English gardens, but the main idea must ever be, to adapt the best phases of the Japanese garden for our own requirements, and not to become mere copyists of existing gardens. Taking the "Japanese" ideal for all that it is worth, we note that the dominant features are the bold, effective arrangement of rock, mound, and boulders, the artistic groupings of trees, shrubs, and plants, the ever-recurring use of pools, streamlets, and swamps,and a completeness of detail which is such a marked feature of Japanese gardening. The reproduction of existing bits of natural scenery on a smaller scale, is a notable idea carried out in many Japanese gardens. There you may have the bold cliff, crowned with its setting of dwarf pines, etc., the rising hillocks ablaze with glowing azaleas, a valleyed depression, with pools and tiny waterway, o'erspanned with one or more of those delightful curved bridges. A swamp of irises, gay in summer with a myriad soft-lit hues, the causeway of stepping-stones through the iris groups, which leads one away to a miniature jungle of bamboos, shrubs, and grasses. Suitable groupings of ferns, and reed, alpines,and flowering trees occur in suitable positions, just as they would in nature, and the beauty of the scene is emphasised by the fact that in all the garden there is no jarring note to disturb the complete harmony, one feature gradually passes into another, with just that pleasing grace which takes away the power of the would-be critic.

Such treatment in garden adornment gives an appearance of unlimited space to even a small garden, and properly carried out, will give artificial work an air of naturalness which Nature herself could not well object to. But, though the majority of Japanese gardens are picturesque scenic effects, yet it must be borne in mind that all Japanese gardens do not show the diverse characteristics of the one described.

Many of the larger gardens specialise particularly in certain groups of flowering subjects. The famous Wistaria Garden at Kameido, with its cascades, banks, and veilings of the magic violet-sheen of W. multijuga, is a case in point. True, one has rock, cliff, and waterways, but the great outstanding feature is the wondrous wealth of wistaria blossom, which in its season is indeed one of the glories of Japan. Others give the place of honour to the lovely cerasus (or cherries). The glowing azaleas, pæonies, or even chrysanthemums. Others again, like the garden of Hori-kiri, delight one with a glorious wealth of iris, swelling down a valley with its glowing, undescribable beauty of colourings. "A veritable furore of beauty;" "a colour-effect beyond imagination."

The Japanese garden-maker would dismiss as impracticable subjects many favourite plants which are largely grown in English gardens. They have their own ideas of floral form and beauty, and any flower that does not coincide with these ideas are out of the scope of the Japanese artist. And, as these ideas of floral form are rigidly adhered to by each successive generation of garden-lovers, aided by the love of the whole race for floral beauty, we feel that we can understand somewhat the reason of the high position that their favourites of the floral kingdom occupy.

And in the creation of a garden one must admit the painstaking perseverance of the Japanese garden artist. His aim is perfection of line and arrangement. Nothing is too much trouble. The selection of stones for the formation of a bit of rock-work would do credit to a first-class jeweller at work upon a royal coronet. Anything that does not meet with the approval of the discerning eye is placed aside as useless for the purpose in hand. And whether the worker is busy training one of those gnarled miniature trees, or is making a replica of a mountain scene, with the "great" Fujiyama itself in the background, one notes the same observant, detailed care. Then again, the "ideal" Japanese garden is a haunt of pleasure. It is a garden where one can live sunny, peaceful days during the warmer months. It will have its tea-house, with all its simple, charming accompaniments for the serving of light, dainty meals. There will be the quiet resting seats under the shadow of bamboos, where one can view the pools and waterway fringed with reeds and rushes, and gemmed with water lilies, the haunting groups of heaven-hued irises, and the "fire-lit masses" of azaleas clothing the rugged banks. There will be the quaint stone pathways, where one can walk in shadow and sunshine during the day, and which at eventide are diffused with the faint, soft lights emanating from "stone" and "swinging" lanterns. And, furthermore, one has the advantage of perfectly restful scenery, soothing to the wearied nerves, and possibly, the "garden bath," which was not the least charming feature of some of the gardens of "Old Japan."

But in the furtherance of this idea of the Japanese garden, let me impress upon the reader the value of proportion in arrangement. An undue preponderance of stone-ware, a too free use of tree or shrub groupings, a garden-house which becomes unwieldy in comparison with the size of the garden, an injudicious use of rock, will each and all take much from the beauty of the scene, and may possibly conduce to a grotesque effect.

Much remains to be done on the lines indicated, and whether one decides on a "typical Japanese garden," or what is equally charming, an "English garden which embodies some of the finest phases of Japanese garden art," they will find that both portray an interesting aspect of garden art, and both will do much to further horticultural progress.

Already the horticultural trader is finding out that he is being asked to provide Japanese plants, trees, and stoneware which were an unknown demand in the days that are past, and the wider outlook and the closer touch with the Far Eastern Empire should be productive of good.

One lesson which the Japanese teach might well be taken to heart by ourselves. That is, the utilisation of "native" plants. We in forming garden haunts of beauty have room for improvement in this matter.

P. S. Hayward.

ROSE PERGOLA AT STRATFIELDSAYE.

The illustration given herewith of the admirably furnished pergola which forms a highly attractive feature of the charming gardens of Stratfieldsaye Rectory can hardly fail to interest a large number of our readers. It is an excellent example of the type of pergola that has the merit of being simple, inexpensive, and admirably adapted for the display of the distinctive charms of rambling and other roses of scandent habit to the best advantage. The pergola has also the merit of being sufficiently substantial to bear its precious burden of flowers for many years, and it is of interest as showing that the genial president of the National Rose Society appreciates garden roses not less highly than he does exhibition roses, with which he has achieved so much success during the long period over which his career as a rosarian has extended. The pergola in the rectory gardens at Stratfieldsaye was constructed within a short period of Mr. Page-Roberts becoming settled in his new home, and it extends from within a short distance of the rectory to the entrance to the somewhat quaint church. The design is sufficiently shown in the accompanying illustration, and originally it was planted on one side with roses, and on the other with various climbing plants, comprising, among other subjects, several of the ornamental vines and Actinidia chinensis. This arrangement was regarded by Mr. Page-Roberts as somewhat unsatisfactory, and he removed the miscellaneous plants from the side of the pergola that had been devoted to them and replaced them with roses. It need hardly be said that the finest of the climbing roses have been utilised in clothing the pergola, but it may be mentioned that René Andre and Helene are especially conspicuous among the varieties that are prominent in the illustration.

Those who have had an opportunity of seeing the gardens of the Rev. F. Page-Roberts in East Anglia, and at Stratfieldsaye, are well acquainted with the fact that he has a strong affection for hardy perennials, and the fine border that flanks the pergola is the best possible proof that could be had of the success with which he cultivates them, and the taste with which they are arranged.

AN ADMIRABLY-FURNISHED ROSE PERGOLA IN THE STRATFIELDSAYE RECTORY GARDENS.

PREPARING ROSES FOR EXHIBITION.

The successful exhibition of roses can only be acquired by patience and experience. Of course, one must secure the right quality of bloom first, but many even then fail to put the flowers up to the best advantage. Only observation and care can teach one which varieties need cutting earlier than others, and in what stages of development they will travel best. Some roses need to be cut almost in the bud state, while others will remain perfect from the time they are culled from the plant. However careful one may be, a sudden change in the weather and temperature frequently upsets all calculations, and it is advisable to carry spare blossoms in varying stages of development of those sorts which expand most freely. Then one has to allow for the length and duration of journey.

It is well to cut late in the evening or very early in the morning. Quite a different flower would be needed when one is to travel from late afternoon until ten o'clock the next day, than if the exhibition tent is in your own district. The fresher the rose can be cut the better, but I would prefer not to cut them during too bright sunshine. Bright sun and an easterly wind—such as the farmer delights in for haying—is much against cut roses. However careful one may be to place them in water immediately, the flowers often grow less instead of larger.

Never set the roses up at home. There are certain to be alterations needed upon arrival at the show. Have boxes and tubes all ready, and the flowers placed about where you think they will need to be arranged, but leave the final touch until the last, when everything will look fresher. A little taste in the arrangement of colours goes a long way towards setting off the blooms to the best advantage, and neatness counts in adjudication.

Do not make the mistake of looking at your own box with partial eyes; our own geese are apt to look like small swans if we regard them long and favourably enough. Nor must we think of what a certain flower has been. That is not the question for the judges, but what it is at the moment they see it. I have often noticed what was undoubtedly a grand flower left in a stand after its chief phases of beauty had passed. Amateurs often fail here. They cannot lose sight of what a good specimen it has been.

Regulation boxes are used at almost all rose shows now, most of the societies being affiliated with the N.R.S. Fix the blooms up boldly, so that one can see all around them, when they will appear larger. Always have plenty of water in the tubes. I have tried a number of things in the water to help keep flowers fresher, but never really found any benefit therefrom. It is a good plan to cut off the bottom of the stems frequently with a sharp knife.

If you require large flowers the buds need to be thinned as soon as they can be picked out.

A. Piper.

AMONG THE ALPINE FLOWERS.

"The fairies have been busy while you slept;
They have been laughing where the sad rain wept,
They have taught beauty to the ignorant flowers;
Set tasks of hope to weary wind-torn bowers."
—E. Nesbit.

After a long duration of glorious weather, in which every flower in bloom seemed to laugh with pleasure, the inevitable change came, and "rain, rain, rain," was the burden of the song. But that, also, has almost passed away, and we see where "the fairies have been busy" among the flowers. Some of our favourites have had their blossoms scattered for the year, but others have been brought forth to give pleasure to us, and we find much to observe as we wander through the narrow paths, taking note of what the rain and the succeeding sunshine have had to yield us.

Sun Roses.

Sun roses, which a few days ago bewailed the absence of their lover, now rejoice in his presence and his gaiety. They open their petals and seem to smile upon the world, as if they thought that the time of their discontent was over, and all would be well. What delightful things are these when on a sunny bank! Each morning they open a fresh supply of blossoms, and each afternoon or evening, as the case may be, they cast them off as one would cast off rejected raiment. Next morning they are covered with bright flowers again. And so they go on for long, provided their requirements are satisfied. And these are few. Give them a dry bank, a sunny place, some stones about their roots to keep them from excessive drought, and they are happy. Some have an impression that they require rich feeding, but that is an error. They are like the "country mouse" in their fare. Yet they do not flourish, or, at least, do not give the same satisfaction, when they are in too dry a place. I find that they soon drop their petals if in such a place, and the point is how to hit the golden mean. Then they like shelter from wind also, and a sheltered place will sometimes mean hours of difference in the duration of bloom; the plants exposed to wind losing all their flowers in a few hours in stormy or gusty weather.

As to varieties, their name is legion, and we may choose almost any single-flowered one sold by a firm of repute as a named variety with confidence that we are sure to obtain a helianthemum which is worthy of its room. But we must have a few double varieties, and the first choice of these should be made with H. venustum plenum, or H. amabile fl.-pl. (called Mrs. C. W. Earle by some), with its vivid red flowers held well up to the light. Then we must add its daughter flower, Jubilee, which is bright yellow, and its bronzy sister, Old Gold. All are akin, the two last being derived by sports from the first, and all alike have the merit, denied to the great number of the double helianthemums, of holding their flowers well upwards. The others require to be planted high on the rockery, the weight of the blossoms bearing down their stalks, too delicate and weak to hold up the double flowers.

Ofttimes these flowers can be bought in pots, and so can be planted out at any time. One word of caution in planting should be added, this being that plenty of room should be given to each plant. The sun roses are most ornamental when three feet or so across.

Ajuga genevensis Brockbanki.

Ajugas, or bugles, are not extremely popular among the lovers of alpine flowers, although some of the species and their varieties are excellent for many purposes. The Genevan one is seldom seen, and its form, called Brockbanki, is met with at the present time in very few gardens. In June and July it is very ornamental, with its deep blue flowers, in longish spikes for the height of the plant, the deep, almost cobalt blue, harmonising well with the dark green foliage. Its only fault is that it is inclined to creep a little at the roots, but it is not excessively aggressive in this respect, and is not thus difficult to keep within bounds. Its height, with me, is generally about nine inches, and it is a plant which has never lessened in one's estimation during the many years I have had it in my garden. It appears to be very easy tempered in every way, objecting to nothing almost in the way of soil, flowering as well in shade as in sun, and standing dry weather well, although it has evidently a liking for a reasonable amount of moisture at its roots. It is also good for the front of the border.

Dianthus alpinus.

The alpine pink, Dianthus alpinus, is one of the gems of a genus which has, one may say it with all respect, a perfect title to the name of the "divine flower," a literal translation of the name of dianthus, from dios, divine, and anthos, a flower, the name given by Theophrastus to the race. It is a gem indeed, and all who can grow it delight in and are proud of its lovely carmine, crimson-dotted flowers. It is one of the alpines coveted by everyone, and one which, although capricious and incomprehensible in some of its requirements, it is not at all difficult to do in many gardens. It seems to me to like an almost level place on the rockery, with stones about it sufficient to keep the soil moist, but still in a soil which is of freest drainage. Only a few inches high, it is an exquisite flower, worthy of all care, and easily purchased in pots, and also easily raised from seeds. As for the white variety, well! one must agree with a certain alpine pundit who tells us that it "is a blank disappointment" to him. We have plenty of good white pinks, and when we see this D. alpinus albus beside its sister we are truly disappointed with it. But the typical alpinus is a perfect gem.

Dianthus cæsius.

The good old Cheddar Pink, Dianthus cæsius, has given us so many descendants, some possibly hybrids, that its identity is almost lost in gardens. It is beautiful indeed, with its fringed pink flowers, and there is hardly one of its progeny which is not worth possessing on the rockery. They make good masses of grey foliage, and give so many flowers that they are a good "stand-by" if we have little else in these days of late June and early July. Although a lime or chalk lover, D. cæsius and its varieties are all so accommodating that they can be cultivated successfully as well on the sandstone or granite as on the chalk rocks of their own home.

Other Flowers.

But we have many flowers besides these, for have we not masses of sedums, rose, and yellow, and white, and various shades between? And we have yet late saxifrages, giving plumes or spikes of white or spotted flowers. There are sempervivums, sending up great fat stems, and, while the blossoms carry death to the rosette which blooms, making a great effort to startle the world with their wonderfully starry flowers in such great heads. From bronze and green, from silvery and woolly rosettes, rise these strange-looking flowers, which we look upon with mingled pleasure and regret—pleasure beca their character—regret because the plant dies in giving birth to this galaxy flowers. Then there are claytonias, niums, erodiums, poppies, dwarf ver calceolarias of approved hardihood, and host of other blossoms of the summer time, gay or quiet in their colouring, but mostly fascinating in their mien. S. Arnott.

ONION DISEASE.

In the present season large areas of onions are to be found diseased, with "blind" or "bull-headed" plants, and it is often noticed that one portion of a bed is affected while the remaining part is healthy.

The mischief is every extensive, and differs from the disease caused by the Onion Fly (Phorbia cepetorum). On amination of the diseased bulbs by a powerful microscope, every plant, on being open, will be found to be infested by eelworm (Tylenchus devastatrix).

Onion plants attacked by eelworms early stage of their growth have sw and twisted leaves, in which the nem are found in great numbers. When bulb is more advanced it swells unnatu in the upper part, and becomes soft pulpy. It splits open, the outer folds away, and the whole bulb soon decays. the growing parts of the bulbs eelw are found in all stages of existence, large colonies of eggs. The diseased p should be carefully taken up with a three-pronged fork, used in market dens, or some other handy tool, so every particle of bulb and leaf, and the fibrous roots are removed. These be at once burned. Do not leave the lying on the ground, because either the worms or the eggs will be transferred to the soil. The eggs may also be carried by surface water to other parts of the garden.

Eggs containing the embryo eelwor be kept dry for six months without their power of hatching, and young worms have the power of resuming tion and active life after they ha mained in a perfectly dry condi dead plant tissues, or in a dry between two and three years. It is rent that this faculty enormously in the chances of the distribution and s of this pest, which may be carried gardens in the dried-up state with made from infested clover or straw

It may be said at once that this pest extremely difficulty to deal with. A rotation of crops should most certainly be selected that will allow as long an interval as possible to elapse before another onion crop is planted on infested ground. subject to this pest and intended fo should be very deeply dug, not two spits, and in the winter. A of quicklime or gas lime at the rate ton per acre, or 14lb. per pole, worked into the soil during the In the spring, after the onion tablished, apply, as a top-dre ture of quicklime and soot in the tion of one bushel of soot to two of lime. This should be broadcasted damp or rainy weather, and lightly in between the onion rows as soon as the soil is dry enough. J. J. Willis.

Harpenden.

A Good Crop of Almonds. cording to "The Globe" 360lbs. have been gathered from the alm in the Bishops Park, Fulham, and sold ten guineas.

THE MALE FERN.

The Male Fern (Lastrea filix mas) is one of the so-called Buckler fern family, the little skinlike covering over the spore heaps at the back of the fronds being of a kidney shape, somewhat resembling an ancient buckler or shield. The Shield ferns (Polystichums) are, however, a distinct family, having the said cover or indusium quite round and attached to the frond by a very short central stalk, or rather boss. The Male Fern is probably the commonest native fern we have, since it is one of the least exacting as regards soil or the general conditions which determine fern growth. In many parts of the country it grows freely in the hedges and ditches by the road side, and in abundance in woods and shady glens.

It can hardly be confounded with any other species, unless it be with its relative L. montana, the Lemon-scented Fern, but even from this it differs in the fact that the side divisions of the frond only begin about one-fourth the way up, commencing as fairly long ones surmounting a bare stem, which then continues to form the midrib of the frond. These divisions are divided once again into pinnules with toothed edges, the frond thus resembling a coarse lance-shaped feather tapering off to an obtuse point. L. montana, on the other hand, has its side divisions commencing as short lobes at the ground level, hardly any bare stalk there being seen, while a distinct and agreeable lemon-like odour, perceptible when a frond is drawn gently through the hand, plus a much lighter yellowish-green tint, also distinguishes this clearly from the Male Fern we treat of. The Male Fern is one of the so-called Shuttlecock type, i.e., the fronds spring in a circle from a central caudex or rootstock. They rise in the spring, and as they ascend and uncoil, the tip hangs down on the inner side like a shepherd's crook, while in L. montana the stem rises erect with a spiky ball at the top. This bending determines also a difference between the Male Fern and the Shield Fern, since with the latter the frond tip turns over and hangs backward, like a crook turned the reverse way, so that even before the fronds clearly indicate the species to a beginner, these peculiarities establish the species.

In the autumn, the fronds of the common Male Fern develop a weak spot near the rootstock, and fall down, perishing later on during the winter. This is the rule, but there are exceptions, for it has been found that the Male Fern has two sub-species, viz., L. pseudo-mas and L. propinqua; and L. pseudo-mas, or the Hard Male Fern, is much more robust and tougher in texture, so that in protected situations it retains its fronds through the winter and well into the following season. L. propinqua, on the other hand, is even softer and more thoroughly deciduous than L. filix mas; it is distinguished by somewhat crispy sub-divisions, and other small differences which we need not define here, as it only occurs locally. As we have said, the Male Fern is not dainty, and consequently as a cultivated plant or even as a neglected one in the open, it holds its own, and in time forms robust clumps, since it has a knack of producing lateral offsets, which soon assume full size and transform a single crown into a bush.

In this connection, we may mention that this has a somewhat dwarfing effect on all the plants so crowded, and the only way to grow the fern to the best advantage is to remove these and keep the original crown free from their competition for root room and frond space. Each such offset can be pulled away with its own bunch of roots, affording thus a ready means of propagation. Owing to its easy growth, nearly all gardens, and particularly suburban gardens, show specimens of this species. There must be many thousands in London suburban gardens, and this brings us to the curious consideration that, despite this general appreciation of the common type, the many far more beautiful varieties of it which exist are only seen in recognised collections.

Few people seem to be aware that there are forms of this bearing beautiful tassels at every tip, such as cristata, polydactyla, grandiceps, ramo-cristata, ramosissima, ramulosissima, and many others of the crested section; a number of beautifully dwarfed varieties, in which the charm of the larger ones is condensed into compact little plants of a few inches in height, gems for window or case culture; and a host of others in which the make of the fronds, their cutting, and habit is very different from the common type from which one and all sprang, and whose hardiness and ease of culture one and all have inherited. Most of these are obtainable for a few pence apiece, and once acquired are a permanent possession, plus the power, common to most, of the lateral propagation above alluded to, and the faculty of reproducing themselves truly through their spores if their owners care to devote themselves to that most interesting branch of fern culture, spore raising. Of late the popular interest in these beautiful varieties of this species, and of most of the other species indigenous to Great Britain and Ireland, has greatly increased, and the absurdity is being recognised of growing only what the connoisseur regards as the weed forms, when for a small outlay a collection of many different forms could be made to replace a monotonous repetition of, it may be, scores of the same and inferior type.

A well-grown specimen of L. f.-m. cristata, known as the King of the Male Ferns is before us as we write. We have had it over 30 years; it is in a huge pot, has a trunk à la Tree Fern, nearly eighteen inches high, and a magnificent circlet of fourteen 4ft. fronds bending symmetrically with hundreds of fine tassels at all terminals. This is of the hard sub-species L. pseudo-mas, and often retains a double set of fronds, those of the previous season remaining perfectly green long after the succeeding circle of new ones is perfected. Such a specimen is worthy of a place of honour in any conservatory, and not far from it is a row of little pots accommodating a dozen or more seven or eight-inch dwarfs of equal beauty on a smaller scale. If our readers would obtain a specimen or two of this "King," and plant it among the meaner subjects in their gardens, they would speedily determine to oust a host of the latter in favour of the diverse and more charming forms we refer to.

Chas. T Druery, V.M.H., F.L.S.

MR. CONWAY JONES'S CHAMPION SET OF TEA ROSES AT THE N.R.S. EXHIBITION, JULY 2.

FEEDING WALL FRUIT TREES

The growing of fruit trees against walls being in some ways unnatural, they need more attention in this respect than trees in the open. It must be borne in mind that their feeding area, instead of extending to a radius of several feet or yards all round the tree, is limited to one-half of a circle, by reason of the boundary formed by the foundations of the wall—unless the latter has been built on arches, which is not very likely in the case of the ordinary garden wall—none but large and old trees, such as wall pears, ever pushing their roots to the other side of the wall to any good purpose. Moreover, that part of this feeding area next to the wall is usually in a dry condition even when the ground elsewhere is wet. Both of these conditions restrict the food supply of the tree, which needs to be larger than that available for trees in the open, because, owing to the general practice of protecting wall fruit trees from frost, it is no uncommon thing to have good crops year after year, sometimes even, as in the case of peaches and nectarines, a blank year being quite exceptional. This does not occur with any sort of fruit in the open, with the exception of bush fruit. The combined result of these conditions is often seen in enfeebled trees, making but poor growth, and producing small fruit or a very light crop.

NEW HYBRID TEA ROSE COUNTESS OF SHAFTESBURY.
Exhibited by Mr. Hugh Dickson at the N.R.S. Show, July 2, and awarded gold medal.
Flowers two-thirds natural size; colour, bright rose-pink.

When to Feed.

The season of the year at which trees are fed, and the character of the manure applied, must be determined by careful observation of the tree. If a tree is bearing little or no fruit, and is making healthy young growth much in excess of a foot in length, no manure should be given to it that year. If, however, though making good growth, it is bearing a heavy crop of fruit, then the application of liquid manure after the fruit has stoned, or when the fruit commences its final rapid swelling before beginning to colour (that is, the ripening colour as distinct from the dark red colour of apples, peaches, etc., while still in a very immature state), will have the effect of increasing the size of the fruit considerably, and aiding the tree at the same time. Some liquid manure may also be applied after the fruit is gathered, and the tree pruned and nailed up for the winter, as I believe in doing as soon as the fruit is picked, from the end of August onwards. This helps the fruit buds for the next season to swell up and become fully developed, and may make the difference between the blossom setting freely and proving abortive, while there is little if any danger of the tree starting into fresh growth.

Liquid Manure.

Liquid manure, too, of any sort, especially the drainings from a farmyard or stable, applied during the winter, would be beneficial to such a tree, that is, one bearing well, and making moderate growth. If, however, the tree is making very strong growth, as well as producing a good crop of fruit—not a general occurrence—then it would be better to give a good soaking of plain water only two or three times during the summer, and perhaps once after the fruit has been gathered. Though, as just stated, it is not usual for a tree to make unduly strong growth and produce good crops of fruit at the same time, some of the strong-growing plums, especially the gages, sometimes combine the two, especially in their early years. I have a tree of Oullin's Golden Gage on a wall, and I had to lift it two successive years before I could get it even to flower. The last two years it has produced heavy crops of the finest fruit, and it still makes such strong growth that I have never yet given it any liquid manure. Still, I give the tree a good soaking occasionally with plain water both in winter and summer.

Autumn Dressings.

But there are trees on most garden walls which produce good crops year by year, and make less and less growth, and this leads to a state in which the tree makes very feeble growth, and produces little or no fruit, or only once in two or three years. Here something more is necessary, and with care, such a tree may be regenerated in a couple of years. Towards the end of September or early October the surface soil should be carefully removed within a radius of four to six feet from the stem, and sufficiently deep to expose a good many of the surface roots, the soil being carefully worked away from them with a small hand fork. Then there should be worked in amongst the roots and spread over them any good soil that can be obtained, such as fresh, rich turfy loam, or a mixture of this and old cucumber or marrow bed. If this is watered in fresh root fibres will be formed in the new material before the winter, and the tree will probably make much better growth, and even take on a new lease of life, especially if this treatment is accompanied by some shortening of the branches. A mulch should be put over the new soil when winter approaches, and removed when the sun begins to get warm in March, liquid manure being given during the winter and throughout the summer if the growth of the tree is not very strong.

Applications of Lime.

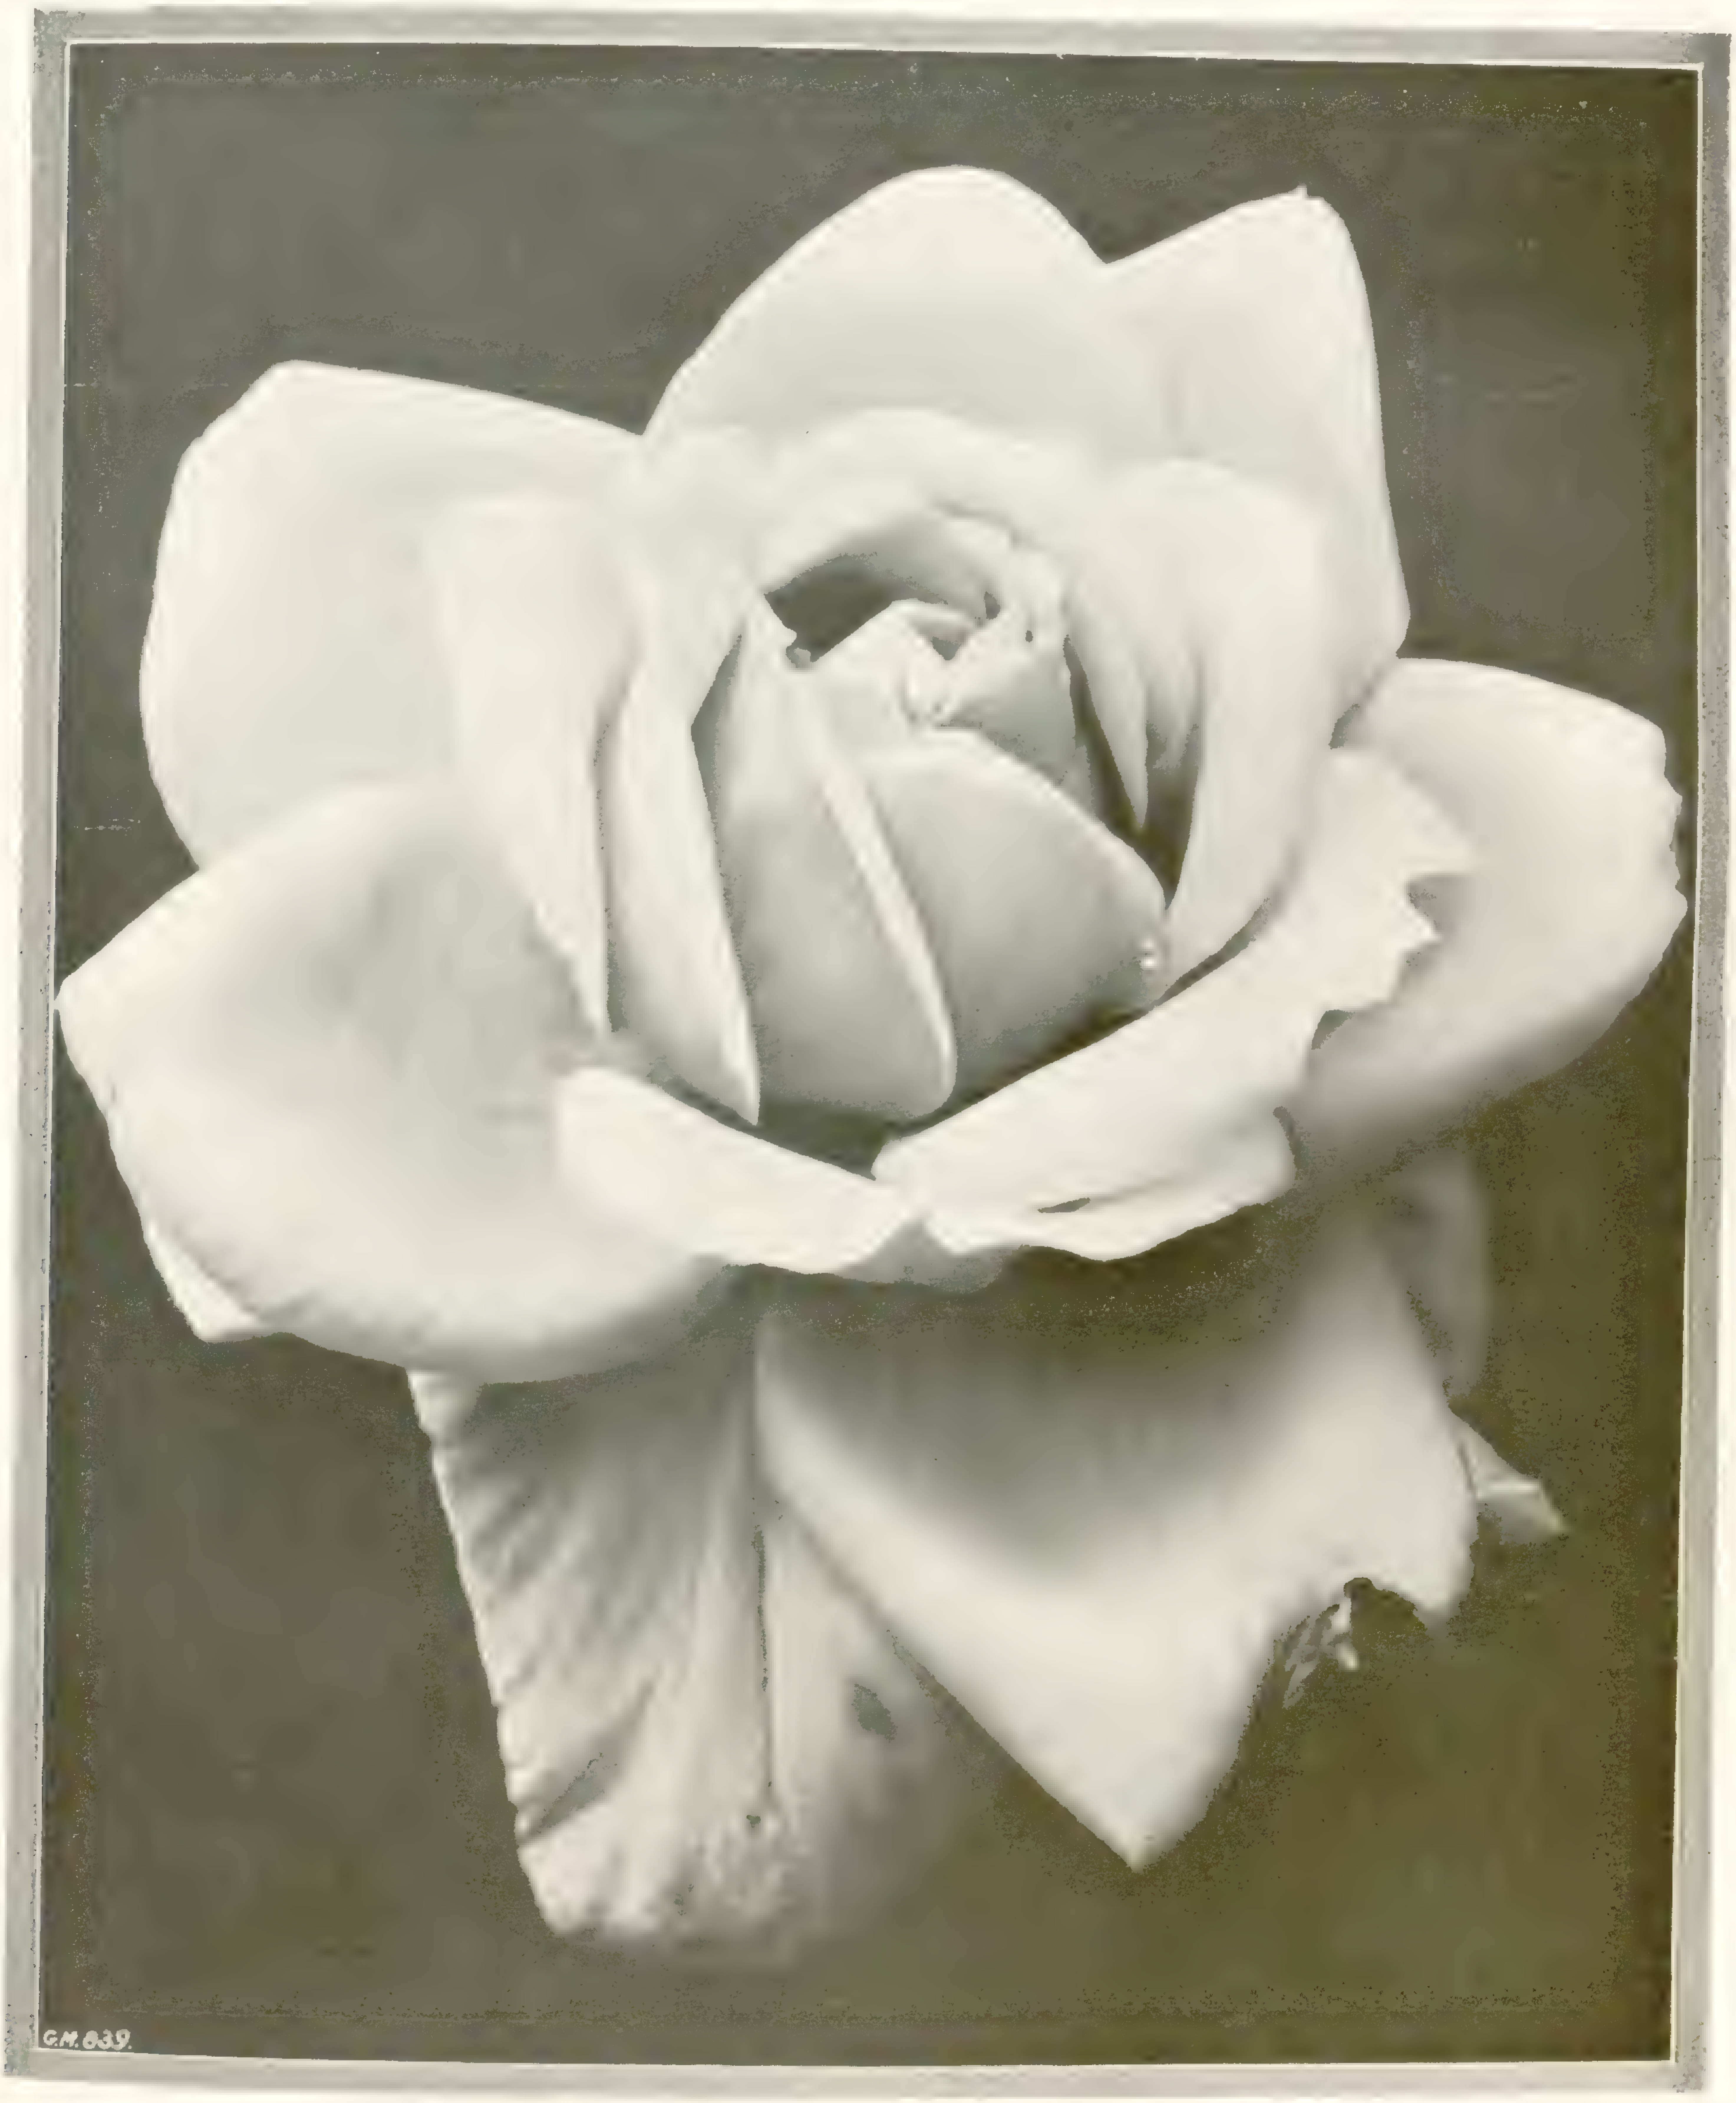
But liquid manure and farmyard or stable manure are mainly nitrogenous, especially the former, neither of them containing much of the elements of lime and phosphorus, which are scarcely less important to fruit trees, their absence sometimes accounting for their enfeebled state. All stone fruit trees especially need lime, and if the soil is naturally poor in this constituent, they will soon become exhausted or frequently rest from bearing, unless lime is applied in some form or other. We probably do not realise the amount of soil material that is removed by a tree in producing a good crop of stone fruit. Most garden soils are more or less poor in lime, even when the original soil was not so, and it is a good thing to apply basic slag in the autumn at the rate of two ounces to the square yard, and lightly hoe it in, as this supplies both lime and phosphates. This, however, is not so effective on light soils, and on such it would be better to apply a dressing of lime in the autumn followed by 26 per cent. superphosphate of lime early in the spring at the same rate as that recommended for the basic slag. The reason trees rest alternate years, or two years out of three, is often because they have exhausted the supplies of lime within reach. Phosphate has the effect of inducing short-jointed and fruitful growth, and is thus the best plant food which can be applied to trees making a fair amount of growth, though, as stated above, nitrogen is essential for [illegible] vigour of growth.

Deficiency of Potash.

On garden soils which have been given animal manure for many years there is not generally a deficiency of potash, but where trees have been established for a number of years they may easily have exhausted the available stores within reach, and as it is this constituent which is regarded as primarily responsible for the colour and flavour of fruit, especially the former, we cannot afford to neglect it. Farmyard manure contains a fair amount, and liquid manure made from rich guano usually contains some, but with old-established trees these sources may be well supplemented once in two or three years by a dressing of kainit, a cheap potassic manure, ten or twelve per cent. of which is actual potash. It should be applied in the autumn at the same rate as recommended for basic slag, sprinkling it over the soil as far as the roots are expected to extend, and lightly hoeing it in.

Observations.

It is often asked by inexperienced amateurs whether fruit trees should be manured, and, if so, what manure should be used. It will be gathered from the above that no general answer to such inquiries is possible, and that each tree should be supplied according to its needs, the latter being ascertained solely by careful observation of the growth of the tree. As a rule, trees receive too much manure in their early days, and too little when they are bearing heavy crops of fruit, and we should try and reverse this practice. When the fruit has been gathered from a tree many seem to take no further interest in that tree until they look for blossom in the following spring, and that is a great mistake, and the cause of non-success with many trees. After the fruit has been gathered it is too late to alter the amount of fruit buds for next season, but upon our treatment of the tree may depend the fertility or otherwise of the blossom, an exhausted tree not having the power to properly develop its embryo blossom within the fruit buds, either the pollen or the ovules being defective. Alger Petts



H.T. ROSE MADAME MELANIE SOUPERT.

A superbly-developed bloom of this fine rose, for which Messrs. McGredy and Son were awarded the silver medal for the best bloom of hybrid teas exhibited in the trade classes at the N.R.S. Exhibition, July 2; colour, soft cream-yellow, with deeper centre.

SPRAYING TRIALS AT THE ROYAL SHOW.

A few days before the Royal Agricultural Show at Gloucester a number of farmers, fruit-growers, and others met in the orchard of Mr. Martin Chart, at Hucclecote, to witness what proved to be a very interesting trial of apparatuses for spraying purposes. This is the first time a competition of the kind has been arranged by the Royal Agricultural Society, and the results were in every way encouraging to the promoters. It was evident from the interest taken in the proceedings that spraying, first as a means of checkmating insect and fungoid attacks on fruit trees, and secondly for the purpose of lime-washing walls and buildings, has come to stay, and people are beginning to realise that where fruit is grown, or there is much lime-washing to be done, a spraying apparatus is an essential part of the outfit.

The judging was in the hands of Messrs. G. Champion, of Maidstone, and Mr. C. H. Taylor, of Worcester, with Mr. F. S. Courtney as consulting engineer, and every praise is due to them for the way in which they stuck to what proved to be a long and tedious task. In the first class two prizes of £20 and £10 were offered for the best movable plant for spraying fruit trees and bushes in large plantations, to be worked by steam, petrol, or mechanical power. Clean water was first used, and then lime-wash, and though the latter served the purpose of testing the machines, the material used, and the method of mixing came in for adverse criticism on part of those present who are experienced in spraying with lime and Bordeaux mixture. Four machines were put on trial in this class, and the first prize went to Messrs. Weeks and Son, Lim., Maidstone, who had a powerful and economical apparatus, driven by a paraffin oil engine, which showed excellent capacity for dealing with a large number of trees in a short time. A main pipe was laid between the trees, and to this branches were attached, which threw fine sprays to a considerable height and distance. Messrs. Drake and Fletcher, of Maidstone, won the second prize with a powerful and compact apparatus, the barrel containing the insecticide being attached to the engine. Another apparatus in this class was one from Messrs. Duke and Ockenden, which was specially designed for getting to the tops of tall trees. The petrol engine and the receptacle for the insecticide were mounted in a waggon that was also provided with a wooden tower, and from the top of this the spray jet was manipulated. A spray jet called the "Mystery," was used by this firm, and it struck us as being an excellent contrivance for throwing a fine spray. The plant used by the Weald of Kent Engineering Company was a very handy apparatus, so far as the engine was concerned, but the fact that the tub containing the liquid had to be moved by hand was against it in point of portability.

MRS. ORPEN'S FIRST PRIZE BASKET OF ROSES (IRISH ELEGANCE) AT THE N.R.S. EXHIBITION, JULY 2.

For the best machine worked by hand-power two prizes of £10 and £5 were offered, and it was neither fair to the exhibitors nor the judges that small knapsack sprayers should have to compete with machines of greater capacity on wheels. Here, again, Messrs. Weeks and Son, Lim., were placed first with a sprayer furnished with a wooden tank, a good pump, and ample arrangement for pipes and jets. This was undoubtedly one of the handiest and best-finished machines exhibited. Messrs. Drake and Fletcher won second prize with a handy, powerful, and portable machine, and there were several others well worthy of mention. We were much struck with the sprayers displayed by Messrs. R. Burland and Sons, Wigan, which are particularly adapted for lime spraying. No. 1 is a handy little machine on wheels, and No. 2, which is mounted on runners, is good for getting about amongst trees under conditions unfavourable for wheels. No. 3, which is mounted on a wheelbarrow, is also a very portable and powerful sprayer.

Messrs. Llewellins and James, Lim., Bristol, were represented by a useful machine with a metal tank and good pumping power. An apparatus fitted with handles for carrying about, a powerful pump, a number of pipes, and still more jets, was shown by Messrs. Liversedge and Co., of Evesham, but it did not succeed in obtaining an award. The Weald of Kent Engineering Company showed a sprayer on wheels which displayed considerable power, but the waste of insecticide from the jet came in for some critical comments. We were very much taken up with three sprayers shown by Messrs. Marshall and Philip, Aberdeen. They struck us as being particularly light, handy, and portable, and one of the galvanised tanks was lined with copper for using sulphate of copper solutions. The hydraulic sprayer shown by Messrs. Duke and Ockenden had plenty of power, and did its work well, but the receptacle for holding the insecticide was not attached to the machine, which naturally told against its portability.

There was a number of knapsack sprayers on trial, and it was a great pity they were not put in a class to themselves. The [illegible] Distinguishing Company were represented by a number of automatic sprayers, well adapted for garden and greenhouse work, and the Four Oaks Undentable Syringe and Spraying Machine Company sent several of their well-known sprayers. Mackie's, Lim., Reading, showed several specimens of the sprayers that are well known to gardeners and fruit-growers, and in general use, and in the way of novelties a good deal of attention was paid to the French machines, shown by Messrs. Besnard, Maris, and Antoine, Paris. One particularly useful sprayer was a knapsack with an arrangement for fitting a long lance, and the Frenchman who manipulated the apparatus demonstrated its capacity for spraying standard trees of moderate height. A very ingenious apparatus was that shown by Messrs. Mayforth and Co., London. The sprayer was fitted with pipes and jets, suitable for spraying charlock and potatoes, and there was also a device attached to the sprayer for making and applying paraffin emulsion in the process of spraying.

The above is a general outline description of the sprayers used, and the proceedings which occupied two days, were followed with close interest. In short, we look upon these interested trials of this kind as being extremely useful, and we hope they will be continued in the future. Both the place and the material provided by Mr. M. Chart were of an ideal character, and, though there was room for some criticism, the trials as a whole were of a highly educational character.

BIG CROPS OF MELONS.

If Mr. Garner had opened his notes on this subject by saying "The majority of cultivators did not, ten years ago, [illegible] many melons from a given space as they ought" I should have agreed with him, but when he says cultivators "do not [illegible]" etc., I join issue with him, and [illegible] many melon-growers saying Mr. Garner can not be very well conversant with present-day practice.

The cordon system of melon culture is becoming quite old. I do not remember an instance of any other method being practised in gardens that I have visited for a long time. This plan has much to recommend it, not only in the number of fruits obtained in a given space, but in the extended season that such a system offers, and the more varieties one can grow the longer the season of ripe fruit, even from one crop.

E. Molyneux.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

CYMBIDIUMS.—Many of the species and hybrids of the genus cymbidium will now be rooting, and the plants should be repotted or top-dressed without delay. It is desirable where these plants need repotting to see that ample clean drainage is used. The plants belong to the thick-rooted section of orchids, and are therefore gross feeders, and during the season of active growth every attention must be given to proper drainage so that there is no possibility of stagnation. The compost we find suitable is about equal portions of fibrous loam, osmunda fibre, or good peat, and chopped sphagnum moss. Sufficient broken crocks should be added to render the compost porous. Water all freshly-potted plants as soon as repotting is completed, and keep them well shaded for a few weeks, and the atmosphere about the plants should be kept in a humid condition. Spraying overhead will be beneficial whenever the outside conditions will admit of syringing being done.

PHAIO - CYMBIDIUM CHARDWARDIENSIS does well and flowers most satisfactorily when treated under the same conditions as the phaius. It should be annually repotted, and as the new growths have now advanced to the stage when the young roots make their appearance, the plants should be carefully turned out of their pots and repotted. The roots of this plant are exceedingly fleshy and brittle, so that care must be exercised when removing the old potting compost; select clean pots, and provide ample drainage; the potting compost should be of the kind previously advised for phaius.

SEEDLING DENDROBIUMS, CATTLEYAS, ETC., pricked off early in the spring, will now be rooting freely, and where they were put in store pots (several together) they should now be potted off singly into 2in. pots. If we are to flower our seedling orchids within a reasonable time, it is desirable that we give them every encouragement to make the desired progress. In the earlier pottings the object is to obtain as much advance in growth as possible, so that whatever material is used should be of an open and porous nature. Firm potting should be avoided, as the looser the material the better the roots enter into it, and with abundance of roots satisfactory growth may be anticipated. It is only by constantly attending to the requirements of the young plants that we may hope to obtain early flowering. We find that a compost of about one-half finely-broken leaves, intermixed with equal proportions of chopped peat and sphagnum moss, and sufficient sand added to render the compost porous, suits the seedlings well in the early stages of growth; but, as the plants grow older the leaves are reduced, and more peat and osmunda fibre used until the ordinary potting compost is reached at the time the plants attain flowering size. — H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

PALMS.—When largely used in the mansion and in the unfavourable atmosphere of public rooms, palms should receive special attention, and, in common with subjects grown in warm houses, be frequently sponged to keep them clean and healthy. Any leaves injured or ragged at the points should be neatly trimmed; this, I must confess, in no way improves the appearance, but of necessity must at times be done. When the plants can be top-dressed by the removal of about one inch of surface soil, add good loam, and a little sand to keep it from setting hard, and about a dessert spoonful of a good fertiliser to a six-inch pot. Use tepid water for the first watering, and in sufficient quantity to well saturate the whole mass of soil and roots.

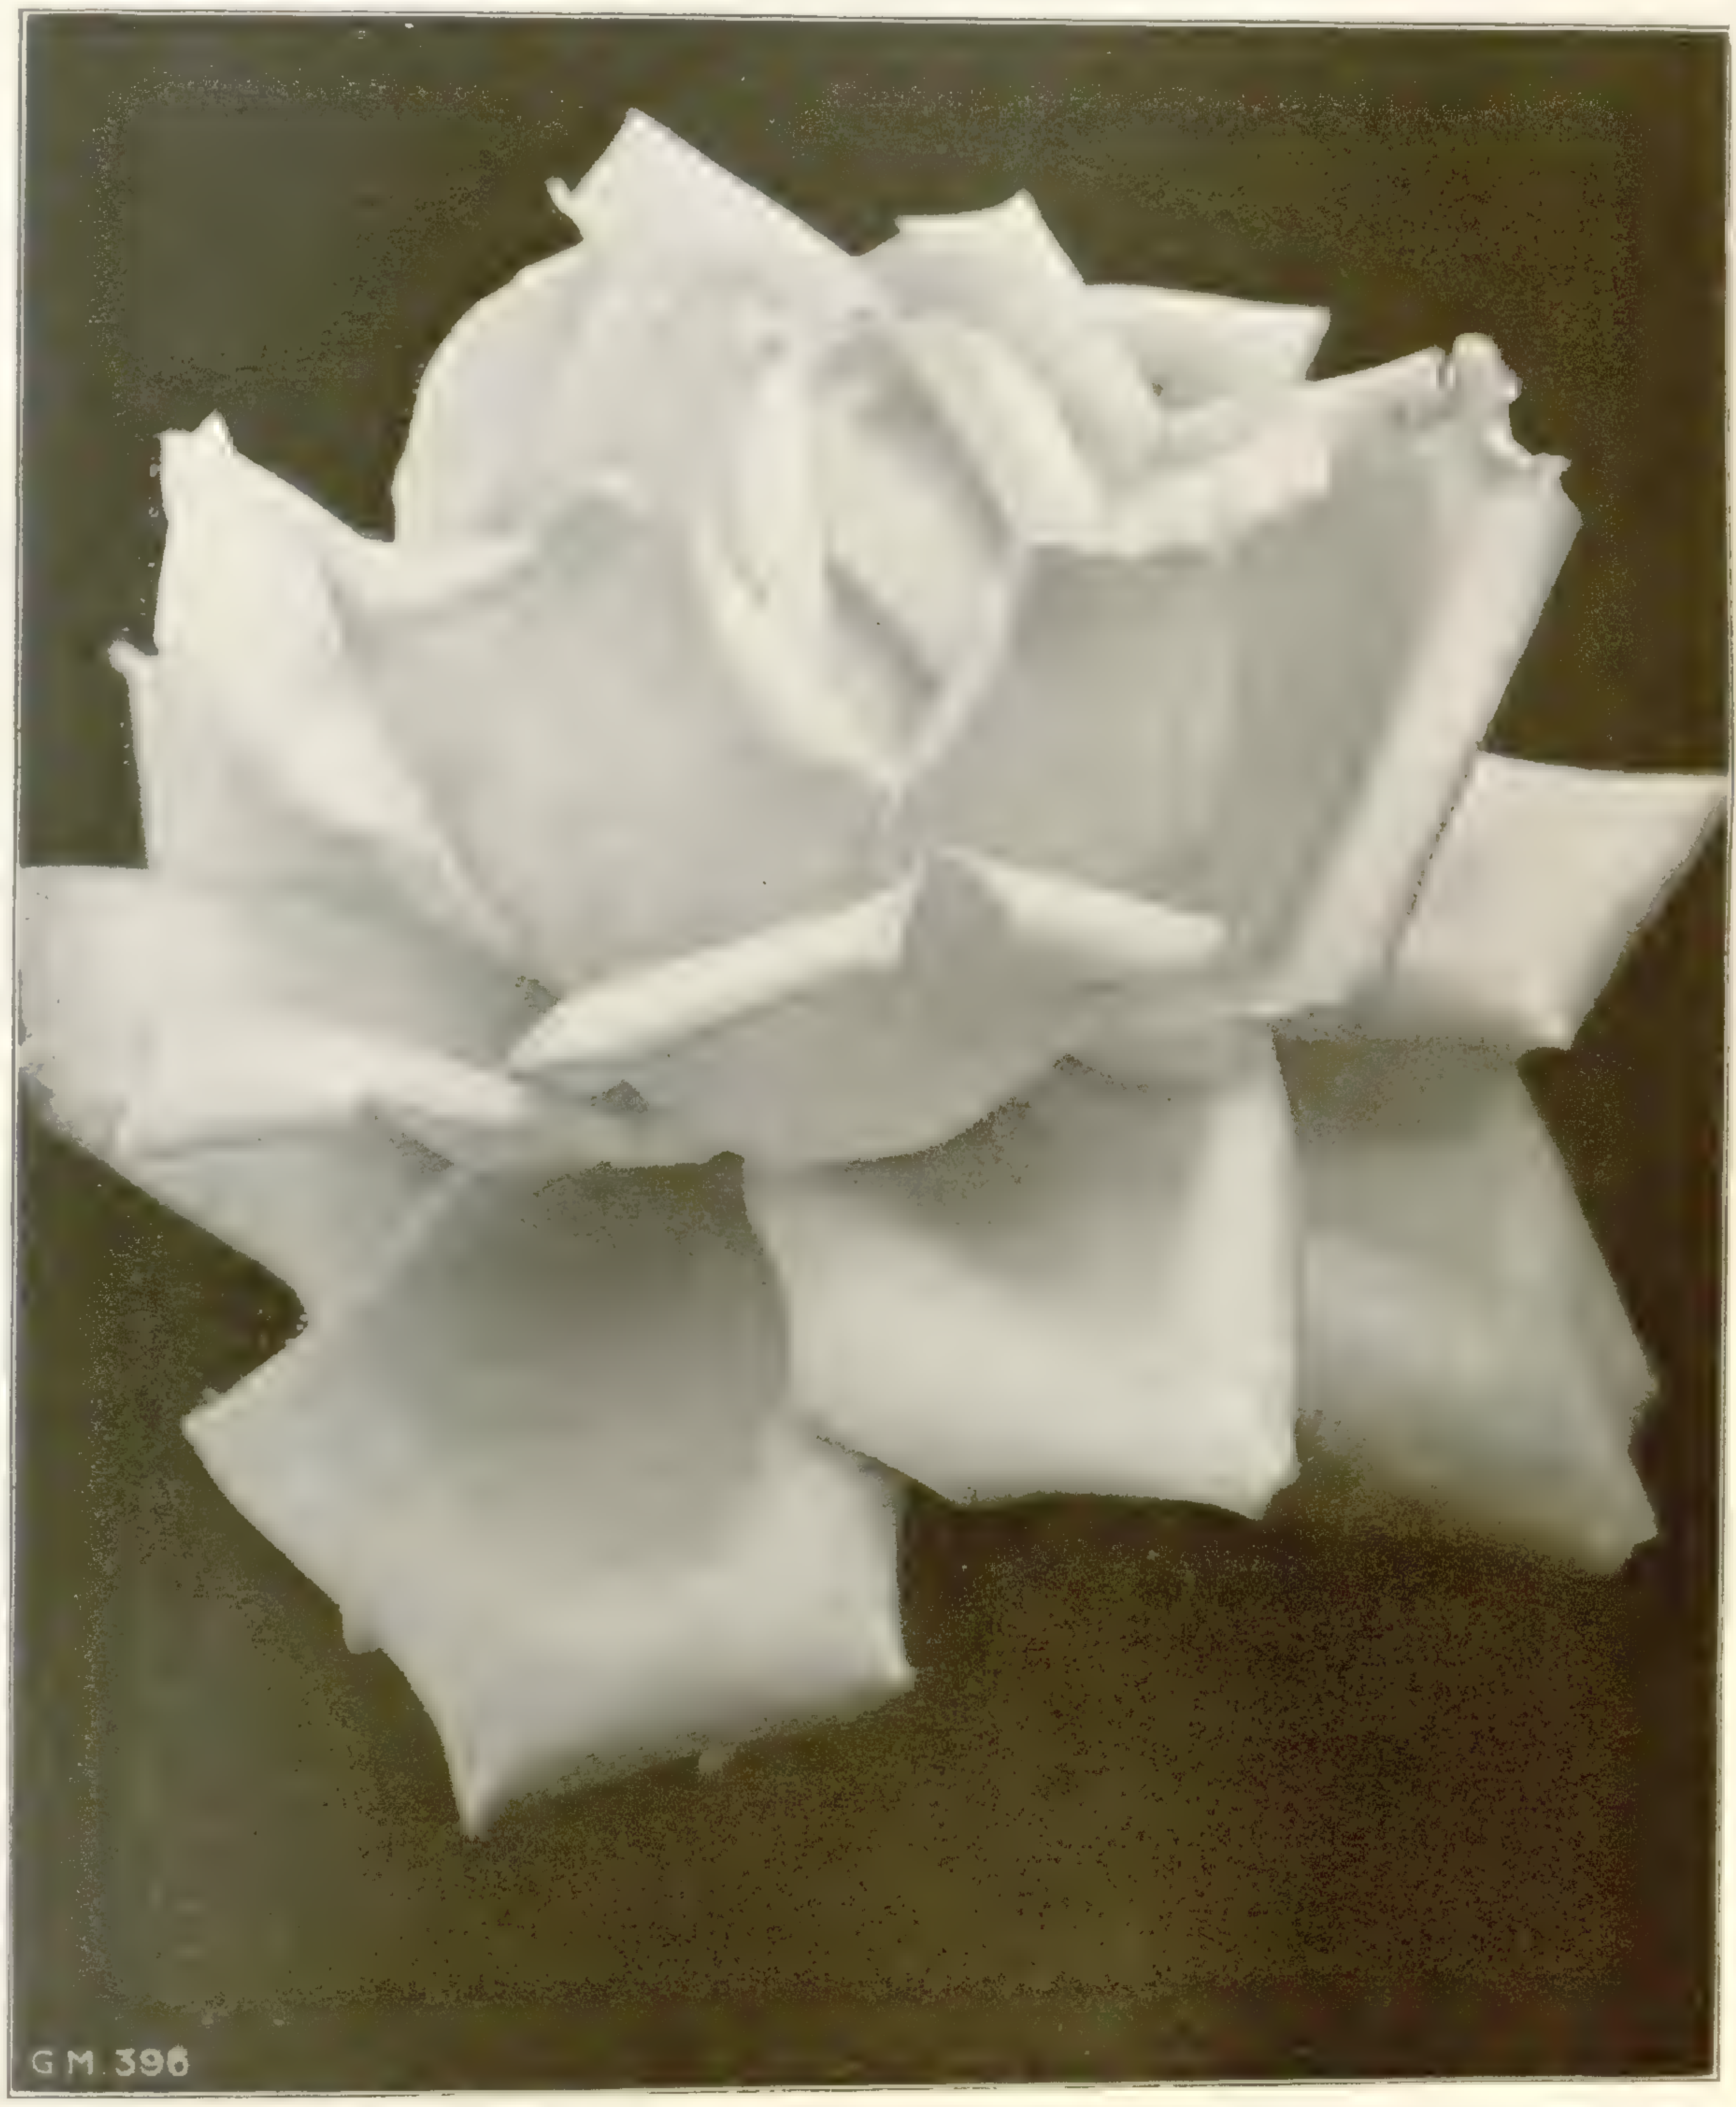
BEGONIA GLOIRE DE SCEAUX.—This variety should be cultivated in the stove and shaded during bright sunshine. Keep a sharp watch for thrips, which sadly disfigure the plants by feeding on the under sides of the leaves. In order to preserve the beauty of the foliage the plants should not be damped overhead, yet the syringe must be freely used between the pots below the leaves. When grown to a large size this begonia is very effective in decorations. It is necessary to start early in the season to secure strong plants, and these have to be repeatedly potted when the state of the roots show this to be necessary. When strongly grown, lateral growths are freely made, which makes the specimens assume a pyramidal form. Should these growths not be forming pinch out the points of the leading shoots to induce branching growth.

BEGONIA GLOIRE DE LORRAINE. — The difference between this begonia and the preceding one is very marked. In this case five-inch pots, and even smaller, will suffice for fine specimens when given close attention. The flowers should not be allowed to remain upon plants that are not developed to the desired size, nor on those required for autumn display.

MANETTIA BICOLOR.—This should be grown in a warm, moist house near to the glass, and, in order to keep it clean make free and frequent use of the syringe. Loam, peat and sand, three-parts of the former to one of peat and some sand, make up a good compost. If the plants have been raised from cuttings, 4in. pots will be about the size they now occupy; shift into 6in. pots before the plants get pot-bound. A trellis will be necessary to accommodate the growths by the time the plants are in full flower.

CLERODENDRON FALLAX.—This will now have filled its pots with roots, and must be liberally supplied with some form of stimulant, as it is a gross feeder.

CLERODENDRON THOMSONÆ. — This species will be making rapid growth, and a good plan is to train the shoots up strings, in which position they ripen much better, and can be easily taken down and trained to any required shape; if not repotted recently, top-dress with good loam, peat, and a little artificial manure. — W. Fyfe, Lockinge Gardens.



NEW H.T. ROSE, GRACE MOLYNEUX.

A beautiful hybrid tea, exhibited by the raisers, Messrs. Alex. Dickson and Sons, at the Holland Park Show, July 6 and 7, when it received an Award of Merit. The blooms are of large size, and the colouring cream-white, tinted rose.

FRUITS UNDER GLASS.

EARLY VINES. — When the grapes have been cut the structure should have a thorough cleansing, more especially if the vines have been infested with insect pests. In a properly-managed house they should not have been so attacked, except where other plants are grown in these houses. If any mealy bug has become located in the vinery, as soon as the fruit has been all cleared give the vines a thorough washing with a garden engine fitted with a strong force pump. A good liquid to use is one prepared as follows: To every gallon of warm water add one small wine glass of petroleum and a little sulphur. Thoroughly mix, and then syringe with force every part of the house. Another man or lad should work a syringe into the mixture during the spraying so as to keep the oil and water well mixed. Those inexperienced will find it best to use a proprietary article, such as petroleum emulsion. If this washing is given once every week throughout the season, and the vines well syringed with clear water every day, the pest, whatever it may be, will soon be reduced to a minimum, and in a short time, with skill and perseverance, be effectually eradicated.

SUCCESSION VINERIES.—Look over all the bunches, and see that the berries are not pressing each other. If this is so, a few berries must of necessity be taken out. This should be done skilfully, so that the right berry is removed, as a wrong berry taken out at this time may spoil the symmetry of the bunch. Carefully pinch off the laterals as often as may be necessary, and see that the borders are in a nice moist condition. As soon as the berries have completed the stoning process give a good dressing of some approved manure.

MELONS.—The last batch of these should now be planted in the position in which they are to fruit. The plants should be freely syringed on fine afternoons, and the flowers be pollinated about 11.30 a.m., as at this time the pollen will be quite dry. Do not leave sufficient fruits on the vines to unduly tax them, and as soon as they commence to swell give a little manure to stimulate development, as these fruits require pushing for the first two or three weeks. Melons can be grown excellently in frames at this season, and these fruits are very useful in August and September for despatching to Scotland and elsewhere. They are usually much appreciated, and no fruits pack much easier than these.

FRUIT TREES IN POTS. — When the fruits have all been gathered the trees may be placed in a sunny position outside, taking care that they do not become dry; at least, not dry enough to cause flagging of the foliage, as this would seriously affect their well-being for another season. They should have a good washing occasionally with the garden engine during periods of dry weather. Trees in cool houses must receive special care in watering, more especially in dull, cloudy weather. A supply of soot water occasionally helps the colouring of the foliage, whilst trees bearing good crops should have some diluted cow manure alternately with some approved artificial fertiliser. Syringe the foliage on bright mornings, and at closing time or about four p.m. Keep all lateral growths properly stopped so that the trees may be kept in shape. It is quite possible to make a good shaped tree out of one that has become unshapely, with careful manipulation of the shoots during the growing season.

TOMATOES.—It will be necessary during the next week or two to sow some tomato seed to furnish plants for producing supplies during the autumn and early winter months. Sow thinly, and grow the plants quite in the open. Duke of York and Sunrise are both excellent for the purpose. Tomato plants now cropping should receive a supply of liquid manure weekly, and all the side growths or laterals kept pinched off.—W. A. Cook, Leonardslee Gardens, Horsham.

THE KITCHEN GARDEN.

CAULIFLOWERS.—The early plants will be producing their heads rapidly now. Do not allow the heads to be exposed, but cover them with leaves or brown paper to retain their purity. To extend the supply over as long a period as possible, a number of them may be lifted with their roots and laid in under a north wall or hedge, or in some other cool position. Keep them moist at the roots with an occasional watering. The successional plantings will be improved by giving them applications of liquid manure about once a week during their early growth.

SHALLOTS will be ripening off their growth, and when it is completed have the bulbs pulled up and placed in a position where they will gradually dry, such as an airy shed, to be in readiness for storing later on.

GLOBE ARTICHOKES.—In many places these are considered one of the choicest dishes, and it is necessary that the heads should be fleshy and well fed to be satisfactory. To accomplish this the stems should be disbudded, leaving only the centre head and the growth thinned out to only the strongest shoots to stand at a fair distance apart, and be able to enjoy exposure to light and air. On sandy soils a mulching of manure will be found beneficial, with supplies of liquid manure-water at short intervals.

SPRING CABBAGE.—A small sowing of seed may be made during the next week or so. The plants from this sowing will be found useful for planting at about a foot apart on a south border for the first cutting. Early plants are prone to running to seed, especially some varieties. After repeated trials with many cabbages, I still consider Ellam's Early the most reliable and less subject to bolting for the early crop. Choose a well-tilled piece of ground for sowing, and apply a dusting of soot and lime to the surface, working it in with the rake. If the weather is dry watering the drills may be necessary before placing the seed.

RUNNER BEANS. — The plants will be making headway, and will require ample moisture at the roots to enable the plants to set their pods perfectly. In most cases a mulching on each side of the rows will assist them, as will a weekly watering of liquid manure. Gather the pods regularly to avoid allowing many large pods remaining unnecessarily at one time.

AUTUMN-SOWN ONIONS.—These will be bulbing at a rapid rate now. Carefully bend over the top growth at the neck, and if the bulbs are required for special purposes the plants may be given artificial manure of suitable kind, which should be watered in. Remove all weeds and keep the surface soil loose by frequent stirrings.

EARLY BRUSSELS SPROUTS AND BROCCOLI will be nicely established. Work the fork lightly amongst the plants, and slightly mound the stems with the soil to enable them to better resist the winds. In doing this remove any defective plants and replace with others.

GENERAL REMARKS. — Early rhubarb crowns may possibly be throwing up seed stems; if so, cut the stems away and manure the plants. Pull up spinach as soon as it goes to seed; if not too far advanced, it may be dug in when preparing the ground for further crops. The season so far has been convenient for killing weeds before they reach the seeding stage, which is of immense value in not only saving labour of this season, but also that to come. This being a most active growing part of the season, continue to keep them as far as possible from making headway and casting seed.—Charles Flack, Cholomondeley Castle Gardens.

Halesia hispida.—The "Snowdrop or Silver-bell" tree is a familiar object in many gardens, for large examples are met with fairly frequently. The species under notice is not, however, so well known, and good specimens are rarely seen. It differs considerably from the common species, both in foliage and flowers, and has been called by another generic name, i.e., pterostyrax. It is a native of both China and Japan, and forms a large, spreading bush, or small tree. The leaves are oval, six inches or more long, and three inches wide, with small, regular teeth along the margin. The flowers are borne at the end of June and early in July in large pendulous panicles, and are white in colour. The petals are narrow, and the stamens prominent, the combination of the two giving the flower a fringed appearance. It thrives well in light loamy soil, and should have a place on a lawn or in some other position where it may be seen from all sides. It is not the best of subjects for a shrubbery.—W. D.

TREE PÆONIES IN POTS.

Where the tree pæonies succeed in the open they produce a gorgeous display when in bloom, but, unfortunately, it is not in every locality where they succeed. The main factor to success is a warm, sandy loam or peaty soil, which is so much warmer in spring. Where the soil is of an opposite character—cold, heavy, and retentive of moisture—it is difficult to induce the plants to exist. Certainly they give, under such conditions, a poor idea of their great beauty, as seen under more favourable conditions.

Where a cool greenhouse, peach house, or any cool glass structure is available, tree pæonies may be successfully grown, as they will revel and well repay the attention bestowed upon them by their rich display of colour in May. Even where the soil is quite suitable for their growth the air frost too often spoils the season's display by injuring the young growth, and thus checking the development of the flower buds. The glass protection then renders the plants free from this danger. Early in the autumn is a good time to pot up the plants ready for next season's display, and the following varieties will provide a suitable selection.

Double.—Alba lilacina, white, with lilac tips. Van Houttei, bright carmine. La Ville de St. Denis, delicate pink, centre tinted carmine. Leopold, rich rose-violet. Louise Mouchelet, flesh pink. Madame Laffay, rose-violet. Odorata rosina, satin white. Eliarsi rosea, maroon. Grand Duc de Bade, violet-rose. Lactea, pure white. Imperatrice Josephine, rich rose-lilac.

Single-flowered. — William Tell, pure white. Versicolor, deep purple, shaded violet. Samarang, vermilion, dark spots. Rose Chere, brilliant satin pink. Reine Amelia, rose-carmine, tipped violet. Purpurea, deep violet-purple. Professeur de Savoye, bright salmon-orange. Prince de Wagram, bright flesh. Madoni, rose-lilac, crimson centre. Baron D'Ales, fine rose-salmon. Blanche Noisette, blush white. Capitaine Champion, cream-white, centre stamens sprinkled with gold. S. H.

STYRAX JAPONICA.

The two or three species of styrax in general cultivation are all ornamental plants and worthy of inclusion in the most select collections. S. japonica forms a large, spreading shrub 15 to 20 feet high eventually, but is more frequently met with about half that height. The leaves are small and ovate, with serrate margins, the flowers white, in axillary, pendulous racemes. The racemes are very loose in appearance and composed of about half-a-dozen flowers each. As they are borne freely, a good-sized bush covered with flowers presents a very attractive appearance. Such specimens are occasionally met with. A very fine one has long been famous in Messrs. Veitch's Nursery at Coombe Wood, whilst a nice example, 16 to 18 feet high, may be seen in Lord Clinton's garden at Stevenstone, N. Devon. Like the other styraxes this is very impatient of root disturbance, and the transplanting of a large example must be done with great care. When first planting it a position should be selected which is likely to be a permanent one, and the plant should, if possible, be planted from a pot. Though it thrives in loamy soil it appreciates a little peat, and it is a good plan to place a little about the roots at the time of planting. Although originally described as a Japanese plant it is found in China also.
W. D

GREAT FLOWER SHOW AT HOLLAND PARK.

(Concluded from page 528.)

had beautiful displays of liliums, spiræas, Dorothy Perkins, and rambler roses, and a glorious lot of perpetual carnations set up in great stands and vases—a splendid exhibit.

Very beautiful were the roses from Messrs. Alex. Dickson and Sons, Newtownards, Ireland, and they were almost entirely new varieties of their raising, and included Grace Molyneux (A.M.), May Countess of Ilchester, Mrs. Arthur Munt, Mrs. David Jardine, Nita Weldon, Walter Speed (A.M.), Duchess of Wellington, soft yellow (A.M.), Harry Kirk, J. Cuff, G. C. Waud, and Elizabeth Barnes. Mr. S. Mortimer, Farnham, was an extensive exhibitor of sweet peas, and Messrs. Merryweather and Sons, Southwell, Notts, staged a group of roses, in which their bright red polyantha variety named Jessie was a great attraction. Messrs. G. Bunyard and Co., Maidstone, had a fine bank of hardy flowers, and contained grand lots of popular things. Mr. Chas. Turner, Slough, sent King of Delphiniums, a lovely blue and white variety. Mr. A. L. Gwillim, Eltham, put up a group of his finely-selected double tuberous begonias.

The hardy flowers from Messrs. T. S. Ware, Ltd., Feltham, made a brave display, but these were put in the shade by the grand lot of begonias staged by this firm; these, as usual, were finely grown, and Mrs. A. P. Brandt, pink; Thos. Rooney, white; Duchess of Connaught, salmon; and Patrick Ainslie, scarlet, were very attractive. Messrs. H. B. May and Sons, Edmonton, brought up a collection of choice varieties of hardy ferns, and a selection of zonal pelargoniums. Mr. Usher, gardener to Sir Randolf Baker, Bart., Ranston, Blandford, showed a grand lot of sweet peas, staging great sheaves of Mrs. A. Ireland, Mrs. Hardcastle Sykes, Clara Curtis, The King, The Marquis, Evelyn Hemus, Sunrise, Lavender George Herbert, etc. Mr. C. W. Breadmore, Winchester, was another very large exhibitor of sweet peas, his big group including beautiful blooms of Dazzler, Constance Oliver, George Herbert, Helen Lewis, Princess Juliana, Kathleen MacGowan, Marjorie Willis, Henry Eckford, Mrs. Collier, and Mrs. A. Ireland. Messrs. Jas. Veitch and Sons, Chelsea, had a charming lot of standard fuchsias, a goodly group of carnations, and splendid gloxinias. Splendid carnations of the perpetual class were staged in quantity by Messrs. Bell and Sheldon, Guernsey. Roses, chiefly decorative varieties, made up a good exhibit from Mr. Chas. Turner, Slough, who also had a display of carnations.

Popular garden roses were submitted by the King's Acre Nursery Company, Hereford. Messrs. Jarman and Co., Chard, had a bright lot of sweet peas, the variety Mrs. Townsend (A.M.) being very largely shown; this has a light blue flaking on the standard that is very pretty. Messrs. Blackmore and Langdon showed a beautiful lot of their exquisite frilled single begonias in various colours, and a grand lot of their splendid double varieties, of fine form, lovely colours, and great size—Duchess of Cornwall, big and very rich deep crimson, was a stately variety, and Mrs. Lockwood was equally fine. One of the finest displays of carnations was that put up in the orchid tent by Mr. C. F. Waters, Balcombe, Sussex, which included perpetual, Malmaison, and border varieties, and showed them all in goodly numbers associated with Asparagus Sprengeri; Helen Countess of Ilchester, Daffodil, and Britannia were very fine.

Messrs. W. Cutbush and Son, Highgate, presented a very pleasing group of roses, pink spiræas, Malmaison and perpetual carnations, and the bright Coleus Cordelia in the big tent. Mr. F. Bright, gardener to J. Friedlander, Esq., Reading, showed half-a-dozen giant pyramidal fuchsias, single varieties, clothed from base to summit with graceful flowers. Messrs. H. B. May and Sons, Edmonton, had a very big group of choice ferns, such as nephrolepis, gymnogrammas, polypodiums, asplenium, platycerium, etc., and every plant in a fine, well-arranged exhibit, was perfectly grown. The group of fine foliage plants submitted by Messrs. James Veitch and Sons, Chelsea, was a good feature, and here the fine cultivation evidenced was as greatly admired as the selection of subjects. Crotons, anthuriums, dieffenbachias, bertolonias, aralias, nepenthes were prominent plants, and with these were a few cannas and orchids.

NEPHROLEPIS MAGNIFICA.

A remarkably beautiful nephrolepis with finely-cut and elegant fronds, exhibited by Messrs. Stuart Low and Co. at the Holland Park Show, July 6 and 7, when it received an Award of Merit.

Messrs. W. Paul and Son, Waltham Cross, filled one corner of the big tent with a glorious exhibit of roses. They had a groundwork of cut flowers, set in vases and baskets, and these were largely of varieties of their own raising; over these rose pillars and standards of Fairy, Helene, Tausendschon, Hiawatha, and Leuchtstern. Messrs. G. Jackman and Son, Woking, were extensive exhibitors of roses and hardy border flowers. Mr. H. J. Jones, Ryecroft Nursery, Lewisham, set up good sweet peas in great variety.

A charming group of sweet peas was set up by Messrs. Sutton and Sons, Reading, who made a great display of The Queen, Helen Lewis, Clara Curtis, Mrs. C. W. Breadmore, The Marquis, Prince Olaf, John Ingman, Helen Pierce, and a great array of seedlings from The Queen, all beautiful. Messrs. E. W. King and Co., Coggeshall, were represented by a very fine exhibit of splendid sweet peas, putting up fine bunches and half a dozen arches of flowers. Conspicuous varieties were Enchantress, Helen Lewis, Elsie Herbert, St. George, Mrs. William King, Anglian Blue, Miss L. E. King, Constance Oliver, and several good seedlings.

OUTSIDE EXHIBITS.

Messrs. J. Cheal and Sons, Crawley, had a big display of ornamental trees and shrubs outside the tents, the tree ivies being conspicuously good. Messrs. David Russell and Son, Brentwood, also had a big exhibit of hardy ornamental and flowering shrubs out of doors, and Messrs. Cutbush and Son, Highgate, had a large display of clipped trees and shrubs. Messrs. Fromow and Sons, Chiswick, contributed maples and other hardy shrubs of ornamental character outside one of the tents.

Messrs. James Carter and Co., Holborn, arranged a very tateful display out of doors, once more taking as their design a Japanese garden, with its dwarf trees, rockwork, water lilies, and choice hardy flowers. The arrangement was excellent, but the weather prevented many from inspecting it. Messrs. John Waterer and Sons, Bagshot, contributed a bold group of ornamental shrubs, rhododendrons, kalmias, etc. Mr. L. R. Russell, Richmond, had a pool of water lilies surrounded by bamboos, and hardy ornamental-leaved and flowering shrubs.

Mr. J. Forbes, Hawick, had some fine phloxes and pentstemons and violas arranged out of doors, and among the latter we made special note of Emile Rodigas, Sir Dighton Probyn, Crimson Gem, Phryne, Lady Forbes, Dr. E. Behring, A. J. Allsop, Galatea, and Edwin Beckett.

ORCHID COMMITTEE.

A grant exhibit of orchids beautifully arranged by Messrs. Charlesworth and Co., Hayward's Heath, included fine lælio-cattleyas, batches of Epidendrum vitellinum majus, Miltonia Bleuana grandiflora, Ærides Houlletiana, Odontioda Bradshawæ, the new Miltonioda Harwoodi (Cochlioda Noetzliana, and Miltonia vexillaria), Odontioda Charlesworthi, Vanda cærulea, Cymbidium tigrinum, L.-c. Aphrodite magnifica, and a group of very quaint orchids of botanical interest.

Charmingly arranged was the display of orchids from Messrs. Sander and Sons, St. Albans, who had bold, tall pyramids of miltonias, lælio-cattleyas, odontoglossums, phalænopsis, etc., the latter being unusually fine. Lælio-cattleya Martinetti The Prince (F.C.C.), was a feature of this very fine display. Messrs. Stuart Low and Co., Bush Hill Park, Enfield, had a bright group of orchids, cattleyas, miltonias, oncidiums, Epidendrum vitellinum majus, Odontoglossum armainvilliersense, and Cymbidium Lowianum being the principal contents.

Mr. Balmforth, gardener to F. Mentieth Ogilvie, Esq., The Shrubbery, Oxford, had here as fine a lot of orchids as at the Temple Show, setting up grand lots of Miltonia vexillaria, Odontoglossum crispum, O. Harryanum, Cypripedium callosum Sanderæ, Miltonia vexillaria Chelsiensis, Phalænopsis, thunias, lælio-cattleyas, etc., and a fine spike of Odontioda Bradshawiæ with twenty-five flowers.

Messrs. Moore, Lim., Rawdon, Leeds, contributed a beautiful exhibit of orchids, their selection of brightly-blotched odontoglossums showing up well among excellent lælio-cattleyas, cattleyas, cypripediums, and phalænopsis. Mr. Edward V. Low, Vale Bridge, Haywards Heath, sent a small group of choice orchids that included white varieties of Cattleya Mossiæ, Odontioda Goodsoniæ, and Cœlogyne pandurata. Miss W. Walters Anson, Dovedale, Streatham, brought forward a fine series of orchid pictures, beautifully executed in water colours.

FRUIT AND VEGETABLE COMMITTEE.

Mr. T. Coomber, gardener to Lord Llangattock, The Hendre. Monmouth, exhibited twenty splendid fruits of The Queen pineapple, and magnificent fruits of Royal Sovereign, The Leader, The Laxton, The Alake, Trafalgar, Cropper, Gunton Park, Sir Chas. Napier, Bedford Champion, Reward, Sir Joseph Paxton, the pale Louis Gauthier, The Bedford, and Fillbasket strawberries. Mr. Wm. Poupart, Fernleigh Orchards, Twickenham, showed a large set of splendid bottled fruits, representing a great number of kinds, all in glass-stoppered bottles.

A large and very attractive exhibit of strawberries came from Messrs. Laxton Brothers, Bedford, and many covetous eyes looked over them. The varieties shown in quantity were Royal Sovereign, Fillbasket, Reward, Leader, Cropper, Mentmore, Sir Joseph Paxton, The Bedford, Profit, Pineapple, Bedford Champion, and Rival. A collection of melons, grapes, peaches, etc., came from the Horticultural College, Swanley.

Cherry trees in pots, heavily laden with splendid ripe fruits, made up a very attractive exhibit from Messrs. Bunyard and Co., Maidstone; the variety Ludwig's Bigarreau was very fine in size of berry and crop. The same firm staged a set of strawberries. Mr. Camp, gardener to S. Heilbut, Esq., Holyport, Maidenhead, brought up a lot of splendidly-grown and finely-fruited pot trees of cherries, figs, peaches, and nectarines.

A magnificent collection of vegetables set up in splendid style by Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, was greatly admired; indeed, rarely have vegetables been so attractively shown, even by Mr. Beckett. He had beautiful heads of First Crop, Magnum Bonum, and White Queen cauliflowers, and fine dishes of Early Giant, Centenary, Superlative, and Duke of Albany peas, The Sutton marrows, Intermediate, Early Gem, and Scarlet Horn carrots, Sunbeam, Winter Beauty, and Perfection tomatoes, Duke of York, Herd Laddie, and King Edward potatoes, seakale, beet, Solid White celery, turnips, lettuces, artichokes, cucumbers, French beans, radishes, and egg plants.

Messrs. Sutton and Sons, Reading, displayed a collection of over forty varieties of culinary peas of the first early class, and some of those that attracted special attention were Early Giant, May Queen, Ideal, Pioneer, Duchess of York, World's Record, King of the Dwarfs, Centenary Marrowfat (very fine), Ideal, and Reading Wonder.

HORTICULTURAL SUNDRIES.

The horticultural sundries department grows with each successive year, and on this occasion very many new and attractive articles constructed for the purpose of lightening the labours of the gardener were placed on exhibition by specialists in their several directions. Messrs. Wm. Wood and Sons, Lim., Wood Green, showed an immense variety of patent appliances, plant foods, and insecticides. Indeed, a fitting sign for this extensive and really interesting display would have been "Everything necessary for use in the garden."

The Alpha Fire Extinguisher, Lim., Ross, Herefordshire, showed their well-devised sprayers in various sizes and patterns. Their horizontal knapsack is certainly a good one. Messrs. James Hill and Co., Lim., 100a, Queen Victoria Street, E.C., showed tools, preserving bottles, thermometers, etc. Messrs. C. Toope and Son, Stepney, E., showed their well-known heating apparatus, and portable propagators. Beehives, fruit preserving bottles, and the Osterley table trays were exhibited by Messrs. Abbott Brothers, Southall. Boilers and heating apparatus came from Messrs. Chas. P. Kinnell and Co.,Southwark Street, S.E. Messrs. Blake and McKenzie, Lim., Liverpool, showed paper travelling pots, floral albums, seed measures, and an ingenious contrivance for counting sweet pea seeds.

Messrs. Cooper and Nephews, Berkhamsted, put up samples of their spraying fluids and weed killers. Apterite for killing ground vermin was also exhibited. The "Besnard" sprayers were shown by Messrs. Darcy and Co., 15, Seething Lane, E.C. Mr. W. J. Robertson, Cowleigh Road, Malvern, had samples of "Nitrolin" and "Bruin" fertilisers, the former being a new thing in plant foods. Messrs. Corry and Co., Lim., Shad Thames, S.E., made a display of their well-known specialities. The improved Lethorion cone, and the firm's special winter wash were new articles on this stand. Messrs. Walter Voss and Co., Lim., Millwall, E., showed a variety of chemical preparations, including a new remedy for cucumber spot called the Carlton spot fumigant. The Carlton sweet pea manure was shown, and also specimen blooms grown by its aid.

Acme labels were shown by Mr. John Pinches, 3, Crown Buildings, Crown Street, Camberwell, S.E., who also had a good rose box, its distinctive feature being an easily detachable hinge. Messrs. D. Dowel and Son, Ravenscourt Avenue, Hammersmith, W., showed a variety of pots and vases for plants, bulbs, and cut flowers. Messrs. Wakeley Bros., Bankside, S.E., showed their well-known hop manure. Models of greenhouses and boilers were staged by Messrs. J. Weeks and Co., Chelsea. Messrs. T. J. Syer and Co., London, showed tools. Messrs. De Luzy Frères, Camberwell, S.E., showed sprayees, sulphur bellows, etc. French cloches were exhibited by Messrs. W. E. Chance and Co., Halesowen Street, Oldbury. Messrs. W. Dietz and Co., Crown Court, Pall Mall, S.W., showed some excellent cigarettes, named The Albemarle, probably interesting to a good many gardeners, although scarcely within the term "Garden sundries."

The Palace Condiments, prepared from recipes of the King's chef, were shown by Messrs. Gillard and Co., Walthamstow. Messrs. Michael Rains and Co., Holborn, W.C., showed specially adapted fountain pens for garden use. Microscopes and seed testers were also to be seen on this stand. Messrs. W. Herbert and Co., Hop Exchange, S.E., had a varied display of garden requisites. Mr. M. Johnston, New Park, Cranleigh, Guildford, showed some excellent samples of fibrous loam. Tubs for shrubs were shown by Mr. T. J. Elwin, 22, Weaver Street, Spitalfields, E. The Gardeners' Magazine occupied a stand in one of the long tents, on which were displayed various books on horticultural subjects, specimen illustrations of flowers and plants, etc. The Colorado Orchard Heater Company, Hounslow, showed their special apparatus for fighting the frost in orchards. The Pattisson Horse boots were displayed by Messrs. H. Pattisson and Co., Greyhound Lane, Streatham. Mr. R. B. Hayward, 22, Addle Street, London, E.C., had on view garden order books, note books, and sleeve protectors, which are designed to save the sleeves of gardeners. A variety of baskets were shown by the Meath Home of Comfort for Epileptic Women and Girls, Godalming.

The French Cloche Company, Caxton House, Westminster, put before visitors the cloches, crates, etc., as used in the pursuit of French gardening. Messrs. R. Jackson and Co., 171-2, Piccadilly, W., displayed glass ware of useful and ornamental design, also bottled fruits in patent bottles. Messrs. Pradal Irénée and Co., 27, Castle Street, London, W., showed excellent wire-bound tubs for trees and shrubs. Mr. F. Hickson, 23, South Hill Park, Hampstead, N.W., contributed his brass-wire flower displayers, and also pulp-ware bowls. Outside the tents were grouped various exhibits of horticultural buildings, garden furniture, and machinery. Here again Messrs. William Wood and Sons, Lim., were extensive exhibitors. The Castle Ship-breaking Co., Lim., Baltic Wharf, Millbank, Westminster, exhibited their artistically designed, and well-made teak-wood garden seats.

Messrs. Jas. Crispin and Sons, Bristol, brought a nice little greenhouse, some useful frames, and seed protectors. Shanks's lawn mowers in various sizes were on view, as also were those made by Messrs. T. Green and Sons, Lim., Leeds. The motor-driven machines are very compactly made, and serviceable-looking.

Messrs. C. and W. Buswell, Victoria Works, Torquay, put up a number of small garden tents, the "Luxuriant" hammocks, and garden seats. A feature of the tents exhibited was that no centre-pole was used, and no rope supports. The whole construction is neat and very economical of space. A neat little tent table with folding flaps attracted our attention. A remarkably good frame was exhibited by Messrs. Storrie and Storrie, Glencarse, Perthshire. The design is the firm's own, and the outstanding feature is a hooped device, by means of which the lights may be fixed at any desired angle, admitting air, but excluding both wind and rain. Drip is prevented by using single sheets of glass, and the construction of a centre gutter for carrying off the water. The Patent Safety Ladder Company, Peterborough, exhibited adjustable ladders of very useful make. Messrs. J. Carter and Co., High Holborn, made a most effective display of garden vases, designed to combine artistic beauty and serviceability, particularly in regard to the requirements of the plants to be grown in them. Sundials were included in this effective exhibit. Ornamental pottery was also shown by Messrs. Jas. Stiff and Sons, Lambeth, S.E. Messrs. G. B. Kent and Sons, Lim., 75, Farringdon Road, E.C., showed brushes and brooms.

Well-designed trelliswork, rose supports, and garden seats were shown by Messrs. W. Walters and Co., Water Lane, E.C. Mr. A. C. Harris, Leicester, exhibited a patent rose-gatherer, called the "Gripper garden walking stick." Messrs. Pearce and Co., Holloway Road, London, showed a small, well-built greenhouse. Mr. G. W. Riley, Herne Hill, S.E., displayed rustic buildings, arbours, and arches in great variety. A well-constructed summer-house with thatched roof was prominent among the examples here shown.

Mr. Alex. Hamilton, 11, Conduit Street, W., contributed some good tables and seats made of teak wood. The designs were good. Well-made tubs for shrubs were included in the exhibit. The well-known lawn mowers from Messrs. Ransomes, Sims, and Jeffries, Lim., Ipswich, were on view, hand, horse, and motor machines being represented. Messrs. H. Scott and Sons, Woodside, S.E., displayed rustic work, tools, and packing cases. Greenhouses, pits, and forcing houses were shown by Messrs. Wm. Duncan Tucker and Sons, Lim., Tottenham. The "Caloricult" forcing-house, for intensive culture, was exemplified by an erection of considerable merit. The Potters' Art Guild, Compton, Guildford, showed sculptural work and garden ornaments. A large display of artistic pottery was made by Messrs. Liberty and Co., Regent Street, W. The famous firm of Doulton and Co., Lim., Lambeth, S.W., showed beautiful vases, fountains, and statues. Messrs. Lloyd, Lawrence, and Co., 29, Worship Street, E.C., exhibited the Pennsylvania lawn mowers and sweeping machines. Seats and tables were shown by Messrs. T. J. Syer and Co., Wilson Street, E.C. Messrs. Inmans and Co., Royal Rustic Works, Stretford, Manchester, showed thatched summer houses and rustic seats. The Philadelphia Lawn Mower Company, Scrutton Street, E.C., showed their machines in various sizes.

MEDALS AND CUPS.

Gold Medals.—The Rt. Hon. Lord Llangattock (gardener, Mr. Coomber), for pineapples and strawberries; Hon. Vicary Gibbs (gardener, Mr. E. Beckett), for vegetables;

F. Menteith Ogilvie, Esq., for orchids; Messrs. G. Bunyard and Co., Maidstone, for fruit trees in pots; Messrs. J. Carter and Co., Holborn, for Japanese garden; Messrs. Charlesworth and Co., Haywards Heath, for orchids; Messrs. W. Cutbush and Son, Highgate, N., for flowering and herbaceous plants; Messrs. H. B. May and Sons, Upper Edmonton, for exotic ferns; Messrs. W. Paul and Son, Waltham Cross, for roses; Messrs. Amos Perry, Enfield, for rock and water garden; Messrs. M. Prichard, Christchurch Hants, for herbaceous plants; Messrs. Sander and Sons, St. Albans, for orchids; Messrs. Sutton and Sons, Reading, for sweet peas and culinary peas; Messrs. J. Veitch and Sons, Chelsea, for foliage plants, and one also for gloxinias, flowering plants, etc.; Messrs. R. Wallace and Co., Colchester, for formal water garden and herbaceous border.

Silver Cups.—Sir Jeremiah Colman (gardener, Mr. J. Collier), for orchids; Sir Randolph Baker (gardener, Mr. A. E. Usher), for sweet peas; J. Friedlander, Esq. (gardener, Mr. F. Bright), for fuchsias; S. Heilbut, Esq., Maidenhead, for cherries in pots; Messrs. W. Artindale and Son, Sheffield, for herbaceous plants and violas; Messrs. Barr and Sons, Covent Garden, for herbaceous plants and Japanese trees; Messrs. Blackmore and Langdon, Bath, for begonias and delphiniums; Messrs. G. and A. Clark, Dover, for herbaceous and flowering plants; Messrs. W. Fromow and Sons, Chiswick, for Japanese maples and shrubs; Messrs. Hobbies, Lim., Dereham, for roses; Messrs. E. W. King and Co., Coggeshall, Essex, for sweet peas; Messrs. H. B. May and Sons, Upper Edmonton, for hardy ferns; Messrs. Paul and Son, Cheshunt, for roses and pæonies; Mr. G. Reuthe, Keston, for alpines, herbaceous plants, etc.; Mr. L. R. Russell, Richmond, for ivies and foliage plants; Mr. R. C. Notcutt, Suffolk, for herbaceous plants, etc.; Messrs. S. Low and Co., Bush Hill Park, for orchids and flowering plants; Messrs. J. Veitch and Sons, Chelsea, for group in open air and carnations; Messrs. T. S. Ware, Lim., Feltham, for begonias and herbaceous plants; Messrs. E. Webb and Sons, Stourbridge, for sweet peas and vegetables; Lieut.-Colonel C. Heseltine, Lymington, Hants, for roses; Mr. A. J. Paskett, for sweet peas and carnations; and Mr. W. H. Page, Hampton, for carnation, etc.

Silver-gilt Flora Medal.—Miss M. W. Anson, Streatham, for orchid paintings. Messrs. G. Jackman and Son, Woking, for herbaceous plants. Messrs. W. Bull and Son, Chelsea, for foliage plants. Mr. C. Turner, Royal Nurseries, Slough, for roses and carnations. Messrs. J. Cheal and Son, Crawley, Sussex, trees, shrubs, and herbaceous plants. Messrs. Bell and Sheldon, Castle Nursery, Guernsey, for carnations. Mr. W. J. Unwin, Histon, Cambs, for sweet peas. Mr. C. W. Breadmore, 120, High Street, Winchester, for carnations. Messrs. H. Cannell and Sons, Swanley, for cannas and hybrid fuchsias. Messrs. J. Carter and Co., 97, High Holborn, W.C., for sweet peas, etc. Mr. F. Lilley, Guernsey, for gladioli. Messrs. F. Cant and Co., Braiswick Rose Gardens, Colchester, for roses. Mr. G. Lange, Hanworth Road, Hampton, Middlesex, carnations. Messrs. J. W. Moore, Lim., Rawdon, near Leeds, for orchids. Messrs. B. Ladhams and Son, Shirley, Southampton, for carnations. Messrs. Alex. Dickson and Sons, Lim., Newtownards, co. Down, for new roses. Mr. A. F. Dutton, Iver, Bucks, for carnations. Mr. C. F. Waters, Balcombe, Sussex, for carnations. Messrs. G. Bunyard and Co., Lim., Maidstone, for fruit trees, herbaceous plants. Messrs. A. Gwillim, Lim., Cambria Nursery, New Eltham, for begonias.

Silver Gilt Knightian Medal.—Messrs. Laxton Bros., Bedford, for strawberries. Mr. W. Poupart, Twickenham, for bottled fruits.

Silver Knightian.—The Swanley Horticultural College, for fruit and vegetables.

Silver Gilt Banksian Medal.—Messrs. Kelway and Sons, Langport, for sweet peas and hardy plants. Messrs. B. R. Cant and Sons, Colchester, for roses. Messrs. Carter Page and Co., London Wall, for sweet peas. Messrs. G. Prince, Oxford, for roses. Messrs. Stark and Son, Norfolk, for sweet peas. Miss Hemus, Upton-on-Severn, for sweet peas.

Silver Flora Medal.—Mr. W. A. Chaplin, Waltham Cross, for sweet peas and roses. Messrs. R. H. Bath, Lim., Wisbech, for carnation, roses, and delphiniums. Messrs. J. Forbes, Lim., Hawick, N.B., for phloxes, pentstemons, violas, and pansies. Mr. H. Hemsley, Crawley, for rock garden, hardy ferns. Messrs. J. Peed and Son, N. Norwood, S.E., for carnations and caladiums. The American Carnation Nursery, Sawbridgeworth, carnations. Messrs. Bees, Lim., Liverpool, for primulas and pot plants. The Guildford Hardy Plant Nursery, for hardy herbaceous plants. Messrs. Gunn and Son, Olton, Warwick, for herbaceous plants. King's Acre Nurseries, Lim., Hereford, for roses. Mr. C. Blick, Hayes, Kent, for carnations. Mr. E. V. Low, Haywards Heath, for orchids. John Rutherford, Esq., Blackburn, for orchids. Mr. Clarence Elliott, Stevenage, for alpines. Messrs. David Russell and Son, Brentwood, for hardy trees and shrubs.

Silver Banksian.—Mrs. Miller, Marlow, Bucks, for Moyleen orange jelly and chutney; Messrs. Merryweather and Sons, Southwell, for roses; Messrs. J. Waterer and Sons, Bagshot, for Kalmia latifolia; Messrs. J. K. King and Sons, Coggeshall, Essex, for sweet peas; Messrs. G. Mallett and Co., Cheddar, Somerset, for alpine flowering plants, etc.; Mr. W. J. Godfrey, Exmouth, for Solanum Wendlandi; Messrs. R. Harkness and Co., Hitchin, for roses; Misses K. and E. Hopkins, Shepperton, for rockery and rock plants; Messrs. W. Seagrave and Co., Sheffield, for violas; Mr. W. Iceton, Putney, for lily of the valley; Mr. H. H. Crane, Highgate, for violas and violettas; Messrs. J. Piper and Son, Bayswater, for trained box and yew trees; Messrs. Whitelegg and Page, Chislehurst, for alpine and herbaceous plants.

Silver Gilt Flora Medal.—Mr. G. W. Riley, Herne Hill, for garden furniture; Messrs. Wm. Wood and Son, Lim., Wood Green, for garden furniture.

Silver Gilt Banksian Medal.—Lamp Pump Syndicate, Carey Street, for lamp pump.

Silver Flora Medal.—Messrs. C. and W. Buswell, Torquay, for sundries; Mr. Castle, Millbank, for wooden garden furniture; Messrs. Thos. Green and Son, Lim., Southwark, for mowers; Messrs. Liberty and Co., Regent Street, for garden pottery, etc.; Potters' Art Guild, Guildford, for artistic pottery; Messrs. Ransomes, Sims, and Jefferies, Ipswich, lawn mowers.

Silver Banksian Medal.—Four Oaks Syringe Company, Birmingham, for sundries; Messrs. S. Pradal, Oxford Street, for patent tubs; Messrs. A. Shanks and Son, Cannon Street, for mowers; Messrs. W. Voss and Co., Millwall, for sundries.

Bronze Flora Medal.—Messrs. Doulton and Co., Lambeth, for garden pottery; Lloyd, Lawrence, and Co., Finsbury, for mowers; H. Scott and Sons, Woodside, for sundries.

Bronze Banksian Medal. — Messrs. W. Duncan Tucker, and Sons, Lim., Cannon St., for garden furniture; Messrs. Headly and Edwards, Cambridge, for garden furniture.

CERTIFICATES AND AWARDS.

First-Class Certificates.—To Primula Littoniana, from Messrs. Bees, Lim.; to Læliocattleya Martinetti The Prince, from Messrs. Sander and Sons.

Award of Merit.—To Nephrolepis magnifica, from Messrs. S. Low and Co.; to Rose Ariel, from Messrs. Paul and Son; to Roses Duchess of Wellington, Walter Speed, and Grace Molyneux, from Messrs. Alex. Dickson and Sons; to Delphinium White Queen, from Messrs. R. Wallace and Co.; to Carnation Lieutenant Shackleton, from Mr. Blick; to Cattleya Mossiæ (Wagneri) Sanderæ, from Messrs. Sander and Sons; to sweet peas Masterpiece and Mrs. H. Bell Improved, from Messrs. Dobbie and Co.; Mrs. Townsend from Messrs. Jarman and Co.; Doris Usher, from Mr. A. E. Usher; and Colleen, Mr. W. Deal.

Certificate of Appreciation. — To Messrs. Charlesworth & Co., for Miltonioda Harwoodi.

Cultural Commendation.—To Mr. J. Friedlander (gardener, Mr. F. Bright), for specimen fuchsias.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY COMING OF AGE SHOW.
SOPHIA GARDENS, CARDIFF,
WEDNESDAY and THURSDAY, July 21st and 22nd, 1909.

EXHIBITIONS AND MEETINGS.

◆

National Rose Society.

The National Rose Society's Metropolitan Show has now become something more than a great gathering of rosarians and other horticultural folk; it has become a great society function, and as such draws a great crowd if the day be fine. Fortunately, July 2 was a fine day, the first really fine day since Whitsuntide, and so there was a splendid attendance at the gardens of the Royal Botanic Society, Regent's Park.

Once again Her Majesty the Queen, accompanied by Princess Victoria, visited the show, and took a keen interest in the flowers. Miss Willmott, V.M.H., the Rev. Page Roberts, Mr. E. Mawley, V.M.H., and Mr. Chas. E. Shea, were in attendance upon her Majesty during her tour of the exhibition.

As a spectacle it was a good show; but from a rosarian's point of view it was a quite third-rate display, and there were many bare spaces on the tables, telling of hopes unfulfilled. The decorative section of the show was unusually attractive.

NURSERYMEN.

The competition for the trophy and gold medal that carries with it the nurserymen's championship is always keen, and the class for seventy-two blooms, distinct, invariably attracts a great deal of attention. This year there were five contestants for the honour, and premier position was secured by Messrs. Alex. Dickson and Sons, Royal Irish Nurseries, Newtownards, with a good set for the season. The best specimens were of C. J. Grahame, Lady Vincent, Killarney, Governor Roosevelt, Gustave Piganeau, Lyon Rose, Mrs. H. Brocklebank, Mdme Melanie Soupert (very fine), Caroline Testout, Mildred Grant, A. K. Williams, Dean Hole, Marchioness of Londonderry, Mrs. David McKee, Ulster, Bessie Brown, and Frau Karl Druschki. Messrs. B. R. Cant and Sons, Colchester, were placed second, many of their flowers being weatherbeaten. Messrs. Frank Cant and Co., Colchester, third, and the King's Acre Nursery Company, Hereford, fourth.

The class for forty varieties, three blooms of each, is a very interesting one. There were four competitors, and the first prize was won by Messrs. A. Dickson and Sons, Newtownards, who contributed good flowers of Rhea Read, Bessie Brown, Caroline Testout, Mrs. J. Laing, Frau Karl Druschki, Mrs. W. J. Grant, Mrs. David McKee, Tom

Wood, Joseph Hill, Mdme. M. Soupert, Mrs. H. Brocklebank, and John Cuff; Messrs. Frank Cant and Co., Colchester, second; and Messrs. B. R. Cant and Co., third.

In the second division of the nurserymen's section there were six competitors in the class for forty-eight blooms, distinct, and here the chief place was secured by Mr. George Prince, Longworth, Berks, and his best flowers in a moderate set were Maman Cochet, Mrs. David McKee, Ulrich Brunner, Johanne Sebus, Mrs. E. Mawley, Betty, The Bride, Souv. d'Un Ami, Caroline Testout, and Frau Karl Druschki; Messrs. G. Mount and Sons, Canterbury, came second; Mr. W. Leggett, West Bergholt, Colchester, third; and Messrs. J. Burrell and Co., Howe Nurseries, Cambridge, fourth.

The best twenty-four blooms, distinct, formed a class that brought out eleven competitors, Mr. Henry Drew, Longworth, Berks, leading with very fair specimens of Mildred Grant, J. B. Clark, Mdme. Ravary, Helen Keller, Bessie Brown, A. K. Williams, Florence Pemberton, Caroline Testout, Lady Ashtown, Gustave Piganeau, White Lady, Ulrich Brunner, Chas. Lefebvre, Robert Scott, Gladys Harkness, Countess of Annesley, Marchioness of Dufferin, Marchioness of Downshire, Francois Michelon, K. A. Victoria, Richmond, Wm. Shean, and C. J. Grahame; Mr. E. J. Hicks, Twyford, Berks, a good second; and Messrs. Perkins and Sons, Coventry, third. There were eight stands of sixteen trebles, the premier set coming from Messrs. George Mount and Sons, Canterbury, whose best blooms were of Mrs. David McKee, C. J. Grahame, Mdme. Melanie Soupert, Frau Karl Druschki, Richmond, Mildred Grant, Mrs. J. Laing, and Joseph Lowe; Mr. G. Prince, Longworth, second; and Mr. Henry Drew, Longworth, third.

In the open nurserymen's section Mr. E. J. Hicks, Twyford, led for a stand of eighteen blooms of any crimson rose, with good flowers of Richmond: there were six entries, and the King's Acre Nursery Company came second with Richmond. Messrs. Samuel McGredy and Son, Portadown, Ireland, were an easy first for a stand of any white or yellow rose with Mdme. Melanie Soupert, grandly shown, one of the blooms being the medal H.T. rose; The Devon Rose Nursery Company second with Frau Karl Druschki; and Mr. Hugh Dickson third; twelve entries. For any other than a yellow, white, or crimson variety, eighteen blooms in a stand,Mr. Walter Bentley, Belgrave, Leicester, was first with the pink H.T. Lady Faire; Messrs. A. Dickson and Sons second with Lady Ashtown; and Messrs. B. Cant and Sons third with Mrs. J. Laing; eleven entries.

Messrs. F. Cant and Co. led for a dozen flowers of White Maman Cochet; Messrs. D. Prior and Sons, Colchester, coming third. For a dozen flowers each of Frau Karl Druschki and J. B. Clark, Messrs. D. Prior and Sons were an excellent first with beautiful blooms; Messrs. G. Mount and Sons, Canterbury, second.

NURSERYMEN'S TEA ROSES.

The D'Ombrain Challenge Cup offered as the premier award for twenty-four tea and noisette roses, distinct, was won by Mr. George Prince, Longworth, with good flowers that showed some weather stains; the best varieties were Cleopatra, Bridesmaid, The Bride, Comtesse de Nadaillac, Muriel Grahame, Medea, Mdme. Jules Gravereaux, Mdme. Constant Soupert, Princess of Wales, White Maman Cochet, Molly Sharman Crawford, Golden Gate, and Comtesse de Nadaillac; second prize fell to Mr. Henry Drew, Longworth; and third to Mr. John Mattock, Headington.

Messrs. J. Burrell and Co., Cambridge, secured the first prize for a dozen tea roses with small, clean flowers of Medea, Hugo Roller, Niphetos, Anna Olivier, and Madame Jules Gravereaux; Messrs. G. Mount and Sons, second, and Messrs. W. and J. Brown, third. A pretty class is the one for fourteen varieties of tea or noisette roses, three blooms of each, arranged in vases, a space of 3ft. by 3ft. being allowed for each exhibit. There were three competitors, Mr. George Prince winning with a set that included Catherine Mermet, Souv. de Pierre Notting, Mrs. E. Mawley, The Bride, Madame J. Gravereaux, and Bridesmaid, in fine condition. Mr. H. Drew second, and Mr. J. Mattock third.

NURSERYMEN'S VASES AND DECORATIVE ROSES.

For a dozen varieties of roses, staged in vases, seven blooms of each, Messrs. D. Prior and Sons, Colchester, were first with Liberty, Maman Cochet, Obergartner Terks, John Ruskin, Lady Ashtown, Dean Hole, Caroline Testout, Mrs. W. J. Grant, Ulrich Brunner, Bessie Brown, and Madame Jules Gravereaux; Messrs. A. Dickson and Sons, Newtownards, second, and the Devon Rose Nursery Company, Torquay, third. Mr. John Mattock scored for nine varieties of tea and noisette roses, seven blooms of each, in vases, and he showed Souv. de Pierre Notting, White Maman Cochet, and Mrs. E. Mawley best; Mr. Henry Drew second, and Mr. G. Prince third.

Premier award for thirty-six distinct varieties of decorative roses was won by Messrs. Frank Cant and Co., Braiswick, Colchester, whose best roses were of Ed. Meyer, Anna Chartron, Marie Pavie, Mrs. E. G. Hill,Lady Battersea, and Gustave Regis; Mr. J. Mattock, Headington, Oxford, second, and Mr George Prince, Longworth, Berks, third. These exhibits were set out on separate tables 6ft. by 4ft. Mr. Charles Turner, Slough, led for eighteen bunches of decorative roses, and he had charming bunches of Madame Abel Chatenay, Mrs. Aaron Ward, Mrs. Peter Blair, Papa Gontier, etc.; Messrs. W. Spooner and Son, Woking, second, and Messrs. G. Cooling and Sons, Bath, third.

Mr. Charles Turner, Slough, led for eighteen bunches of garden roses, summer flowering varieties, and he showed such favourites as Rosa Mundi, Rene André, Red Damask, Una, Gardenia, and Pink Provence; Messrs. G. Cooling and Sons, Bath, second.

The finest collection of twelve varieties of single roses arranged on a space 6ft. by 3ft., was from Messrs. Frank Cant and Co., Colchester, who had splendid bunches of Irish Harmony, Morgenrot, Carmine Pillar, Irish Glory, Lady Curzon, Rugosa alba, Jersey Beauty, etc.; Messrs. Wm. Spooner and Sons, Arthur's Bridge, Woking, second, and Messrs. G. Cooling and Son, Bath, third.

NEW ROSES.

The best box of a dozen blooms of new roses came from Mr. Hugh Dickson, Belfast, who showed clean specimens of Queen of Spain, Lyon Rose, Miss Cynthia Horde, Mrs. Harold Brocklebank, W. K. Smith, Souv. de Fred Vercellonne, Rene Wilmark, Urban, Mrs. William Cooper, Madame Segond Weber, Madame Maurice de Luze, Mrs. E. W. Kershaw, Mrs. P. H. Coates. Second prize was awarded to Messrs. A. Dickson and Sons, and Messrs. Perkins and Sons, third; nine competitors. Messrs. A. Dickson and Sons, scored for nine flowers of any new rose with Lady H. Vincent; Mr. Hugh Dickson, Belfast, second with W. R. Smith, and Mr. G. Prince third with the Lyon Rose.

GROUPS OF ROSES.

For a representative group of roses arranged on a space not exceeding 250 square feet. Messrs. Hobbies, Lim., Dereham, gained the gold medal and first prize with a display that consisted largely of weeping standards of Dorothy Perkins and Lady Gay, these rising over dwarf specimens of the same varieties. Dwarf plants of Aennchen Muller, Mrs. W. H. Cutbush, and Baby Dorothy, with small vases of tea and hybrid tea roses, were used to form a border. Messrs. Paul and Son, Cheshunt, came a close second with pillars of the new Ariel, Buttercup, Electra, etc., with baskets and vases of Mrs. Peter Blair, Una, Le Progres, Richmond, Ulrich Brunner, Conrad F. Meyer, Farberkonigen, Madame Ravary, etc., in the foreground.

The finest group of cut roses arranged on the tabling, and occupying a space of 100 square feet, came from Messrs. George Mount and Sons, Canterbury, who won the gold medal, and set up a splendid exhibit, filling tall stands with lovely flowers or sprays of Richmond, Madame Abel Chatenay, F[illegible] Karl Druschki, Joseph Lowe, Mrs. J. Laing, Gustave Regis, Electra, Dorothy Perkins, Rene André, etc. Messrs. W. and J. Brown were an excellent second, putting up a beautiful exhibit; Mr. J. Mattock, Headington, third. There were five entries.

Messrs. Hobbies, Lim., Dereham, had the best arch of roses, covering a rustic arch with Tausendshon and Dorothy Perkins. Messrs. Paul and Son, Cheshunt, second with Goldfinch and Wallflower.

AMATEURS.

The amateur champion trophy for the best thirty-six blooms, distinct, was on this occasion won by Mr. Conway Jones, Hucclecote, Gloucester, with a set that did him great credit, but below championship form; his best flowers were C. J. Grahame, Marechal Niel, Gustave Piganeau, J. B. Clark, Captain Hayward, and Alice Lindsell; Mr. E. J. Holland second with a set possessing much merit; Mr. E. B. Lindsell, Bearton, Hitchin, third, and the Rev. J. H. Pemberton, Havering, fourth.

Alfred Tate, Esq., Downside, Leatherhead, scored for two dozen blooms in the open amateur class, and he was followed closely by Rev. T. G. Henslow, Chippenham, both showing fairly well. Mr. Conway Jones scored again for a dozen trebles, and here he had Hugh Dickson and Marechal Niel good; Mr. E. J. Holland second with fine flowers of Mildred Grant, White Maman Cochet, Mrs. T. Roosevelt, etc. The Rev. J. H. Pemberton had the finest nine flowers of one variety with Bessie Brown; Mr. E. J. Holland, Sutton, second, with Mrs. W. J. Grant; and Mr. G. A. Hammond, Burgess Hill, third with Mrs. J. Laing.

Mr. E. M. Eversfield, Denne Park, Horsham, won the Veitch Memorial Medal for twenty-four blooms in the class open to growers of fewer than 3,000 plants, and he was followed by Mr. C. C. Williamson, Wilstead, Canterbury, and both showed fairly well. Mr. Eversfield was also first in the section, both for a dozen trebles and [illegible] blooms of one rose, showing Lady Ashtown in the latter class.

The Captain Christy Cup for growers of fewer than 2,000 plants was won by Mr. W. R. Hammond, Grovelands, Burgess Hill, with a two-dozen set that contained a few good blooms and many poor ones; Rev. J. [illegible] Fellowes, Bunwell Rectory, Attleborough, second; and Rev. R. Powley, Upper Scudamore, third; there was a keen competition, but few good blooms. Mrs. E. Croft Murray, Perivale, Ryde, led for eighteen blooms; Mr. G. R. Bonnor, Gloucester, second; and Mr. G. Speight, Market Harborough, third. The best eight trebles came from Rev. R. Powley, who was followed by Mr. F. Slaughter, Steyning, and Mr. W. Colin Romaine, Old Windsor.

In the section open to growers of fewer than 1,000 plants, Dr. C. Lamplough, Alverstoke, scored for a dozen flowers; Rev. J. B. Shackle, Dropmore Vicarage, Maidenhead, second; and Mr. A. C. Turner, the White House, Walton-on-Thames, third. The Rev. J. B. Shackle had the best vase of five blooms.

The Grahame Memorial prize, [illegible] growers of fewer than 750 plants, was won by Mr. Harry Richards, West Ridge, [illegible] who had the best dozen blooms, and [illegible] contained Mdme. Jules Gravereaux, K. A. Victoria, Mildred Grant, Hugh Dickson, [illegible] Caroline Testout in fine style; Mr. E. Lehmann, Ifield Lodge, Crawley, second; [illegible] Rev. F. R. Burnside, Great Stambridge Rectory, Essex, third. Dr. Lamplough [illegible] extra class for six trebles, and he had a [illegible] set.

The Ben Cant Memorial prize, off[illegible] class for nine flowers, open to growers [illegible] fewer than 500 plants, was won by Mrs. [illegible] Moulden, Bandon, Stevenage, with [illegible] clean flowers of C. J. Grahame, Captain Hayward, White Maman Cochet, Mrs. [illegible] ley, Marquise Litta, Mrs. J. Laing, [illegible] Maman Cochet; Mr. Vivian Bell [illegible] Mr. Lewis L. Pawle, Ronsham, [illegible] third. Mr. G. C. Sawday, Rydal [illegible]

Weybridge, had the best six blooms, Mr. H. Clinton Baker, Bayfordbury, Hertford, coming second, and Mr. J. Gibb, Westfield, Reigate, third. In the same section Mr. V. Rolt had the best vase of five blooms—Mildred Grant, and Mr. J. Gibb was second.

In the extra class for a dozen flowers, Dr. Lamplough was a good first with a very bright set that included Hugh Dickson, White Maman Cochet, J. B. Clarke, Mrs. T. Roosevelt, and Bessie Brown in fine condition; Mr. C. F. H. Leslie, Epcombe, Hertford, second, and Mr. Vivian Rolt, Storrington, Pulborough, third. In the extra class for nine blooms, Mr. C. F. Brown, Slough, scored a first; Mr. W. P. Pankridge, Petersfield, second, and Mr. Alan Searle, Ashton Lodge, Bassett, third. Mr. E. M. Burnett, Westward Road, Southampton, had the best vase of five blooms—Lady Ashtown, and Mr. Kepel H. Gifford, Edensor, Slough, had the best set of four trebles, with Mr. Rolt second.

Mr. C. A. L. Brown, Hatfield Peverel, Essex, led for six blooms in the small growers' section with very fine examples of Mrs. Roosevelt, Bessie Brown, J. Ruskin, Florence Pemberton, Mildred Grant, and Dean Hole; Mr. W. G. Pedley, Hillside, Hoddesdon, second, and Mr. F. Barnatt, Well Hall, Eltham, third. There appeared to be about twenty competitors in this class for growers of less than 200 plants. In this same section Mr. A. E. Protheroe, Bourne House, Plough Lane, Purley, won for six flowers in not less than four varieties, followed by Mr. G. Gosling, Stratton Audley Park, Bicester, and Mr. A. Wilkinson, North Finchley.

The challenge cup for roses grown within eight miles of Charing Cross was won by Mr. Ramon de Escofet, Kingsley Dene, Green Lane, Dulwich, with six very fine, clean, and large flowers of Caroline Testout, Frau Karl Druschki, Mrs. J. Laing, Killarney, Florence Pemberton, and Captain Hayward—a beautiful set; Mr. H. Whitmee, The Briars, North Finchley, second; and Mr. H. Williams, Torrington Park, North Finchley, third.

The Rev. J. T. Kershaw, Corsley Rectory, Warminster, led for four trebles, and was followed by Mr. F. J. Borland, Stalheim, Sutton, Surrey; and the Rev. H. Tower, M.V.O., Holy Trinity Rectory, Windsor. In the maiden class for a dozen roses the honours fell in order of mention to Mr. G. R. Bourne, Barnwood, Gloucester; Rev. T. G. Henslow, Stanton St. Quintin, Chippenham; and Mr. E. Jackson, Rochford, Essex. Mr. J. Stuart, Broomhill, Harrow, led in the section for nine flowers; Mr. S. F. Jackson, Danehurst, Epsom, second; and Mr. C. W. Edwards, Ringstead Road, Sutton, third.

In the open extra class for amateurs, Mr. G. A. Hammond, Cambrian House, Burgess Hill, had by far the best set of two dozen flowers, his Mdme. Jules Gravereaux, Mdme. Melanie Soupert, Frau Karl Druschki, Mrs. J. Laing, Richmond, Caroline Testout, and Mrs. T. Roosevelt being good examples; Mr. Conway Jones second, and Mr. E. M. Eversfield, Horsham, third.

Mr. Hammond led for a dozen blooms, winning the Harkness cup with a good set, in which Mildred Grant, and Mrs. Theodore Roosevelt were excellent; Mr. Alfred Tate second. Mr. Eversfield was first for a set of nine teas and nine hybrid teas, with good blooms, all, unfortunately, weather marked; he was the only exhibitor. Mr. Conway Jones staged the best six new roses, with Rev. J. H. Pemberton second; Mr. Jones had Lady H. Vincent, Mrs. Brocklebank, Laurent Karl, Molly Shawman-Crawford, Lady Ursula, and Wm. Shean.

Miss B. H. Langton led for a collection of roses, not more than seven varieties; Mr. H. R. Darlington second, and Mrs. Wightman, Bengeo, Herts, third.

Mr. J. Ockendon, West Green, Crawley; Mr. E. M. Burnett, Westward Road, Southampton; Mr. F. H. Fieldgate, Shrub End Road, Colchester; Mr. H. Honeychurch, Enfield; Mr. R. Dow, Lowood Hasketon, Woodbridge, were other prize-winners in amateur classes.

AMATEURS' TEA ROSES.

Mr. Conway Jones, Hucclecote, Gloucester, won the amateurs' tea rose trophy and championship, with two dozen blooms, his set consisting of Mrs. E. Mawley, Mdme. E. Labelles, Mdme. Vermorel, Cleopatra, Souv. d'Un Ami, Lady Roberts, Souv. de S. A. Prince, F. Von Marechall, Mdme. Constant Soupert, Harry Kirk, Maman Cochet, White Maman Cochet, Mdme. J. Gravereaux, Mrs. Myles Kennedy, Marechal Niel, Souv. de Pierre Notting, Medea, and Niphetos.

The Prince Memorial Cup for a dozen tea roses was won by the Rev. J. R. Fellowes, Attleborough, and he had good flowers of Cleopatra and Mdme. Jules Gravereaux; Mr. E. M. Eversfield second; and Mr. A. Tate third. Mr. Eversfield had the best vase of a tea rose, showing Souv. de S. A. Prince.

Rev. R. Powley, Upton Scudamore, led for a dozen tea roses in the section open to growers of less than 500 plants, and he had good flowers of Freiher van Marechal, White Maman Cochet, and Mrs. E. Mawley, Mr. G. R. Bonner, Barnwood, Gloucester, second; and Mr. H. R. Darlington, Park House, Potters Bar, third. The best nine teas came from Mr. F. Slaughter, whose varieties were Maman Cochet, White Maman Cochet, Mrs. E. Mawley, Mdme. Constant Soupert, Mdme. Jules Gravereaux, Souv. de Pierre Notting, Marie Van Houtte, Mdme. Verniell; and Boadicea; Mr. A. Evans, Marston, Oxford, second; and Mr. M. Whittle, Belgrave, Leicester, third. Mr. H. C. Baker, Bayfordbury, led for six tea roses, with Dr. Lamplough second, and Mrs. E. Horne, Reigate, third.

In the extra amateurs' class for trebles, teas, and noisettes, Dr. Lamplough, Alverstoke, scored with Mrs. Edward Mawley, Comtesse de Nadaillac, White Maman Cochet, and Madame Jules Gravereaux; Rev. R. Powley second, and Mr. M. Whittle, Leicester, third. In an extra maiden class for six roses in not less than three varieties, Miss Langworthy, Gays House, Holyport, led.

AMATEURS' DECORATIVE ROSES.

Mr. Alfred Tate led for eighteen bunches of decorative roses, with a glorious display, wherein Gustave Regis, Lady Curzon, Gloire de Rosamanes, and Gottfried Keller were excellent; Rev. J. H. Pemberton, Havering, second. For a dozen bunches of decorative roses Lady Sutton, Barban Valence, Newbury, was a comfortable first, showing Carmine Pillar, Bardou Job, Aglaia, and Irish Beauty, finely; Mr. Conway Jones, second.

Mr. Edward Mawley led for six bunches of decorative roses, followed by Mr. C. L. Gordon Clark, Fetcham Lodge, Leatherhead. Sweet Briar roses, six bunches, were best shown by Lady Sutton, who set up Amy Robsart, Anne of Geierstein, Meg Merrilees, Rose Bradwardine, Jeannie Deans, and Flora Norton; Mrs. E. Horne second, and Mr. H. R. Darlington, Potter's Bar, third.

In another class for half a dozen bunches of decorative roses, Miss B. H. Langton scored with splendid bunches of Macrantha, Una, Hebe's Lip, Lady Curzon, Carmine Pillar, and Rugosa alba, Rev. J. H. Pemberton second. The Rev. J. B. Shackle was first, and Mr. H. E. Molyneux second for five bunches of garden roses. Mr. O. G. Orpen led for five stands of garden roses with fine sets of Una, Dawn, Crimson Damask, Moschata alba, Bardou Job, and Maharajah; Rev. J. H. Pemberton, second, and Miss B. H. Langton, third.

LADIES' CLASSES.

There was a fine competition in the lady amateur's class for a circular table decoration, ten competing. First prize was won by Miss West, Firth Dene, Reigate, who used Richmond rose most effectively; Miss J. B. Langton, Raymead, Hendon, second, and Mrs. O. G. Orpen, West Bergholt, Colchester, third with a design in Gottfried Keller and Una that attracted more attention than any other. Mr. Orpen's prize for an ordinary table decoration was won by Mrs. W. Smith, Sparrow Hewe Hall, Bushey Heath, with a lovely design in Irish Elegance; Mrs. C. Lamplough second, and Mrs. A. T. Booth, Lynton, Westbury Road, Woodside park, N., and Mrs. F. H. Cooke, Birch, Colchester, equal thirds. There were thirteen entries.

Mrs. T. H. Cooke had the best bowl of exhibition roses, showing Mrs. W. J. Grant. Miss J. B. Langton had the best bowl of decorative roses, using Dawn. Mrs. Orpen second with Lady Curzon. Mrs. W. Smith led for a vase of roses, and Miss J. B. Langton came second, with Mrs. E. Mawley third. Mrs. Orpen led for a basket of roses, using Irish Beauty and Irish Elegance in beautiful style; Mrs. T. H. Cook second with a basket of Madame Abel Chatenay, and Miss A. F. Harwood, Colchester, third. Mrs. Duckworth, Elmstead, Twickenham, had the best bowl of Wichuraiana roses, and Miss J. B. Langton came second. Mrs. H. Williams, Torrington Park, North Finchley, was first for a bowl of decorative roses, showing Madame Abel Chatenay finely; Miss E. M. Robinson, Hornchurch, second.

Miss M. Fodea, Marlowe's Nurseries, Hemel Hempstead, led in the ladies' (traders') class for a table decoration of roses, winning with a well-finished design of Madame Abel Chatenay; Mrs. E. P. Butcher, Upper Brook Street, Ipswich, second with bronzy varieties, and Miss Ada Townsend, Lower Broadheath, Worcester, third. For a bowl of roses, Miss Ada Townsend, with Liberty, Mrs. A. R. Bide with Simplicity, and Miss Harkness with Madame Abel Chatenay, won the awards in the order of mention.

GOLD MEDAL ROSES.

Mr. Hugh Dickson, Belfast, secured a gold medal for Countess of Shaftesbury, a big rosy-pink flower, and also a gold medal for Lady Pirrie, a delightful salmon-orange-pink combination in a H.T. variety. This firm secured a card of commendation for the single yellow Muriel Jamieson.

Cards of Commendation were awarded to Messrs. McGredy and Sons, Portadown, for Mrs. Herbert Stevens; to Dr. Campbell Hall for a single scarlet seedling; to Messrs. W. Spooner and Son, Woking, for Thelma, a single rose-pink flower; to Mr. T. M. Bradley, Peterborough, for Climbing Lady Ashtown; to Messrs. A. Dickson and Sons, Newtownards, for Theresa, a pretty copper-shaded pink variety; and to Messrs. Paul and Son for Ariel.

SILVER MEDAL ROSES.

The medal blooms, or best blooms were as follows:—Nurserymen—Messrs. A. Dickson and Sons for a H.P. with A. K. Williams; Messrs. S. McGredy and Son, for a H.T., with Madame Melanie Soupert; and to Mr. H. Drew for a T. rose with Mrs. E. Mawley. Amateurs—To Mrs. Croft Murray, Isle of Wight, for a H.P., with Mrs. J. Laing; to Mr. E. B. Lindsell, Hitchin, for a H.T., with Mildred Grant; and to Mr. F. Slaughter, Steyning, for a tea rose, with Maman Cochet.

Hanley Floral Fete.

It is possible that the Hanley Fete, held in Hanley Park on July 7 and 8, will be the last held under the present title, because, under the federation of the Pottery Towns, the title of the next great show will probably be Stoke Floral Fete. The good folks of Hanley are most enthusiastic over their show, and well they may be, for in the first place it is not so very many years since a large part of the present site of 65 acres, comprising the beautiful park, consisted of pits and heaps of mine and furnace refuse. The exhibition filled five big tents this year, and there were nearly 500 entries. There is a large, hard-working committee, and a staff of stewards, all keen and reasonable men who, under the genial lead of Mr. Wm. Poulson, the secretary, carry out their duties admirably, and give timely help to a hurried Press man.

Roses, groups, table decorations, and specimen plants were the leading features, but the children's show, consisting of over 2,000 entries, is not the least important part of the committee's work. One fine class here was for a diary of the flowers, plants, and trees in the public parks, kept in exercise books by the children. There were 240 such diaries, and one little chap had noted some characteristics of no fewer than 161 distinct plants. Many had made sketches to illuminate the text, and a few had even coloured their sketches. We wish the Pottery people good luck in this interesting educational work.

GROUPS AND PLANTS.

There was but one exhibitor in the class for a group of orchids, so that Messrs. J. Cypher and Sons, Cheltenham, had a walk over, and secured the silver challenge cup offered by Thos. Godwin, Esq., in addition to the substantial money award of £15. The arrangement was a large semicircular one, on a table, and here, with a pleasing association of ferns and palms, the Cheltenham firm displayed Cattleya gigas, Vanda cærulea, Epidendrum prismatocarpum, Anguloa Clowesi, miltonias, Masdevallia tovarensis, odontoglossums in variety, thunias, and numerous cypripediums.

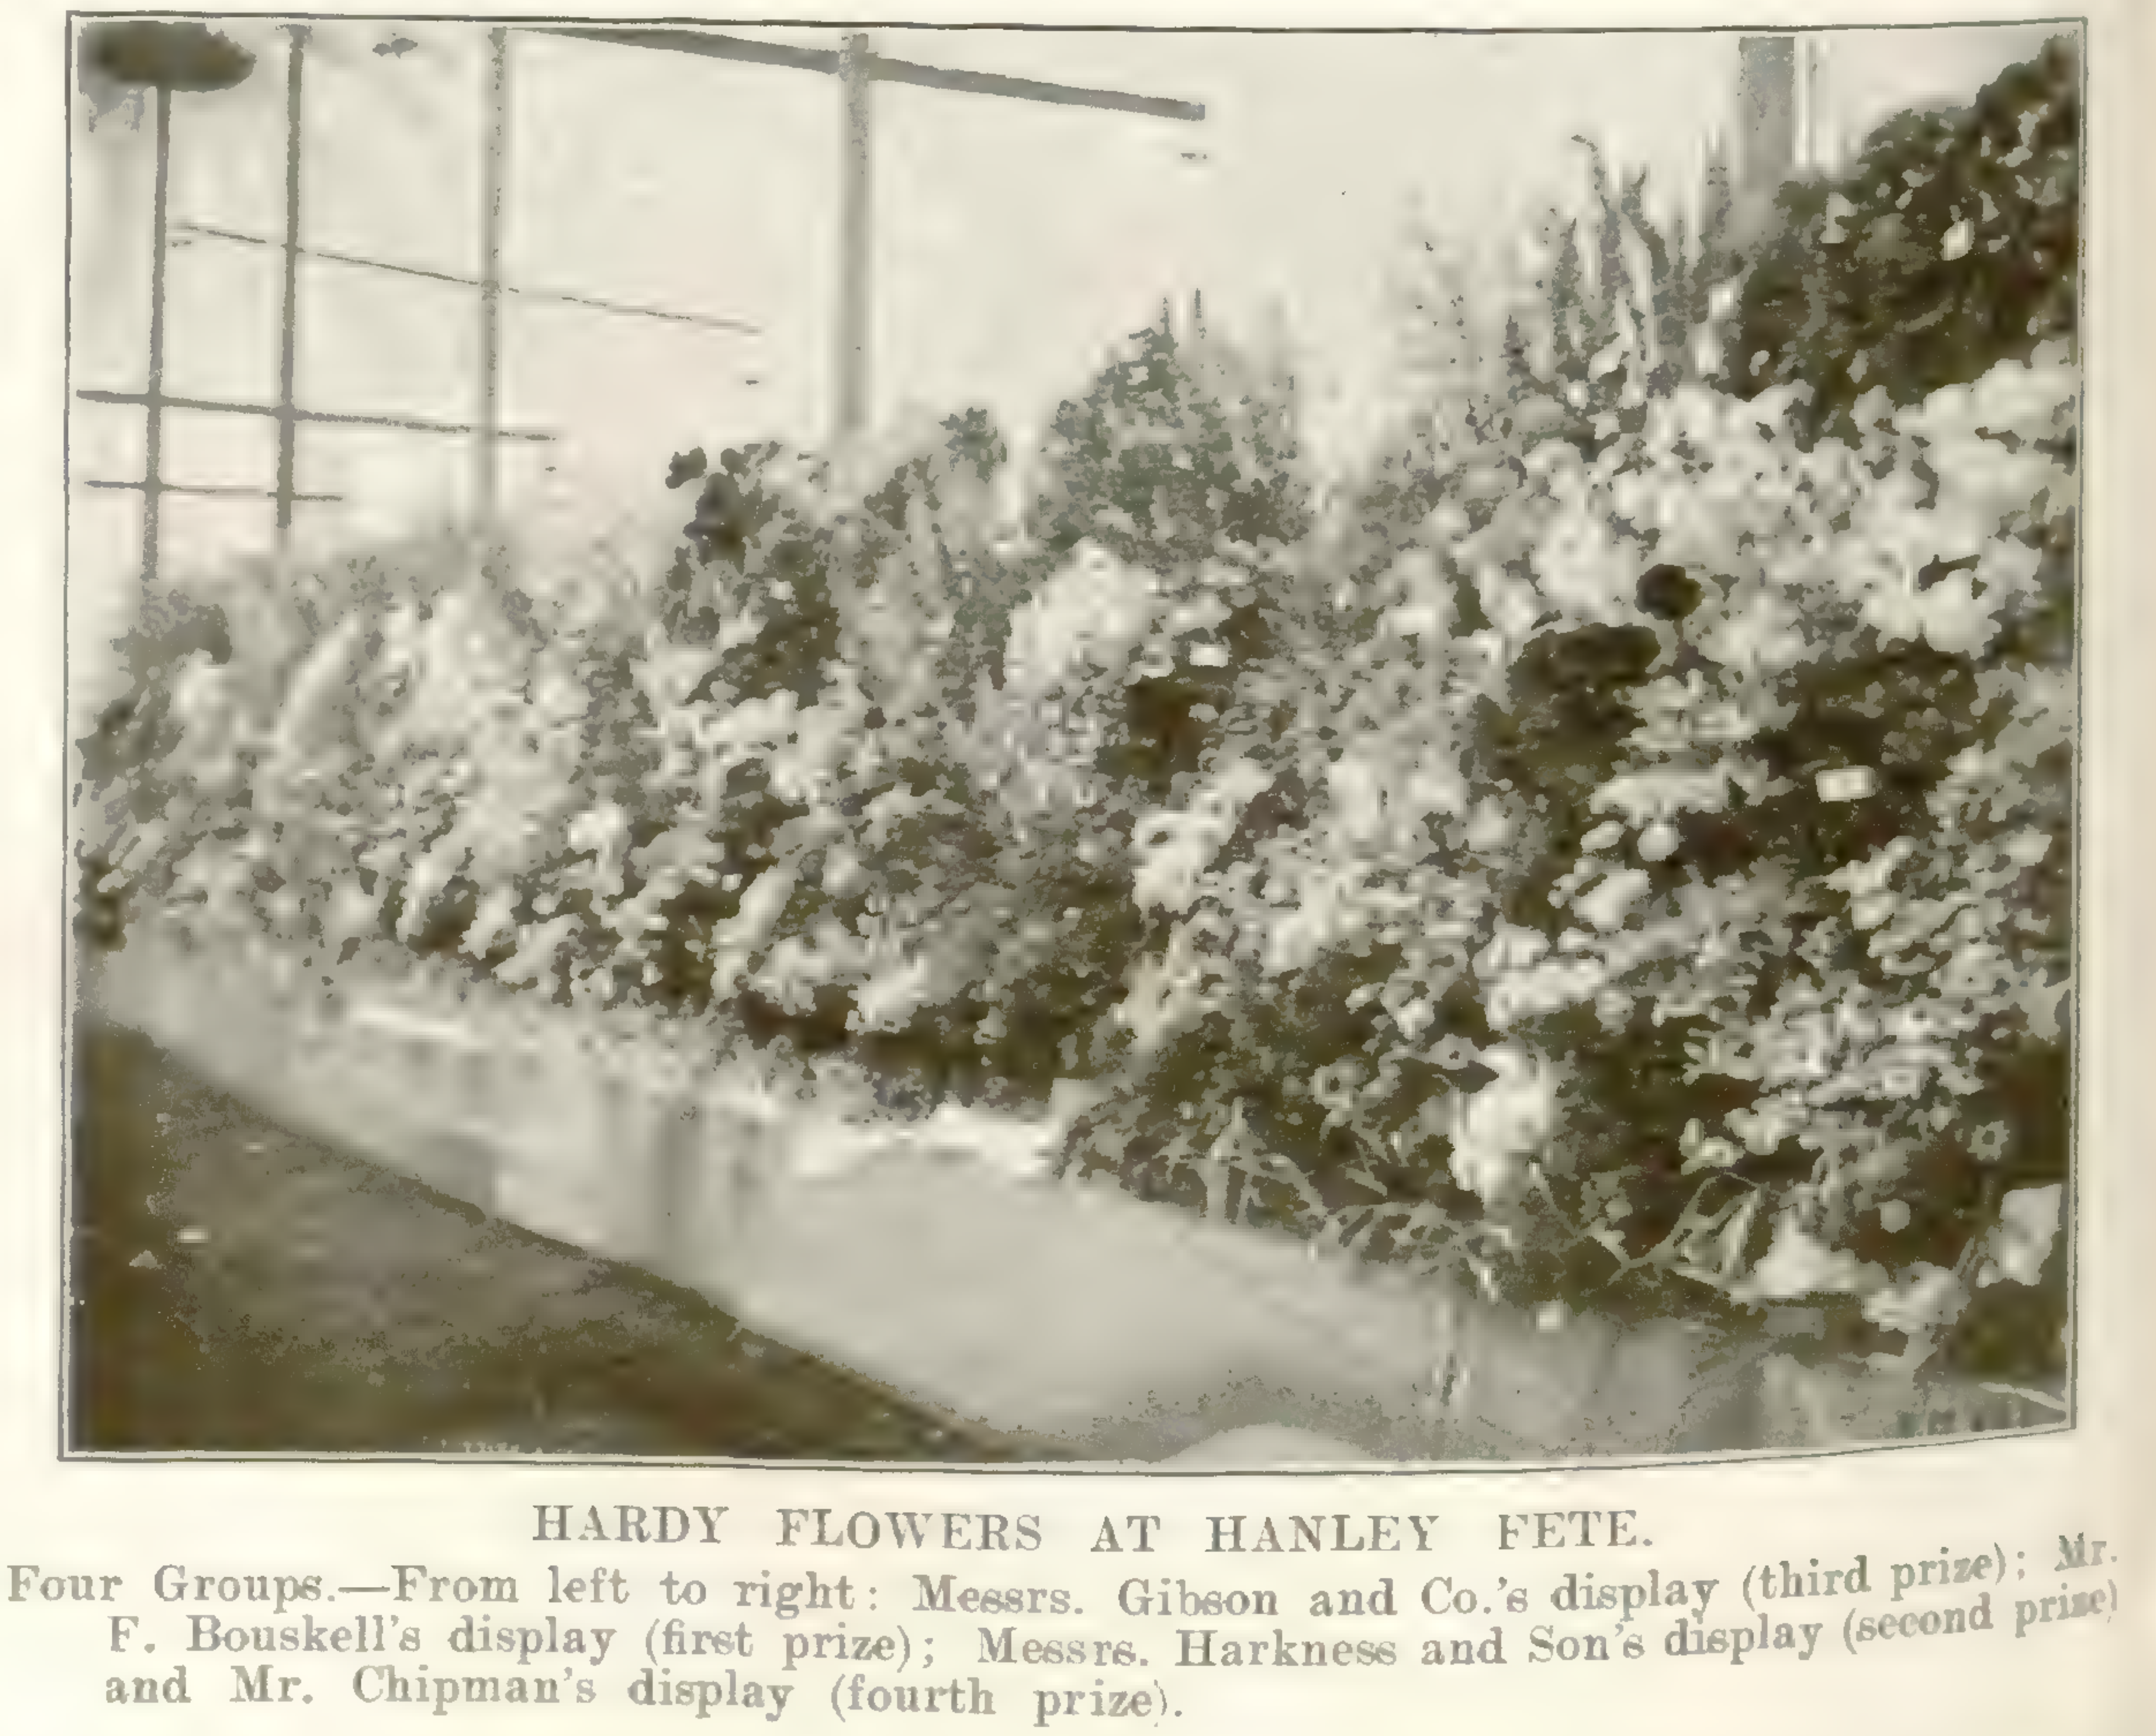
FIRST PRIZE AMATEURS' GROUP AT HANLEY FETE.
Exhibited by Mr. Chas. Roberts, gardener to Mrs. Swann, Halston Hall, Oswestry.

In the principal group class an arrangement on an area of 300 square feet was necessary, and prizes of £25, £20, £15, £10, and £6 were offered, with a special prize of £6 6s. added to the premier award by Messrs. Brown-Westhead, Moore, and Co., of Hanley, and a special of £3 3s. added to the second award by Messrs. Taylor, Tunnicliffe, and Co., of Hanley. The displays were all nearly square, and presented two sides to direct view. Premier honours were secured by Messrs. J. Cypher and Sons, Cheltenham, among five competitors, and they put up a very beautiful exhibit with a graceful centre arrangement of palms, dracænas, crotons, and light roses. The corners were marked by mounds of ferns and crotons, with arching sprays of odontoglossums, and a forward central mound at either side was composed largely of orchids. Some splendidly grown crotons rose as isolated specimens over the intervening groundwork, and cattleyas, ferns, Rex begonias, liliums, and caladiums were used in the "valleys," while green moss gave a good finish to the whole. Mr. Wm. A. Holmes, West End Nurseries, Chesterfield, secured second place, and had some splendid crotons, but he lacked flowering plants; Mr. Wm. Vause, Leamington, won the third place, using Dorothy Perkins roses freely; Messrs. R. Simpson and Son, Selby, Yorks, fourth.

In the amateurs' section great interest centred in the class for a group arranged on 200 square feet, and here there were four entries. The first prize of £10 10s. was won by Mr. Chas. Roberts, gardener to Mrs. Swann, Halston Hall, Oswestry, whose combination was a rather unique one. He had fine examples of Dracæna Victoria, good crotons, gloxinias, anthuriums, liliums, amaryllis, excellent specimens of Phœnix Roebelini, and under a central pendulous Dorothy Perkins rose he grouped dwarf sweet peas and carnations. It was a fine effort, and only needed about half a dozen good odontoglossum spikes to give it a final touch of beauty. Mr. B. Smith, gardener to J. A. Maddock, Esq., The Cedars, Alsager, was second, and Mr. A. Ruff, gardener to J. Tams, Esq., The Hayes, Stone, Staffs, third, the latter showing a very bright design, in which liliums were very prominent.

Messrs. J. Cypher and Sons secured first prize for eight orchids with large examples of Lælio-cattleya callistoglossa, Vanda cærulea, Cypripedium A. de Lairesse, Miltonia vexillaria, Epidendrum prismatocarpum, Cattleya Gaskelliana, C. gigas, and C. Mendeli. Mr. Wm. Vause, Leamington, took second place, showing a good Cymbidium Lowianum, Sobralia macrantha, etc.

Messrs. Jas. Cypher and Sons, Cheltenham, led for six specimen foliage and six specimen flowering plants (twelve plants in all), and showed giant examples of Croton Countess, C. Warreni, Kentia Forsteriana, K. australis, Ixora Williamsi, Allamanda nobilis, Erica ventricosa magnifica, a huge E. Cavendishiana, and Bougainvillea Cypheri; Mr. Wm. Vause, Leamington, was a good second. The best six plants in bloom came from Cheltenham, the Messrs. Cypher putting up very fine examples of Allamanda Hendersoni, Bougainvillea Cypheri, Erica depressa, E. ventricosa magnifica, Statice Gilberti, and Ixora Williamsi; Mr. Vause was second, and he had Statice profusa and S. intermedia in fine condition.



HARDY FLOWERS AT HANLEY FETE.
Four Groups.—From left to right: Messrs. Gibson and Co.'s display (third prize); Mr. F. Bouskell's display (first prize); Messrs. Harkness and Son's display (second prize) and Mr. Chipman's display (fourth prize).

The class for six palms was well filled, and the tall specimens made up a graceful central feature in the rose tent; the awards fell, in order, to Messrs. J. Cypher and Sons, Mr. Wm. Vause, and Messrs. R. Simpson and Sons.

In the local amateurs' classes some remarkably good plants were shown, giving evidence of what careful attention will produce, even in the Black Country. Mr. G. A. Donkin, Cemetery View, Longton; Mr. C. Becket, Woodend Road, Hanley; and Mr. W. J. Lawton, Kent Green, Stoke, secured the awards for a group of plants; and Mr. Jervis Vickers, Beresford Street, Hanley, was particularly successful in the plant classes, scoring for three fuchsias, three zonal pelargoniums, twelve greenhouse plants—a fine set of pelargoniums and fuchsias, staged in a keen competition, for six greenhouse plants in bloom, and for three pelargoniums.

In other plant classes, Mr. H. Hughes, Newcastle, Staffs, was successful for zonal pelargoniums; Mr. T. Parry, Park Road, Wollaston, Nantwich, for exotic ferns; and Mr. A. Handley, Coulton Road, Burslem, for fuchsias.

FLORAL DESIGNS.

Some startling displays of floral art were made in the special class for a collection of designs. There were three competitors, each having a space 15ft. by 6ft. The chief award of £10 was won by Messrs. Lewis and Sproson, Penkhull Nurseries, Stoke-on-Trent, who had a big Dreadnought made of pinks, and a Zeppelin airship of carnations; but their chaplet and crescent of roses, and harp and lyre of pinks, were charming. The King's Acre Nursery Company, Worcester, had a fine floral swan of pinks and white lily petals, and a large harp of pinks and cattleyas, and they won second place; Mr. Amos Carr, High Street, Cheadle, had a tall pergola of Japanese irises and pinks as a chief feature.

The class for a dinner table, decorated with roses and foliage, brought five entries, all of which were of considerable merit. The premier position was secured by Mr. W. T. Mattock, Headington, Oxford; Mr. W. J. Garner, Hale, Altrincham, being second; and Messrs. Lewis and Sproson, Penkhull

H. J. GASSON, Net Works, RYE.
Established 126 Years.

Nurseries, Stoke-on-Trent, third. An additional prize was awarded to Messrs. Townsend and Sons, Worcester. In a similar class, but for a table decorated with flowers, other than roses, there were nine entries, five being devoted to carnations, and four to sweet peas. The first prize was claimed by Messrs. Lewis and Sproson, whose tasteful arrangement was distinctly pleasing. Mr. W. J. Garner followed, and third prize fell to Mr. J. White, jun., 22, Silverdale Road, Newcastle, Staffs. Mr. Wm. Marple, Penkridge, came fourth with his table of sweet peas, and Mr. W. T. Mattock was awarded a special prize for roses.

CUT FLOWERS.

A large number of classes were devoted to roses, and in all of these the competition was very keen, and the blooms, though still showing signs of bad weather on the outer petals, were cleaner than at the Metropolitan Rose Show. Messrs. Frank Cant and Co., Colchester, led for seventy-two roses with a very clean set of blooms, their Mildred Grant, Frau Karl Druschki, and White Maman Cochet being beautiful examples; Mr. Hugh Dickson, Belfast, second; Messrs. R. Harkness and Co., Hitchin, third; and The King's Acre Nursery Company, Hereford, fourth. The best set of forty-eight varieties of roses, distinct, came from Messrs. R. Harkness and Co., Hitchin, whose Mdme. Jules Gravereaux, Mdme. Melanie Soupert, and Hugh Dickson were fine specimens; Messrs. Perkins and Sons, Coventry, second, with a large number of light-coloured flowers; Messrs. Townsend and Son, Worcester, third; and Mr. Hugh Dickson, Belfast, fourth.

A class for new roses is always of great interest, and the one here for twelve introduced during 1907-8-9, arrested a great deal of attention. Mr. Hugh Dickson, Belfast, led with Mrs. S. Clarke, Miss Cynthia Forde, G. C. Waud, Yvonne Vacherot, Rene W. Nolan, Queen of Spain, Mdme. Segond Weber, W. K. Smith, Lyon Rose, J. Cuff, and Lady Helen Vincent; Messrs. Perkins and Sons second; and Messrs. Frank Cant and Co., third.

Mr. Hugh Dickson scored for three dozen varieties of roses, three blooms of each, and his best sets were of Lyon Rose, General McArthur, Mrs. David McKee, Mdme. Melanie Soupert, and Joseph Hill; Messrs. F. Cant and Co. a good second; The King's Acre Nursery Company third; and Messrs. Townsend and Son fourth. Messrs. Perkins and Sons were first, Messrs. F. Cant and Co. second, Mr. Hugh Dickson third, and Mr. W. J. Mattock fourth for two dozen H.T. roses, in a class of eight entries.

Mr. W. J. Mattock secured the premier award for two dozen tea-scented roses, and was followed in order by Messrs. Frank Cant and Co., and Messrs. Townsend and Son. Messrs. Frank Cant and Co. had the best box of twelve white roses, and Messrs. Perkins and Sons came second, each showing Frau Karl Druschki.

Sweet peas were well shown, and for a dozen bunches Mr. Marple, Penkridge, was first with clear, bright flowers of Helen Lewis, Primrose Spencer, Evelyn Hemus, etc.; Mr. J. Bowler, Woodseaver, Market Drayton, second; and Mr. W. White, Highlands, Newcastle, Staffs, third. Mr. A. H. Hickman, Cooking, near Kidderminster, won first prize in Mr. H. Eckford's class for twelve bunches, and also led in Messrs. Webb and Sons' class for six bunches; Mr. C. Holden, Tavistock, New Ascott, Birmingham, led in the class for six bunches, provided by Messrs. Bakers.

A splendid bank of hardy flowers was made up by the displays of the four competitors in the class for a display made on a space 16ft. by 4ft., and here the chief award of £10 was well won by Mr. F. Bouskell, Market Bosworth, Nuneaton, an amateur grower, who had a glorious lot of delphiniums, campanulas, irises, poppies, pyrethrums, and no fewer than ten varieties of verbascums, including several of his own seedlings that give new shades of colour. Messrs. Harkness and Sons, Bedale, second; Messrs. Gibson and Co., Leeming Bar, Bedale, third; and Mr. Wm. Chipman, Chester Road, New Ascott, Erdington, Birmingham, fourth.

FRUIT AND VEGETABLES.

The leading class for fruit was for a dessert table, set with not more than fourteen dishes of fruits, and decorated with flowers and foliage. The first prize was secured by Mr. J. Doe, gardener to Lord Saville, Rufford Abbey, Notts, and the quality of the fruit and the tasteful arrangement were alike excellent. Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, was second. For a collection of twelve dishes of fruit, decorated with plants or cut flowers, the leading award was secured by Mr. J. H. Goodacre, Elvaston Castle, Derby, and his grapes and pineapple were good; pink Malmaisons were effectively used as decorative material. Mr. Wm. Nicholls, gardener to Lady Beaumont, Carlton Towers, York, was second.

For six dishes of fruit, first prize fell to Mr. T. Bannerman, gardener to Lord Bagot, Blythfield Hall, Rugeley; and second to Mr. J. Doe, Rufford Abbey. Mr. Wm. Nicholls, Carlton Towers, led for four bunches of grapes, and Mr. T. Bannerman was second. Mr. Doe also scored for two bunches of Black Hamburgh grapes; Mr. Alfred Ruddock, gardener to E. A. Young, Esq., Tanybryn, Bangor, being second; and Mr. Goodacre third. For any other variety of black grapes, Mr. Alfred Ruddock led with Gros Maroc; Mr. W. Nicholls was second, and Mr. T. Bannerman third. For two bunches of White Muscat grapes, Mr. Goodacre led, Mr. Wm. Nicholls and Mr. J. Doe following in the order given. In the "any other variety of white" class, Mr. Wm. Nicholls and Mr. T. Bannerman won in the order named.

Mr. Wm. Nicholls was particularly successful in the vegetable classes, winning firsts in all three classes, viz., the open class, the special class provided by Messrs. E. Webb and Sons, and also that of Messrs. Sutton and Sons. Really good peas, cauliflowers, and tomatoes were features in all three collections.

NON-COMPETITIVE EXHIBITS.

A fine display of vegetables, flowers, and plants was arranged by Messrs. E. Webb and Sons, Wordsley, Stourbridge. Sweet peas on tall stands were an outstanding feature, and brilliant gloxinias, white liliums, and Hydrangea paniculata added to the elegance of this exhibit; while the vegetables were, of course, of excellent quality. Mr. Robert Bolton, Warton, Carnforth, staged sweet peas, and his fine bunches of Elsie Herbert, Mrs. A. Ireland, Helen Lewis, and many other good sorts were lightly arranged in clear glass vases. From Messrs. Jarman and Co., Chard, came roses, zonal pelargoniums, a few carnations, and a batch of their delicately tinted sweet pea Mrs. Townsend. A small group of Spanish irises, early-flowering gladioli, and border flowers was arranged by Messrs. Thos. Davies and Co., Wavertree, Liverpool. Mr. Edmund Cole, Rosarian Nurseries, Ashbourne, showed sweet peas. Mr. W. T. Mattock, Barton End Nursery, Oxford, made a nice display of roses, in which hybrid teas and teas were largely used in bunches, a few tall stands breaking the general level.

Mr. H. N. Ellison, West Bromwich, put up a very useful collection of ferns, showing Adiantum Farleyense, nephrolepis, and davallias in good style. Mr. Thos. W. Darlington, Warton, Carnforth, showed sweet peas, using fancy baskets as receptacles. From Messrs. Clibrans, Altrincham, came a large group of well-grown Dimorphanthus mandschuricus variegatus.

LONDON POTATO MARKETS.

New potatoes are fairly plentiful, but not so good as usual, owing to lack of sunshine. The demand is steady.

ANSWERS TO CORRESPONDENTS.

NEW NEPHROLEPIS. — Somerset: Nephrolepis todeaoides was introduced by Messrs. T. Rochford and Sons, Broxbourne, awarded a first-class certificate by the Royal Horticultural Society on October 7, 1906, and was figured in our issue of October 27, of that year, p. 710. Nephrolepis Whitmani was raised in the United States, we figured it on p. 107, February 16, 1907, and it gained an Award of Merit in London on February 12, 1907, when shown by Messrs. Hugh Low and Co. Nephrolepis Amerpohli is also an American-raised variety, but we do not remember the exact date of its debut in this country, but we remember it was well shown at the Temple Show of 1908 by Messrs. J. Hill and Sons, of Edmonton.

AMERICAN GOOSEBERRY MILDEW.—N. F., Effingham: The fruits are not affected by the American Gooseberry Mildew, but the leaves are suffering from an attack of red-spider. Give the trees a few good hosings, and then spray them with a nicotine and soft soap solution. We believe the American Gooseberry Mildew was first discovered in this country as a possible epidemic near Tewkesbury in 1906.

SEEDLING SWEET PEAS. — F. E. R., Cambridge: It is very desirable to secure good growth on the plants before allowing them to seed, for if they are permitted to set seeds at once growth will be greatly checked, and the crop thereby reduced. Cut off all the flowers for another fortnight, and then permit the plants to go to seed. Where the quantity dealt with is comparatively small, it pays to examine the rows once or twice a week, as soon as the seeds begin to ripen, and remove the ripe pods, placing these in labelled bags or boxes to await the final shelling and cleaning.

TOMATOES FOR SEED.—E. H., Timperley: Pick the fruits as soon as they are ripe, i.e., ripe enough to eat raw, and place them for a few days on a greenhouse shelf, in the sunshine. Then cut each fruit in half and remove the seeds with a small spoon or other suitable implement, and place them in a hair sieve. Give a thorough washing with clear water, drain, and spread out on paper in a sunny position to dry. It may be necessary to mix the seeds with fine dry silver sand and spread a thin layer on boards or paper in a greenhouse, where sunshine can reach them; a good rubbing of the seed and sand mixture between the hands, as the mass becomes nearly dry, will remove the sticky juice, and, after a little further drying, the sand with the impurities may be sifted away from the seed. Some varieties are more difficult to clean than others, and in some instances a thorough washing in a deep hair sieve, under a tap of water, will suffice, to be followed by drying in the sunshine.

BEDDING ROSES.—H. P. J., Hereford: We strongly recommend you to visit rose gardens and rose nurseries this season, and make notes of roses that are useful for beds and pleasing to yourself. We may add, for your assistance in note-taking and observation, that the following are all of great excellence for the purpose, and can be strongly recommended:—Hybrid Perpetuals: Captain Hayward, Dupuy Jamain, Frau Karl Druschki, General Jacqueminot, Mrs. John Laing, Mrs. R. G. Sharman Crawford, Paul Neyron, Ulrich Brunner. Hybrid Teas: Augustine Guinnoiseau, Camoens, Caroline Testout, La France, Madame Ravary, Marquise of Salisbury, Mrs. W. J. Grant, and Princess [illegible]. Tea-scented: Corallina, Dr. Grill, [illegible]tress, General Schablikine, Gloire de [illegible], Janet Lord, Madame Host, Marie Van Houtte, Mrs. B. R. Cant, and Raoul Chauvry. Chinas: Common China, Duchess [illegible] York, Fabvier, Laurette Messimy, Madame E. Resal, and Queen Mab. General Jacqueminot and Gloire de Dijon should, at the time of after pruning, have their long shoots slightly shortened, and then pegged down to within a few inches of the surface. These long shoots will produce growths and flowers through the greater part of their length, and produce an exceedingly beautiful effect. If the long shoots are shortened, as in the case of the moderate growing varieties, they will produce other stout shoots, and there will be but few flowers.

ANTS ON NECTARINE AND PEACH TREES.—I. H., Kingscliffe: When ants have once made themselves at home in a fruit house they are a great nuisance, and do no small amount of harm. The first thing to do is to locate the nest, and if this is in a position where strong measures may be taken without any harm resulting to the contents of the house, then carbolic acid diluted with about ten times its weight of water, poured into the nest will account for most of the ants. Undiluted paraffin will answer the same purpose, and some should be poured in every few days until all evidence of the ants is obliterated. If the nest cannot be dealt with in this or similar manner, with oils or poisons, it may be possible to use very hot water, almost at boiling point, because very few roots would be killed by the heat of the water if care were taken to pour it directly into the nest. Failing the opportunity to use these methods, then trapping must be resorted to. Sponges dipped in treacle; black treacle spread on brown paper; and half-picked bones; all form excellent traps for ants, but whatever trap is used it must be persevered with. Place a broad piece of brown paper round the stem of the tree, near the ground, gum down the overlapping edges, and tie at the top and bottom of the band; then chalk the surface of the brown paper thoroughly so as to form a broad continuous ring of chalk all round, and if the chalking is well done no ant will pass over it. Grease banding, as for the winter moth, would probably serve the same purpose and prevent the ants from climbing the trees.

DISEASED TOMATOES. — W. H. F., Bristol The fruits sent are suffering from an attack of black rot (Macrosporium tomato), a fungus that gains entrance to the fruit by means of the most minute puncture of the skin. In damp, cool seasons, and in unheated houses that are kept close during continuous dull weather, the disease frequently makes its appearance. Remove and burn all affected fruits, and spray with a weak solution of sulphide of potassium to prevent the fungus from gaining a foothold.

NAMES OF PLANTS.

K. M., Mill Hill.—1, Trachelium cærulum; 2, Calceolaria amplexicaulis.

B. S., Coniston.—1, Spiræa aruncus; 2, Iris Kæmpferi; 3, I. florentina; 4, Campanula garganica.

M. A. F., Epworth.—1, Fuchsia triphylla; 2, Ostrowskia magnifica; 3, Kalmia latifolia; 4, Cestrum elegans.

R. W., Frome.—1, Cattleya Loddigesi; 2, Sobralia macrantha; 3, Monstera deliciosa; 4, not recognised; 5, Gymnogramma Matthewsi.

C. S. S., Rottingdean.—1, Adiantum cardiochlæna; 2, Lygodium dichotomum; 3, Asplenium lucidum; 4, Helenium Hoopesi; 5, Bahia lanata; 6, Deutzia crenata fl. pl.

THE BEST CABBAGE FOR PRESENT SOWING.
SUTTON'S FLOWER OF SPRING.
Per ounce, 1s., post free.
"I have a bed of 900 of your Flower of Spring Cabbages, which were nearly fit to cut at Christmas. Although all green stuff suffered from the severe winter, these cabbages survived the ordeal, and I am now cutting nice heads, which are very much appreciated.—(March 22nd.)" Mr. H. Harris, Gardener to E. M. Eversfield, Esq.

SUTTON AND SONS, THE KING'S SEEDSMEN, READING.

KELWAY BORDERS.
A perfect picture in your garden to last for years will be the result if you allow us NOW to plan a scheme, whether of contrasts or of harmonies, to be carried out in September this year. Our "Artistic" Border, 50 yards by 10ft., costs £12 10s. only.
Consider what is "saved" in heat and labour by this system, and what is gained in true beauty.
KELWAY and SON, The Royal Horticulturists, Langport.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WEED KILLER used once a year "No weeds can live." RICHARDS' ARSENATE OF LEAD for all leaf-eating insects. CUCASA (fungicide), the finest preparation of copper ever offered to gardeners. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London. S.E.

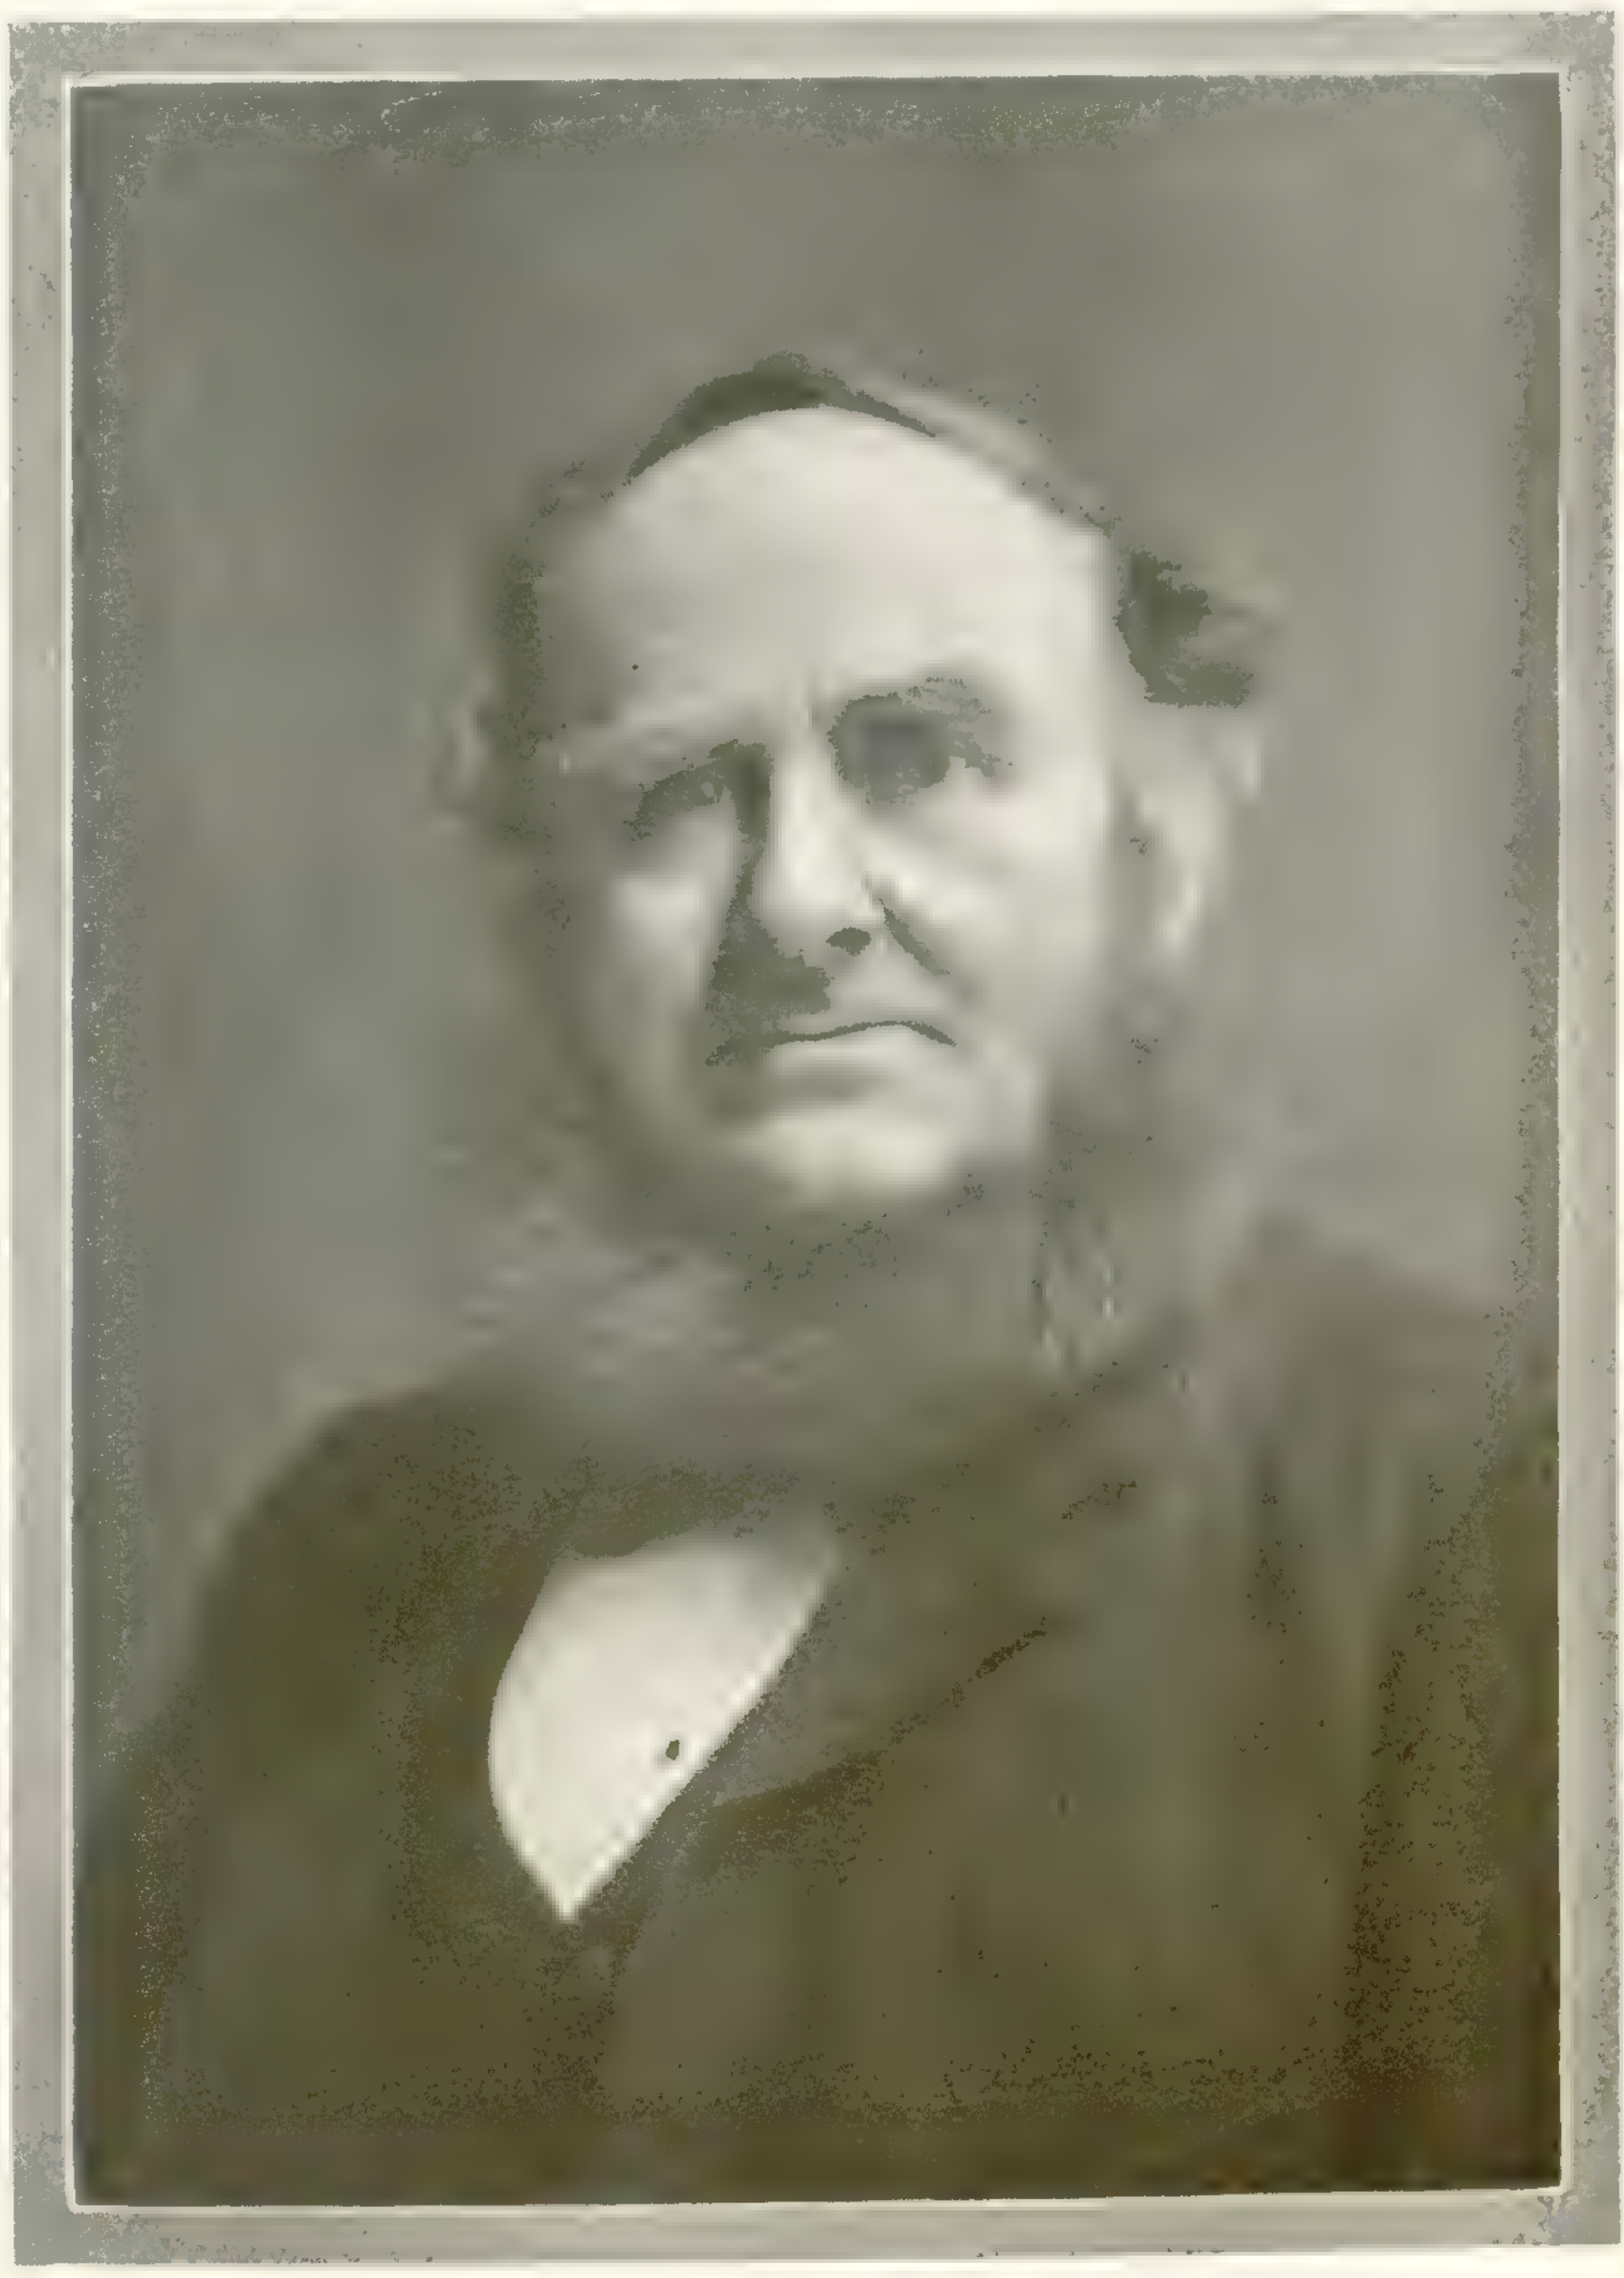
NOTES OF THE WEEK.

Spores.

Spores belong to the category of things amid which we live, move, and have our being, which pervade our environment in unimaginable myriads, and yet the vast majority of us may never see one, or even be aware of their existence. Seeds, as we know, vary much in size, and in some cases are very small, like fine dust, but spores are so much smaller that they can only individually be discriminated under a good lens, and some of them require a very high power indeed. Nevertheless, despite their minuteness and apparent insignificance, they are very wonderful little bodies indeed, since, however minute, in each one is locked up pro tem. the power of producing the parental form of the vegetable whence it was derived, just as perfectly as a seed. Practically, it is a cell imprisoned in a protecting skin or husk, but it differs from a seed, since this cell has not been fertilised, and hence cannot produce the parental form direct, but only in a roundabout fashion. The spore producing plants are extremely numerous, embracing all the seaweeds and the lower classes of land plants, such as the lichens, which form crusts upon rocks; marchantias, etc., which invade our flower pots in damp greenhouses, covering the soil with flat, bright green leathery growths bearing little cups full, not of spores, but of loose buds, and jutting out into spore-bearing columns like dwarf turnstiles or spindle-legged tables; the mosses in all their delicate variety; the horsetails or equisetums, with their stiff-ribbed stems and regular whorls of branches; and last, but not least, our wonderful wealth of ferns, with their diverse frondage and range of size, from a tiny grasslike tuft to a wide-spreading majestic tree. In all these cases spores are produced in incalculable numbers. A full-sized tree fern may yield every season many thousands of millions, and yet every one will be as capable of producing a tree fern to match as the huge cocoanut on a not very dissimilar palm, whose fruits may be reckoned by the score only. Despite, however, this great disparity of numbers, and the consequent apparently reduced chance of the palm to reproduce itself on a large scale, the minuteness of the spore is so great a handicap in the start for existence that it is only one in many millions that succeeds in its mission, since despite its innate capacity to fulfil it, it is at the mercy of a thousand destroying factors, while the huge cocoanut, if it escape the monkey or the land crab, or man himself, is fairly sure to hold its own and establish itself as a palm tree. Spores, however, by virtue of their minuteness and multiplicity, possess the advantage of wider dissemination than the heavier seeds. They are practically ubiquitous, especially those produced by the great family of the fungi. The very air we breathe is peopled by them, and it is due to this pervasive quality that we have only to expose some dead organic matter to the atmosphere in order speedily to find it invaded by deposited spores capable of forming colonies of their particular breed upon it, and thus creating new centres for further propagation and dissemination of their kind. Nay! as we know to our cost, the organic matter may not even be dead, but only weakly, to fall a prey to the invaders; our very veins are a constant battlefield between the inhaled life germs of microscopic foes and the defending life germs in our blood, which have been beneficently provided for their destruction. A wound inflicted in our flesh forms at once the scene of a potential invasion, which the wise physicians of these enlightened days baffle by antiseptics or germ killers. The bruised leaf on our pet plant becomes at once a point of attack, and the weakness induced by high cultivation and unnatural methods of propagation gives rise to many devastating diseases, solely due to spores, which are, so to speak, ever on the watch for a chance. Fortunately for mankind, the more the life histories of the inimical germs are investigated and established, the greater becomes our power of frustrating their attacks, since there is nearly always some weak point in the cycle of existence by which, when ascertained, we can baffle them. These foes, too, have their own internecine warfares, and we are thus sometimes enabled to profit thereby when once our scientists have grasped the situation.



MR. JAMES GRIEVE.

Mr. James Grieve.—It is with very great pleasure we present in this issue the portrait of one of the most famous of Scottish florists. No one who has had associations with the exhibitions of the Royal Caledonian Horticultural Society and the Scottish Horticultural Association during the last quarter of a century can fail to know Mr. James Grieve, for he has a happy knack of making friends with all horticulturists who visit the shows in the Scottish capital, and a hearty welcome from such a sturdy and genial Scotsman soon makes one feel at home. Mr. James Grieve has for many years been associated with the nursery and seed trade, and was manager to one of the principal Scottish firms ere he commenced business for himself. He has always been a very keen florist, and holds strong views upon the correctness of form and marking in pansies, violas, tulips, pentstemons, dahlias, etc. He has been very successful as a raiser of flowers, and that very useful early apple, named James Grieve, indicates the interest he has taken in pomology. Mr. Grieve has been a member of the council of the Royal Caledonian Horticultural Society, and has, in other ways, rendered great service to horticulture in the North.

Vegetable Imports. — The imports of vegetables during the first six months of the year were rather smaller than those in the corresponding period of 1908. Of potatoes the imports amounted to 2,607,657 cwt., of the value of £1,070,034, and of the total 1,169,669 cwt., of the value of £537,741, were received from the Channel Islands. The imports of onions were 3,105,833 bushels, of the value of £626,179, or a decrease in quantity of about 1,000,000 bushels, and in value of about £136,000. The imports of tomatoes amounted to 522,165 cwt., of the value of £427,623. In the value of unenumerated vegetables there was a material increase, the total for the six months being £298,649.

Wolverhampton Floral Fete.—The "coming of age" of the great horticultural gatherings at Wolverhampton was celebrated on Tuesday and two following days, and the exhibition associated therewith was a splendid success, although the weather was far less favourable than could have been wished. There was a magnificent display of plants, flowers, fruits, and vegetables, arrangements as near perfection as one can hope to see; and among those who have been actively engaged in carrying out the fêtes there was a strong sense of satisfaction with the result of past efforts, and a feeling of hopefulness with regard to the future. The committee, as stated in our report, marked the event by materially augmenting the schedule; and they also showed their appreciation of the services rendered by Mr. Alderman Craddock, the chairman of the committee, by presenting him with a handsome silver rose bowl. The presentation was made at the luncheon on Tuesday, by the Mayor of Wolverhampton, who presided. In handing the bowl to Mr. Alderman Craddock, the Mayor mentioned that he had been connected with the committee from the first, and had rendered yeoman service, the last five or six years as chairman.

Pæonies from Langport.—A large gathering of the flowers of herbaceous pæonies which Messrs Kelway and Son have kindly sent us, indicate in no uncertain manner the great interest and the wondrous display of colour the extensive quarters devoted to these flowers in the Langport nurseries afford at the present time. From the varieties included in the collection of flowers, which produce a charming effect on our table, the following have been selected for their exceptional excellence: Ethelreda, deep rose; Limosel, red rose; Summer Day, cream-white; Kitty Green, pale pink; Lady Esther Smith, creamy-white, an elegant variety with anemone centre; Sophia Miller, a distinct variety, with pink guard petals and white centre, Duchess of Somerset, silvery-pink; Lord Avebury and Cavillaria Rusticana, two handsome crimson varieties; Rev. W. Wilks, blush, with deeper centre; and Kelway's Queen, blush-white. The whole of the varieties mentioned belong to the double-flowered section.

Brussels International Exhibition.—As previously announced in these pages an international exhibition on an exceptional scale will be held at Brussels from May to October next year. Unusual importance attaches to the British section, and manufacturers and other exhibitors have to consider in regard to it a totally new situation. For the first time what may properly be called a representative national exhibit is to be attempted, and this is being organised on novel lines. Exhibitors are no longer to be dependent on a voluntary committee, or left to instal their goods as best they can, or required to defray the cost of a general scheme of decoration, or engage in a speculation the cost of which they cannot ascertain beforehand. The section is in charge of a new department of the Board of Trade, which has been placed under the charge of Mr. Wintour, acting in touch with them and taking responsibilities for these matters. Agriculture and horticulture will, it is believed, be strongly represented, as, in addition to the permanent display, special exhibitions will be held at intervals during the period over which the exhibition will extend. The Royal Commission for Great Britain is influentially constituted, and the committee on agriculture, horticulture, and food products includes the following co-opted members of the Commission: Mr. Charles Adeane, Mr. E. A. Bowles, Mr. Edward Brown, Mr. W. A. Bilney, Mr. T. Bevan, Mr. Richardson Carr, Sir Gilbert Greenall, Bart., Mr. A. J. Giles, Dr. Otto Hehner, Mr. A. W. Last, Mr. R. N. Leonard, Mr. T. H. Middleton, Sir Daniel Morris, K.C.M.G., Mr. H. B. May, Mr. H. A. Newton, Mr. A. B. J. Norris, Lieut.-Colonel Prain (Royal Botanic Gardens), Mr. C. Harman Payne, Mr. A. G. L. Rogers, Mr. Arthur Sutton, Mr. Harry Veitch, and Mr. J. W. Wheeler-Bennett.

Holland Park Show.—Owing to a slip of the pen in the preparation of our report of the Holland Park Show, Mr. W. H. Page, of the Tangley Nursery, Hampton, did not receive the credit to which he was entitled for his fine exhibit on that occasion. The credit was given to another exhibitor, and we hasten to make the correction thus prominently. Mr. Page had, in his customary style, beautiful displays of liliums, spiræas, Dorothy Perkins and other rambler roses, and a glorious lot of perpetual carnations, set up in great stands and vases, these forming, as stated in our report, "a splendid exhibit."

Fruits of Foreign Growth were imported in somewhat larger quantities during the six months ending with June last than during the first half of the two preceding years. The increase would have been very considerable had there not been a large decrease in the apple imports. The imports of apples aggregated 1,115,330 cwt., of the value of £811,303, or a decrease in quantity of about 400,000 cwt., and in value of nearly £200,000. In the imports of apricots and peaches there was also a decrease, the quantity having been 2,107 cwt., as compared with 4,003 cwt., but the value was higher, the figures for 1909 and 1908 being £11,523 and £11,406 respectively. Banana imports aggregated 3,111,999 bunches, of the value of £871,831, these figures showing substantial increases. Of cherries the imports were much larger than in the first six months of last year, and amounted to 119,029 cwt., of the value of £170,137, these figures representing an increase in quantity of about 30,000 cwt., and a decrease in value of nearly £17,000. Currants were imported in largely increased quantities, the total having been 14,132 cwt., of the value of £16,939. In the imports of gooseberries there was a decrease of about 1,000 cwt., the aggregate having been 17,646 cwt., of the value of £9,504. As compared with the corresponding period of last year there was a material decrease in the imports of grapes, the quantities having been 9,993 cwt., as compared with 15,923 cwt., and the value £46,939, as compared with £64,424. There was a decrease in the imports of lemons and nuts, and an increase in the imports of oranges, the latter aggregating 1,561,1[illegible] cwt. of the value of £1,824,719. In the imports of pears there was a substantial increase, the total being 18,711 cwt., of the value of £31,420. Plums also were received in increased quantities, the total being 2,023 cwt., of the value of £9,703, as compared with 1,177 cwt., of the value of £2,526, in the corresponding period of last year. Of strawberries the imports were 36,398 cwt., of the value of £47,682, these figures representing an increase in quantity of about 7,000 cwt., and in value of about £5,000. The value of unenumerated fruits was £55,252, as compared with £45,240 in the first half of last year.

Epping Forest.—Especially attractive was this magnificent open space when a few days since, it was visited by the Epping Forest Committee and a large contingent of friends, including many ladies. At the dinner which followed the inspection of Wanstead Park and the forest, the chairman, Mr. Deputy Cuthbertson, presented the late chairman, Mr. Deputy D. Matthews, on behalf of the Epping Forest Committee, with a handsome rose bowl, as a souvenir of his year of office. The latter, in acknowledging the gift, spoke in high appreciative terms of the manner in which Mr. A. McKenzie, the superintendent, discharges the duties of his office.

Market Gardeners and the Land Taxes.—At a recent meeting in London of the National Federation of Fruit and Potato Traders' Associations, the following resolution was adopted: "That this federation learns with great dismay that it is proposed to impose further burdens of taxation upon land, and respectfully desires to call the attention of the Chancellor of the Exchequer to the following points affecting the market gardening industry: 1. Market gardeners send daily consignments at a very early hour to populous centres, and are, therefore, compelled to carry on business within the collection and delivery area of railway stations. 2. As market gardeners cannot move further out for the above reason, the effect of the undeveloped land tax on their industry would be to increase the heavy burden already imposed upon them. 3. If market gardeners should succeed in throwing any portion of this increased burden upon their customers, the result would be to increase the cost of two most important items in the nation's food supply —fruit and vegetables. 4. Market gardeners employ more hands pro rata than the ordinary agriculturists, and for this reason should share the exemption from the undeveloped land tax conferred upon every other trade, business, or industry except agriculture. 5. The proposed increment duties will also bear very heavily upon the market garden industry. As building development advances the market gardener has to move, and has to expend large sums on making new greenhouses and other buildings, and especially in heavily manuring the new soil. By selling his interest in the land for more than he gave the market gardener is at present able to provide a fund towards such new [illegible], but on such occasions the industry [illegible] suffer severely if in future the [illegible] insists upon taking 20 per cent. of the increment under the provisions [illegible] Finance Bill."

WOLVERHAMPTON GREAT FLORAL FÊTE,

JULY 13, 14, and 15.

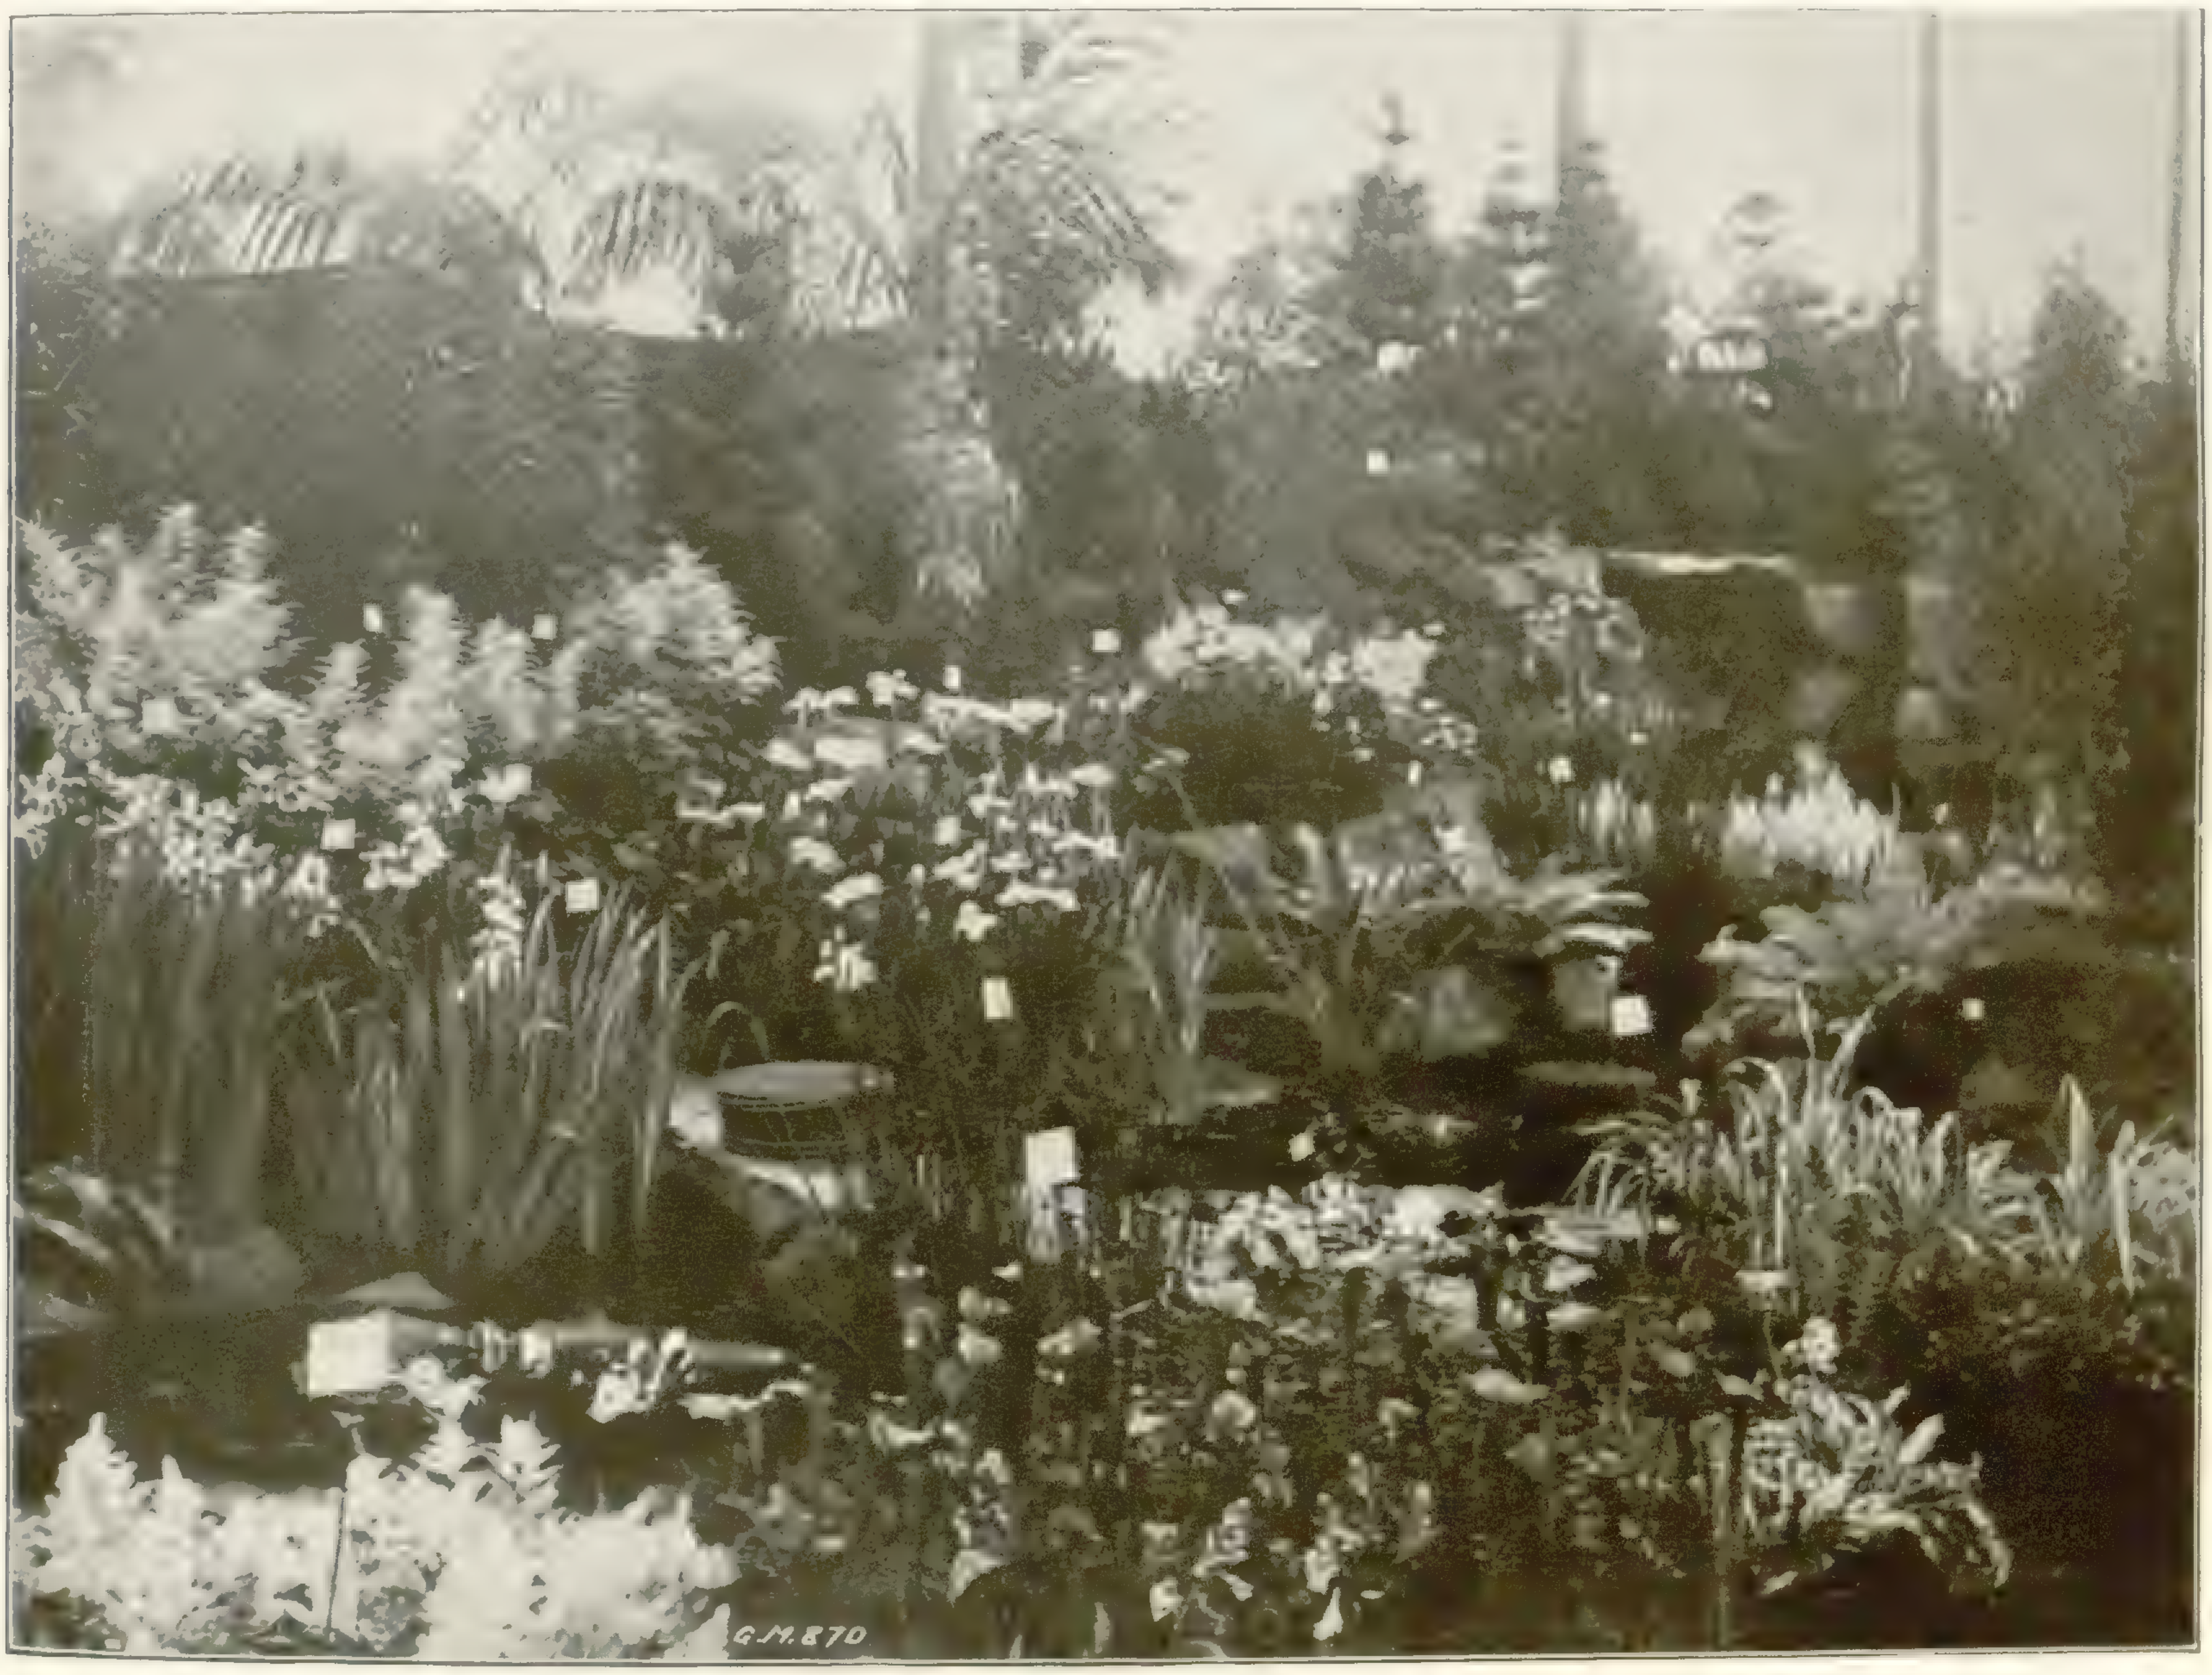
◆

The great floral fête that has been held at Wolverhampton during the past week has been of exceptional interest from the fact that it was the twenty-first of the great gatherings that have brought the town into prominence as one of the more important of the centres of horticultural activity. The fêtes, which are under the management of an influential committee, and are held in one of the most beautiful of the public parks, namely, West Park, have been highly successful from the first, and from the profits upwards of £6,000 have been expended in improving and beautifying this magnificent open space. To mark so important an event as the coming of age of the fêtes, the committee greatly augmented the schedule by providing new classes and adding to the value of the prizes in the leading classes that have had a place in the arrangements for some years past. For example, the prizes in the class for a display of miscellaneous plants were increased to £100; those in the class for a group of fine foliage plants to £57; for seventy-two roses, to £42; for an arrangement of hardy border flowers, to [illegible]; for a collection of fruit trees in pots, to £44, and so on. The show was throughout of a high order of merit, and it would be difficult to speak too appreciatively of the admirable manner in which the arrangements were carried out, or of the services rendered by Mr. Alderman Craddock, the chairman of the Committee of Management; Mr. F. T. Beck, chairman of the horticultural section; and Mr. W. E. Barnett, the secretary, in bringing so important an undertaking to a successful conclusion. The weather, unfortunately, was not favourable, and on Tuesday during the greater part of the afternoon the rains were torrential in character.

GROUPS AND SPECIMEN PLANTS.

For a long series of years groups arranged for effect have constituted a great feature of the Wolverhampton flower shows, for the committee has given such liberal encouragement as to induce exhibitors from far and near to take part in the competition and to do their best. This year the liberality of the prizes was such that in the open class for a display of miscellaneous plants, in or out of bloom, they amounted in the aggregate to £100. The contest was a very keen one, and Messrs. J. Cypher and Sons, Cheltenham, were succesful in winning the premier prize of £40 with an arrangement that quite surpassed all their previous efforts, which, as so well known to our readers, have been great. To describe so beautiful an arrangement in a manner that would convey an adequate idea of its distinctive character and great charm would be impossible, and no illustration in black and white would do it justice. It may, however, be of interest to mention that along the front Messrs. Cypher had in the centre a light arch tastefully decorated with carnations, and that on the right and left were two small mounds, surmounted by an elegant palm or a richly coloured croton, and clothed with flowering and fine foliage plants. At the back were tall plants and standards of cut flowers, and prominent among the former were finely developed specimens of kentias. The spaces between the mounds, the tall standards, and the specimen crotons and other subjects were filled with the choicest of the fine foliage plants of varying heights, and numerous choice orchids. Conspicuous among the latter were finely flowered examples of Odontoglossum crispum in variety, Cattleyas gigas, Gaskelliana, and Mendeli, Lælio-cattleya Canhamiana, and L.-c. Aphrodite, Oncidium leucochilum, O. flexuosum, and Vanda cærulea, the last-named being especially attractive. Mr. W. A. Holmes, Chesterfield, was second with an admirable arrangement, and Mr. W. Vause, Leamington, occupied the third place with a group characterised by much taste.

The prizes offered in the class for a group of ornamental-leaved plants were also most liberal, the entries were numerous, and on the whole the arrangements were of a high order of merit. The competition was very close for first place between Mr. W. A. Holmes, Brampton, Chesterfield, and Messrs. J. Cypher and Sons, and in the result these exhibitors were awarded the first and second prizes in the order of their names. The second prize group was so remarkable for the high quality of the plants, and also for the taste shown, that it was thought by some of the experts that it might have been placed first. Mr. J. V. Macdonald, gardener to Sir E. H. Kenrick, Edgbaston, was third prizetaker with a remarkably fine group. Mr. W. Vause was awarded an extra prize for a



A BEAUTIFUL BOG, WATER, AND ALPINE GARDEN AT THE WOLVERHAMPTON FLORAL FETE.
Arranged by Messrs. Bakers, and awarded the special prize of £50 for the best exhibit in the show.

meritorious arrangement. There was a good competition in the class for a group of flowering and fine foliage plants arranged by gentlemen's gardeners. The groups ranked high in merit, and the most successful exhibitors were Mr. A. Cryer and Mr. R. W. Manning. **The class for a group of** flowering plants, one kind only (but any number of colours or varieties of the same kind), to occupy a space of 50 feet super., was a very interesting one. There were six or seven entries, and far away from the other groups, excellent as they were, was the collection of tuberous begonias shown by Messrs. Blackmore and Langdon, Twerton Hill Nursery. Bath. The group comprised some well-grown and splendidly flowered plants, **representing about fifty** of the finest varieties in cultivation, these consisting chiefly of the superb forms that have originated with these well-known and highly successful raisers. Messrs. Hobbies, Dereham, were a good second with rambling roses, and Messrs. J. Cypher and Sons were third with heaths.

A CHARMING ROCK AND WATER GARDEN AT THE WOLVERHAMPTON FLORAL FETE.

Arranged by Messrs. Backhouse and Son, who were awarded the large gold medal.

There was but one collection of twenty specimen stove and greenhouse plants, and this was contributed by Messrs. J. Cypher and Sons, who were deservedly awarded the first prize. The collection comprised finely flowered examples of Ixora Williamsi, Chironia ixifera, Ixora regina, Clerodendron Kæmpferi, and other well-known subjects. For six stove and greenhouse plants, Mr. A. Cryer, gardener to J. A. Kenrick, Esq., Edgbaston, was first with large, splendidly flowered specimens of Crassula coccinea, Bougainvillea glabra, Ixora coccinea, and Clerodendron Balfouriana; Mr. W. R. Manning, Dudley, was a good second, with a group in which Allamanda Hendersoni was the most noteworthy specimen.

The first prize for twelve gloxinias was awarded Mr. C. Weaver, gardener to B. H. Mander, Esq., Wolverhampton; second, Mr. T. Whysall, gardener to W. E. Stevenson, Esq., Ashby-de-la-Zouch; third, Mr. J. Dickson, gardener to G. C. M. Mander, Esq., Wightwick. Mr. C. Weaver won for twelve begonias, followed by Mr. A. Cryer, and W. E. Smith, Esq., Great Wyrby.

ROSES.

Roses, for which liberal provisions were made, constituted a very extensive and delightful feature. The competition was not very keen in the amateurs' division, but in that for trade growers the classes were so well filled that it was not an easy task to obtain a high position. In the great class for seventy-two blooms, distinct, in which a sum of £20 was offered as the first prize, the competition was of the keenest, and the premier award was made in favour of Mr. Hugh **Dickson, Royal Nurseries, Belfast.** The blooms throughout were of the largest size, superbly coloured, and finely finished. Especially deserving of mention were those of Mildred Grant, Mdme. M. de Luze, Mrs. William Cooper, Helen Keller, Mme. Leon Pain, C. K. Douglas, Charles J. Grahame, Miss C. Forde, Hugh Dickson, Lyon Rose, Countess of Annesley, Triumph, Lohengrin, Pharisaer, Kaiserin Augusta Victoria, and General Jacqueminot. Messrs. Frank Cant and Co., **Braiswick Rose Gardens, Colchester,** were a close second with blooms hardly so large in size as those in the first-prize collection, but well finished, and rich in the high coloured varieties; Messrs. R. Harkness and Co., Hitchin, who were third, also staged blooms of great merit. There were five competitors in the class for forty-eight blooms, and, notwithstanding the unfavourable weather that had obtained some time previously, the blooms were throughout of a high degree of merit. At the head of the competitors were Messrs. J. Townsend and Sons, Worcester, with an excellent set, in which Hugh Dickson, Mdme. Melanie Soupert, Robert Scott, Mildred Grant, Her Majesty, Oberhofgartner Terks, Captain Hayward, Bessie Brown, Florence Pemberton, and Pharisaer were conspicuous; the second and third prizes were awarded to Messrs. Perkins and Son, Coventry, and Mr. Hugh Dickson.

In competition for the prizes for twelve roses, three trusses each, Messrs. J. Townsend and Sons occupied the first place with a good set of blooms, and Mr. Hugh Dickson, Messrs. R. Harkness, and Messrs. Frank Cant and Co. were second, third, and fourth respectively. Still more spirited was the contest for the prizes for twenty-four blooms, and Mr. W. T. Mattock, Headington, Oxford, scored with a set remarkable for the large size and finish of the blooms; Messrs. J. Townsend and Sons followed closely for second place; and Mr. E. J. Hicks, Twyford, Berks, was a very close third.

New roses were well staged, and in the class for twelve varieties, introduced within the past three years, Mr. Hugh Dickson was first with finely developed blooms of the Lyon Rose, Reve Wilwart, Urban, Mdme. Segond Weber, Mrs. Aaron Ward, Laurent Carle, Lady Helen Vincent, Milly C[illegible], Harry Kirk, Baron A. von Biel, H. Armitag Moore, Lady Ursula, and Comtesse I[illegible] Harding; Messrs. Perkins and Sons were a close second; and Messrs. R. Harkness and Co. third.

There was a long line of boxes in competition for the prizes for twelve blooms of any dark rose, and here the first place was occupied by Mr. Hugh Dickson with medium sized and superbly coloured blooms of Hugh Dickson; and Messrs. J. Townsend and Sons were second, and Messrs. R. Harkness and Co. third with the same variety. Not less keen was the contest for the prizes for twelve blooms of any one light rose, and here Messrs. J. Townsend and Sons occupied the premier position with **Bessie Brown in a high** state of development; Her Majesty secured for Messrs. Perkins and Sons the second prize, the blooms large, fresh, and well coloured, and Mr. H. Dickson, who was third, staged Mrs. Theodore Roosevelt in capital condition.

Garden roses constituted a large and most attractive feature, the flowers generally being of high quality and good colour. Mr. **J. Mattock, New Headington,** scored in the **class for nine varieties with a fine set; Messrs. Frank Cant and Co. were a close second with a beautiful collection that was of much interest, as it admirably represented the several classes of roses best adapted for the decoration of the garden.**

Bowls of roses were **highly attractive, and the premier award was made in favour of** Mr. W. J. Garner, Hale, near Altrincham, who had a bold arrangement of flowers of Caroline Testout; Mr. E. Hicks was a close second with a charming arrangement of flowers of teas and hybrid teas; Messrs. J. Townsend and Sons were third with a daring arrangement of crimson and white roses. The class for a vase of roses was a good one, and **Mr. E. Hicks was a splendid first** with a de**lightful arrangement of pink teas; Mr. W. J. Garner followed for second place, and Messrs. Perkins and Sons** were third.

Messrs. Hobbies were the only **exhibitors in the classs for climbing roses in pots, and** staged a collection that well **merited the first** prize that was awarded. The plants ranged from three to four feet high, and were splendidly flowered, Minnehaha, Tausendschön, Delight, Hiawatha, Paradise, and Dorothy Perkins being conspicuous among the varieties **represented in the group.**

Teas and noisettes were represented by numerous collections in the class for twelve blooms, and the blooms were throughout remarkable for their high quality. Mr. W. T. **Mattock was successful in taking premier** honours with finely developed blooms of Mrs. Edward Mawley, White Maman Cochet, **Muriel Grahame, Medea,** Catherine Mermet, **Madame Jules Gravereaux, Comtesse de Nadaillac, Mme. Vermorel, and other of** the finest varieties. **Messrs. Frank Cant** and Co. had a remarkably fine set for the second place, and Mr. John Mattock was a good third. The class for nine varieties, [illegible] blooms of each, and arranged in vases, was a good one, and the first and second prizes were awarded to Mr. W. T. Mattock and Mr. J. Mattock, both of whom staged well.

There was a fine display of roses in the tent devoted to the productions of amateurs, although some of the classes were not so well filled as could have been wished. Mr. [illegible] Foley Hobbs, Worcester, was exceptionally successful, his blooms being throughout in a high state of development. He was successful in obtaining premier honours for thirty-six blooms; for six varieties, three blooms of each; for twenty-four blooms, distinct, for twelve blooms, distinct, and for twelve [illegible] scented and noisettes. In the classes [illegible] to growers resident within twelve [illegible] of Wolverhampton the more successful [illegible] exhibitors were Mr. W. Froggatt, [illegible]ford, Tettenhall; Mr. John Smith, gardener to Walter Marchant, Esq., of Shifnal, and Mr. W. Parkes, Gatacre Park.

SWEET PEAS.

Sweet peas made a fine display [illegible]standing the unfortunate clashing [illegible] with the National Sweet Pea [illegible] vincial show at Saltaire. In the class for eighteen varieties Mr. T. Jones won with a splendid lot, Audrey Crier, Olive Bolton, and Evelyn Hemus being especially noteworthy. A close second was Mr. A. E. Usher, gardener to Sir R. Baker, Bart., Blandford; third, Messrs. Hobbies, Lim., Dereham; fourth, Mr. W. Marple, Penkridge. In Mr. Eckford's class for twelve bunches, Mr. Usher led with splendid blooms of a dozen really good varieties. Mr. J. Haycock, Ruabon, second. In Mr. Robert Sydenham's class the lead was again taken by Mr. Usher, with Mr. T. Parry, gardener to Mrs. Chappell, Warwick, second. Mr. H. B. Howe, Leicester, third, and Mr. Hickman fourth. In the same firm's class for six varieties Mr. Haycock led, his varieties being Etta Dyke, Paradise, Clara Curtis, George Herbert, Evelyn Hemus, and Black Knight; Mr. W. H. Shaw, gardener to A. Ashworth, Esq., Gresford, was second, and Mr. W. H. Holloway, Shrewsbury, third. Mr. H. Taylor, gardener to the Right Hon. Lord Hatherton, Penkridge, fourth. Messrs. Baker's class for six varieties sweet peas brought three entries, Mr. Usher being the most successful competitor, followed by Mr. T. Jones and Mr. W. H. Shaw for second and third places in the order named. Messrs. Webb's class was also led off by Mr. Usher, Mr. W. H. Shaw being second, and Mr. H. Davis, gardener to Watson Smith, Esq., Stourbridge, third.

In the amateurs' class for twelve bunches of sweet peas Mr. Usher secured the leading position, and Mr. T. Parry took second place, with Mr. F. Stead, Wolverhampton, third.

DECORATIONS.

In the class for a bridal bouquet (with orchids) and two bridesmaids' bouquets (without orchids) the first prize was awarded to Messrs. Perkins and Sons, North Western Arcade, Birmingham. The bride's bouquet of white odontoglossums, pancratiums, and lily of the valley, and the two bridesmaids' of Mrs. Burnett carnations and lily of the valley, were exquisitely built. Mr. W. J. Garner, Hale, near Altrincham, took second, and Mr. J. E. Knight, Wolverhampton, third. For a featherweight bouquet Messrs. Perkins and Sons, again led, using oncidiums and odontoglossums, Mr. Garner's spray-like arrangement of mixed orchids being second, and King's Acre Nurseries, Lim., third. Mr. F. Jenks, Codsall, used sweet peas, with which he secured fifth prize.

A popular class, which brought eight entries, and proved a great attraction to the lady visitors, was that for a dinner table decoration. The judging of this class was a very difficult task, but after careful scrutiny the coveted award was given to Messrs. Townsend and Sons, Lower Broadheath, Worcester. The scheme was carried out in amber-shaded roses, and a few blooms of deeper shade, with francoa, gypsophila, and light foliage. Mr. W. J. Garner, Altrincham, secured second with gloriosas and a few white flowers, garnished with Asparagus plumosus. Glass and cutlery were used on this table. Mr. S. Coster, Handsworth, was third with roses of yellow and bronze shades, trails of selaginella being used as embellishments. Miss M. Clarke, Birmingham, came fourth with a very delicate arrangement in flesh-pink and white, a mirror being used as centrepiece.

In a similar class excluding florists and their assistants, there were six competitors, the lead being taken by Miss F. Jenks, Codsall. The flower used was sweet pea Miss [illegible], and maidenhair fern and selaginella were used as foliage. Second prize went to Miss M. Clarke, Birmingham, pink carnations being chiefly used. Similar flowers gained third for Mr. J. Warwick, Derby; Miss Ethel Barnett, Wolverhampton, being fourth with Plumbago capensis and yellow sweet peas. Mr. A. Cryer scored for a collection of decorative plants and bunches of cut flowers; Mr. R. Maybury, gardener to J. Evans, Esq., Wolverhampton, second; and Mr. J. F. Simpson, gardener to Lieut.-Col. Mander, Compton, third.

For a stand of cut flowers for table, first prize went to Mr H. Blakeway, Rugby, for an elegant arrangement of gloriosas. Mr. J. Phillips, gardener to R. E. W. Benington, Esq., Wolverhampton, was second with carnations, and J. A. Warrick, Esq., Derby, third with sweet peas.

HARDY FLOWERS.

The class for a collection of hardy border flowers constituted a feature of much interest and attraction. Messrs. G. Gibson and Co., Leeming Bar, Bedale, scored with a well-arranged asortment of showy and popular subjects, such as delphiniums, pæonies, oriental poppies, verbascums, and liliums, with campanulas, potentillas and other smaller things in the foreground. They were closely followed by Messrs. J. Harkness and Sons, Bedale, who had glorious delphiniums and gaillardias as well as many other good things. Third prize was awarded to Messrs. G. Bunyard and Co., Lim., Maidstone, for a very fine collection. For a collection of delphiniums, occupying six feet by five feet, staged naturally with full length of stem, Messrs. Blackmore and Langdon led off with a really marvellous collection, embracing the very cream of these stately and lovely flowers. Among the rich blues there stood conspicuous Harry Smethum and Novelty, while the rosy lilac of Lilacina and the lavender of Twertonian added a pleasing variety. Second place was well secured by Messrs. G. Gibson and Co., some extra fine seedlings being prominent on this stand. Mr. A. Cryer, gardener to A. Kenrick, Esq., Edgbaston, was third. In the collection of hardy flowers, occupying eight feet by five feet, Mr. C. Holder, Birmingham, was first, and Mr. G. Hollis, gardener to F. Bouskell, Esq., Market Bosworth, second. For twelve kinds of hardy flowers Mr. J. F. Simpson, Compton, led with some bright and telling bunches of popular things; Mr. G. Hollis followed with a nicely arranged collection, and Mr. C. Holder was third.

An attractive class was that for an arrangement of pansies and violas on a stage seven feet by three feet, the lead was taken by Messrs. W. Pemberton and Son, Bloxwich, whose blooms of grand quality were arranged in glass vases in a most artistic manner. A large mirror formed an effective background, in front of which the flowers stood out to show their merits to the full. Second place was secured by Messrs. Bostock and Son, Moseley, Birmingham, who adopted a similar but slightly heavier style of staging; third, Mr. W. Chipman, Birmingham.

MISCELLANEOUS CUT FLOWERS.

For twelve cactus dahlias, distinct, there were five entries, the blooms at this early season being rather small. Mr. F. Lea, Stourbridge, secured first; Mr. G. Burgess, Wolverhampton, second; and Mr. J. T. Broadhead, Bushbury, third.

FRUIT AND VEGETABLES.

Prizes of a liberal character were offered for a display of fruit trees in pots, and Messrs. Rivers and Son, Sawbridgeworth, received the premier award of £20, with an added prize of £5 contributed by Mr. Alderman Craddock, for a collection that fully sustained their high reputation as cultivators of fruit trees in pots; the collection comprised about fifty trees, and included the finest of the peaches, nectarines, cherries, plums, oranges, shaddocks, grapes, and figs, with several of the best dessert apples, especially noteworthy among the latter for its brilliant colour was Lady Sudeley. The peach trees included four finely formed pyramid trees of Duke of York, carrying heavy crops of fruit in a perfect state of maturity. The trees had been grown from the beginning of the season in an unheated house, and were therefore of special interest as indicating the usefulness of the variety for growing under glass without the aid of fire-heat. The second prize was awarded to the King's Acre Nursery Company, Hereford, for a good collection.

Mr. J. Doe, gardener to Lord Savile, Ollerton, secured first prize for eight dishes of

A FINE GROUP OF TUBEROUS BEGONIAS

Exhibited at the Wolverhampton Floral Fête by Messrs. Blackmore and Langdon, who were awarded the first prize in the class for a group of one kind of plant, without restriction as to number of varieties.

fruit. His collection comprised grand bunches of Madresfield Court and Muscat of Alexandra grapes, a good seedling melon, Brown Turkey figs, and excellent peaches and nectarines. Mr. W. Parker was second with a collection including apples as well as the fruits already named. For four bunches of grapes, Mr. J. Doe led with Black Hamburgh and Buckland Sweetwater; Mr. W. Parker second. Mr. Doe led for two bunches of white, and again for two of black.
